[766.]—SMOKY CHIMNEY.—Will you allow me to suggest to "Smoky," as a remedy for the evil he complains of, the putting of a tall-boy upon the top of the chimney marked A in the cut. The case he mentions has often come under my notice, and I have known the experiment to succeed perfectly.—FLUE.

[767.]—THE BUILDING ACT.—I do not think the District Surveyor could interfere in the case put by "Building Owner." It is his duty to prevent buildings being erected contrary to the act; but if he allows them to be put up he cannot serve the parties with a notice for infringement two years after.—CLERK.

[767A.]—BEAD AND FLUSH FRAMING.—In answer to Mr. Gilbert R. Redgrave's question in your Intercommunication column last week, I think he is right. It certainly would be the best way, and for the matter of time, I, or any joiner, could do it the one way very nearly as quick as the other. His way has, in my opinion, all the advantages he mentions; and, besides, it is "truth," and does away with the abomination—sprigging—at very little extra cost.—A JOINER.

[767A.]—In reply to the correspondent, I maintain the bead should be worked upon the panel, not the framing, for this reason—when the bead is worked upon the framing, and the rail shrinks, the mitre opens, and our old friend, the painter, is called upon to stop the gap; but when worked upon the panel, the shrinkage of the panel compresses the mitre, and the services of our friend, the painter, are not required.—W. N. ATKINSON.

[770.]—SMOKY CHIMNEYS.—In answer to "R. F. S." I beg to say that, having to replace a broken chimneypot on a cottage flue, the labourer was directed to put up an ordinary 6in. drain pipe, but not having one, he used a 6in. pipe with a 4in. skew junction, and that it has completely cured the chimney of smoking, it having been at times before intolerable. Since then I have adapted it to other chimneys with the like success.—R. JOHNS.

WAGES MOVEMENT.

At a meeting of the Operative Masons' Society, held on Monday, the 9th inst. at Nottingham, it was resolved, by a small majority, to withdraw the notice given in January last for a reduction of five hours per week with working time; and an intimation to that effect has already been received by the local builders.

On Monday last a conference was held at Birmingham between a number of the master builders and the labourers of the town to discuss the notice received from the latter for an increase of one farthing per hour upon the current rate of wages. At present, the wages are 4¼d. per hour, or 20s. per week in summer, and 17s. 10d. in winter, for 56½ and 50½ hours' work respectively. The men supported their application by arguments of increased cost of living and provisions, while the masters stated that the depressed state of trade would not warrant any increase, and pointed out the fact that they spontaneously gave an addition last year of one farthing per hour to them in common with the other trades; and, in the face of the fact that their scale of prices were arranged for this year's work, they could not accede to the men's request. The conference then closed, with the understanding that if the labourers were not satisfied they would submit the name of some gentleman whom they would be willing to accept as an umpire, with the view of submitting the question at issue to the decision of a court of arbitration.

STAINED GLASS.

Messrs. E. and S. Beer, of Exeter, have just completed a memorial window for a North Devon Church. The subject represents the four scriptural acts of saving charity. They have also just finished a three-light window for another North Devon church, representing SS. Mary the Virgin and Mary Magdelene.

The new east window of St. Michael's Church, Basingstoke, has been filled with stained glass by Messrs. Lavers, Barraud, and Westlake. The subject is the Ministry of Angels, illustrated by the five principal events of the Annunciation, the Nativity, the Crucifixion, the Resurrection, and the Ascension. Beneath these are five minor events—the Angels visiting Abraham, St. Michael contending with Satan, Daniel in the lion's den, and the Translation of Elijah.

A stained glass window has been erected in the church at Fawley, Hants. The subject is Our Saviour's charge to St. Peter—"Feed my sheep: feed my lambs."

LEGAL INTELLIGENCE.

PLUMBER'S SPECIFICATIONS DEPARTED FROM.—Gee *v.* Wilson.—The plaintiff, a painter and plumber at Stafford, brought an action against the defendant, the patentee of "Wilson's Hot Water Apparatus," in the County Court at Stoke, to recover the sum of £8 5s., damages arising from a patent copper cylinder, supplied by the defendant, being defective. Plaintiff, it seemed, was engaged in 1867 to do the whole of the painting, glazing, and plumbing at a house built at Hartshill. Amongst other work was the erection of the patent apparatus, which had been invoiced to him. After it had been fixed it was found that it would not work. The consequence was that there was considerable loss of time occasioned to the plaintiff, who had to go from Stafford to Hartshill several times, and claimed on that account £2; a plumber had to be engaged seven days at 5s. a day, bricklayers and others had to be employed, and the total amount of the expenses thus incurred amounted to the sum claimed. The defence was that there was no defect in the cylinder up to the present time, and that the plaintiff had not properly erected it in the first instance. The Judge, after hearing the evidence, gave judgment for the defendant, considering that, in erecting the apparatus, there had been a departure from the specifications.

STRANGE CONDUCT OF A LOCAL BOARD.—Bragg and Another *v.* Lidstone.—The plaintiffs were builders and contractors, and the defendant was clerk to the local board at Paington, Devon. It appeared that the board had accepted the tender of the plaintiffs to erect buildings and offices for £2,174, and when the architect certified that a certain sum was due, pleaded their inability to enter into a contract with the plaintiffs. Mr. Cole, who appeared for plaintiff, said the board was constituted in 1863, they wanted offices, and were desirous of combining them with local police and other offices. In September, 1863, after the present contract was entered into, four of the members retired by rotation, and four agricultural gentlemen were elected. These gentlemen were opposed to a large expenditure on public works, and at a full board it was determined to repudiate the contract. Mr. Coleridge, appearing for the defence, stated that the only parts of the works needed by the board were a collector's room and offices, and with all the rest the ratepayers of Paington had nothing to do with, being entirely erected for county purposes. He might be prepared afterwards to admit the liability of the board to pay for such portions as were necessary for their purposes, but that would be a matter for arrangement. It was stated that Mr. Belfield, the late chairman of the board, was the owner of the land on which the buildings were erected. The judge deprecated further litigation in the matter, and said Mr. Belfield had the power to compel the board to do substantial justice, for he might say if they repudiated the contract they should repudiate the lease, and so prevent them from going on with the buildings. He suggested that it was possible that Mr. Belfield might be induced to consent to an arrangement by which the land that was really required for the purposes of the board should be granted to them, and the rest of the land and building turned into account some other way. His lordship's suggestion was adopted, and a verdict was accordingly taken for the plaintiff by consent, subject to a special case.

Our Office Table.

In consequence of the great complaints made by the public against unauthorized persons who are in the habit of prowling about Westminster Abbey offering themselves as guides, only, however, to exact money and mislead visitors, the Dean and Chapter of Westminster intimate that they are anxious to give every facility for seeing all parts of the abbey to persons of respectability. The nave and transepts are open to the public at all times, from nine to six in summer, and from ten to four in winter. In order to see the Royal and private chapels, any visitor who sends in his address to the Dean or one of the Canons, or who leaves his address at the entrance of the chapels, has permission to see them at leisure. Artists who desire to sketch, on application to the Dean, can obtain the necessary order for a twelvemonth. The disgraceful habit which even educated persons have of touching and disfiguring whatever they ought not to touch, has, we are informed, rendered the superintendence of guides absolutely necessary for the protection of the monuments in the Royal tombs and chapels. The small payment for seeing the chapels forms a fund for paying these guides, who are forbidden to receive any other gratuity. Any surplus is devoted to the decoration of the abbey. For those who can dispense with the explanations of the attendants, guide-books, containing a full account of all the tombs, can be procured within the abbey.

Recent letters from Abyssinia give us some of the native notions of sacred art. The church at Attegrath is ornamented within by rude pictures of saints and incidents in Biblical history, executed without any ideas of perspective. Nor is the absence of art redeemed by antiquity, as they have been finished little more than half a century. Among other errors by the artist, critics have discovered a glaring anachronism in one design. The subject is the passage of the Red Sea—Moses, standing on the farthest bank, is shaking his rod with mocking irony over Pharaoh, whose horse is rapidly being submerged; while the Egyptian infantry, already nearly engulfed, are holding their firelocks over their heads.

Collectors have long disagreed as to what kind of china was made at the first manufacture of this ware in England, which is known to have been established at Bow, in 1744, and what mark distinguished it from that of other manufactures In trenching for a drain at the lucifer match works of Messrs Bell and Black, at Bow, the cutting has intersected a waste heap, and many fragments have been found, consisting of knife handles, cups, and plaster moulds for casting the ornaments in relief. The curator of the Geological Museum has been thus enabled to identify, as of Bow manufacture, two perfect specimens in the ceramic collection of the museum. No distinguishing mark has yet been found in any of the specimens.

A new electric organ is announced. Mr. Barker, organ builder, Paris (who is the inventor of the pneumatic lever), has just patented in France and England a complete system for applying electricity, to supersede the ordinary mechanical key and draw-stop action in large organs. The patentee has already built a grand electric organ of forty-two sounding stops and eight couplers for St. Augustin's, Paris, and another for Salon, near Marseilles. As the largest organs may now be played through a cable of insulated wires, positions hitherto wholly impracticable can be turned to account. The organist, with his various claviers, can be placed in any direction, and at any distance away from the organ, the touch being equally delicate and rapid on every manual, whether used separately or coupled. Bryceson, Brothers, and Co. have the concession for working this patent in Great Britain, either as regards new organs, or applying the electric action to existing instruments.

The next congress of the Archæological Institute will be held at Lancaster in July, with the Right Hon. Col. Wilson Patten, Chancellor of the Duchy of Lancaster, in the chair.

The Emperor of the French and Mr. S. Clair-Deville have been working together with a view to the discovery of some means of using petroleum instead of coal, as a generator of steam for locomotives. They have, however, not being able to overcome the explosive qualities of petroleum.

The excavations on the site of the old White Hart Hotel at Bath have brought to light several relics of the past, in addition to those previously mentioned. The most important are a fragment of a fine churchyard cross of rich Norman work, bearing part of an eagle, the emblem of St. John; a solid mass of masonry, believed to have been the raised platform of the Roman temple; a circular well, fifteen feet deep, the walls of which were entirely composed of fragments from the abbey buildings, mostly of Norman and Early English date. In cleaning out the well, the lower portion of a fine Perpendicular column was found, and an interesting collection of fragments of pottery. More recently, the foundation of the south wall of the Roman temple has been discovered, but one course only of the immense stones was remaining. One stone of this course was about five feet in length, and had a sawn face, leading to the inference that the stone-saws used by the Romans could not have been less in length than those used at the present day. Close to this south wall a beautiful glass mask was found, which had been originally attached to a glass vessel; and not far from this locality half of the stone mould for casting metal ornaments, some of which are preserved in the museum of the Literary Institution Bath, was also found.

After two years spent in fruitless communications between the Metropolitan Board of Works, the Metropolitan Railway Company, and the Gas Company, the board have determined to complete that portion of the Embankment between the Temple and Blackfriars-bridge as originally proposed, so that there is, after all, a probability of the present generation witnessing the completion of the undertaking.

We learn that, owing to the exorbitant price—£8,000 per acre—demanded by Sir Thomas Wilson, the negotiations for the purchase of Hampstead-heath for the public have, up to the present time, not been successful. At a recent meeting of the Marylebone Vestry it was resolved that the representatives of the Vestry at the Metropolitan Board of Works should be requested to make a further move in the matter, with the view of bringing it to a satisfactory conclusion.

Some further discoveries of lacustrial antiquities have recently been made in the environs of Faux-Vives, near Geneva, situated on the banks of the lake. Several ornamental objects have attracted special attention.

A correspondent of the *Kent Coast Times* has suggested that a statue should be raised to the memory of the late Augustus Welby Pugin, in Ramsgate. He suggests that £400 or £500 be raised for the purpose.

A new invention has been attracting public notice in the United States, which threatens to supersede the use of common house paper for covering walls. A delicate and simple machine has been constructed, which will take a portion of a tree, after it has been cut the right length and width, and shave it up into thin ribbons as wide as a roll of house paper, making one hundred or one hundred and fifty to the inch. These rolls of wood are placed on the walls by paper-hangers with paste and brush, precisely in the same manner as with paper. The wood is wet when used, and it is found to work easier than paper, because it is much more tough and pliable. Any kind of wood can be selected to suit the taste, and the ordinary kinds are very cheap as well as handsome. The wood can be oiled, varnished, or shellaced, and then washed at pleasure, and thus kept perfectly clean. It will not crack or split in using, and when on the walls stands like solid work. Ceilings may be finished to correspond with the walls, either in plain wood or in panels of any of the rare woods.

A correspondent of the *Manchester Guardian* asserts that an anonymous donor has determined to give £100,000 to promote technical education, and which will probably be apportioned to Owen's College, Birmingham and Glasgow.

It has been intimated to Sir John Musgrove, the president of St. Thomas's Hospital, that the Queen has consented to lay the first stone of the new building at Stangate. The ceremony will probably take place early in May.

The enlargement of the bathing lake at the east end of Victoria-park is nearly completed, and will form nearly twice its former dimensions in length. The average number of bathers during the season was upwards of 50,000.

The committee of the Corporation of London, charged with the care of the old burial ground at Bunhill-fields, have given notice to the relatives and friends of those who are interred there, to the effect that they are about to proceed at an early date with so much of the said act as directs that the said grounds shall be laid out with ornamental and other walks, in order to its being used and enjoyed as an open space accessible to the public. The committee before proceeding to lay out the walks invite all parties who may be interested to visit the burial-ground for the purpose of recognizing and identifying the graves, tombs, and vaults in which their relatives or friends may be interred. Persons desiring to visit the ground will be permitted to do so, free of charge, upon application to the keeper, between the hours of 9 a.m. and 6 p.m.

In reply to Mr. Samuelson, Lord R. Montagu said, on Tuesday night, that the report on technical education by secretaries of legations had been printed by the Foreign Office, and formed a thick octavo volume. Within two months the whole of the reports and appendices would be in the hands of members of the house.

No. 5, Devonshire-square, Bishopsgate-street, one of the old city mansions, containing about twenty spacious rooms, and a grand staircase of oak, was on Wednesday destroyed by fire.

We regret to learn the death of Mr. Ball Hughes, the sculptor, which took place at Boston, U.S., on the 5th instant, at the age of sixty-two. Mr. Hughes was born in London, and emigrated to America in 1829. He was a pupil of Baily for seven years, during which time he gained several important prizes in competition. The Royal Academy gave him a large silver medal for the best copy in bas-relief of Apollo. The Society of Arts awarded him a silver medal for a copy of the Barberini Faun, the large silver medal for the best original model from life, and a gold medal for an original composition, "Pandora brought to Earth by Mercury." Mr. Hughes executed a number of works both in this country and in the States, some of them of great excellence.

A correspondent writes to us—"Your remarks the other day, on the position and prospects of the Cobden statue at Camden Town, have evidently had some effect with the authorities of St. Pancras. The large and ungainly-looking hoarding, of which the bill-stickers have made such good or such bad use, has been removed, and a small neat paling now encloses the plinth of the monument, leaving the steps leading thereto and the lamp-posts open and unenclosed. The site of the monument has also been cleared of all the rubbish which disfigured and gave it the appearance of a ruin, or rather a thing never intended to be completed. Let us hope that the St. Pancras Board have now resolved to make an effort to have the statue of the great freetrader placed upon its pedestal without delay. I am not aware how the funds stand, but I am sure there are many of the inhabitants of Camden Town who, like myself, would willingly subscribe their mite if need be to assist in getting this desirable monument finished."

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

2130 J. HOOPER. Improvements in Ventilators Dated July 20, 1867.

The patentee claims constructing and arranging or combining the parts of a ventilator substantially as described and illustrated, whereby a series of flaps or doors covering a corresponding number of openings in the body of the ventilator may be simultaneously raised or simultaneously lowered, so as to open or close to the required degree the said openings in the ventilator.—Patent completed.

2131 B. P. FRANZONI. A New or Improved Method of Hardening Plaster, Plaster Castings, and the like. Dated July 22, 1867.

This invention consists in submitting plaster or materials or articles made of plaster, such as plaster castings, for the purpose of hardening, and, consequently, of rendering the same more durable, to a bath or solution of glue.—Patent abandoned.

2150 W. SIMPSON and W. HOWITT. Improvements in the Construction of the Roofs of Horticultural and other Buildings and Structures. Dated July 24, 1867.

The patentees claim constructing the principals of the roofs of horticultural and other buildings and structures hollow instead of solid, and of tubes or pipes and sockets, either separately or in combination with longitudinal pipes, rods, or bars, as described.—Patent completed.

2184 T. JONES. IMPROVEMENTS IN LOCKS AND LATCHES. Dated July 27, 1867.

This invention consists of the addition of the mechanism herinafter explained to locks and latches having spring bolts with bevelled ends, which mechanism has for its object to prevent the bolt of the lock or latch being forced back by pressure applied to its end. This invention, as applied to a spring latch having a barrel lock, is as follows:—Immediately over the bolt is a lever turning upon a pin in the latch case. This lever is pressed upon by a spring, that end of the spring which presses on the lever being of a V or convex shape, and bearing upon a projection on the lever immediately over the pin on which it turns. The projection is also of a V or convex shape. On the barrel of the lock is a projecting piece which, on turning the barrel, comes against a projection on the under side of the lever, and raises the long arm of the lever, or that end of the lever turned towards the bevelled end of the bolt. The lever remains in the raised position during the further motion of the barrel and the withdrawal of the bolt. After the opening of the door and the withdrawal of the key the lever retains its raised position until the closing of the door, when the forcing back of the bolt causes a shoulder on its inner end to strike against the tail of the lever, and depress the long arm of the lever, causing it to engage at the back of the head of the bolt, and to prevent the motion of the bolt inwards. The bolt cannot now be forced back by the insertion of a tool or instrument between the door and door frame. The introduction and turning of the key effects the raising of the lever and the liberation of the bolt in the manner before described. The lever is retained in one or other of the positions described by the V-shaped end of the spring pressing upon one or other side of the centre of the V-shaped projection over the axis of the lever. In order to enable a person inside the room to liberate the latch bolt without the use of the key, a small knob outside the latch case may be connected through a slot in the latch case with the lever. By means of this knob the lever may be raised and the bolt liberated.—Patent completed.

2158 C. H. MURRAY. IMPROVEMENTS IN MACHINERY FOR MOULDING CLAY FOR MAKING BRICKS, TILES, AND OTHER ANALOGOUS ARTICLES FROM PLASTIC SUBSTANCES. Dated July 25, 1867.

This invention consists in constructing the dies or apertures in brick-making machines, through which the plastic material is delivered, with movable hollow boxes or vessels, provided with perforated sides, and supplied with any suitable lubricant, which, by exuding through the perforations in the boxes, will lubricate the desired parts.—Patent completed.

2114 J. HARGREAVES, IMPROVEMENTS IN UTILIZING CERTAIN MATERIALS OR PRODUCTS OBTAINED DURING THE MANUFACTURES OF STEEL AND IRON. Dated July 19, 1867.

The patentee claims, first, the use of steel slag and steel cinder for the manufacture of glass by means substantially as described. Second, the use of steel slag for the manufacture of carbonates and hydrates of soda or potassa by means substantially as described.—Patent completed.

2125 W. TAYLOR. PIPES FOR VENTILATING, HEATING, AND VAPORIZING HOT-HOUSES, MALT-HOUSES, AND OTHER BUILDINGS AND RESIDENCES. Dated July 20, 1867.

The patentee claims, first, the application of chambers or passages to pipes for receiving hot water, &c., so that such chamber or passage may receive water or other liquid to be evaporated, whilst they at the same time act as conduit for the passage of air for ventilation, and thereby moisten as well as heat the air so supplied for ventilation, whereby hot-houses, malt-houses, and other buildings and residences, may be ventilated, heated, and vaporized, as described. Second, the method of forming the joints of pipes used in heating hot-houses, malt-houses, and other buildings and residences, as described.—Patent completed.

MEETINGS FOR THE ENSUING WEEK.

TUES.—Institution of Civil Engineers,—Continued discussion upon Mr. Sandberg's paper on "The Manufacture and Wear of Rails," 8.

WED.—Geological Society, 8

Society of Arts,—On "Horse as an Article of Food," by A. S. Bicknell, Esq.

FRI.—Architectural Association,—On "The Ruined Churches of Orkney and Shetland," by Sir H. E. L. Dryden, Bart.

Society of Arts,—Cantor Lectures, "Chlorine and its Compounds with Oxygen—Chlorate of Potash, its Manufacture and Remarkable Properties—Hydrochloric Acid, or Spirit of Salt, Its Production and Application in Arts and Manufactures, viz., Galvanizing of Iron, Sal Ammoniac, Chloride of Tin, &c.;" illustrations.

SAT.—Associated Arts Institute,—Exhibition of sketches, subjects, "The Old Farmhouse," and the "Siege of Corinth," Byron.

Trade News.

TENDERS.

The contract for the erection of the new high-level bridge from Newcastle to Gateshead has been let to Messrs. Panton, of Sunderland, for the water piers and iron work; and to Messrs. Walter Scott, of Newcastle, for approaches, &c. The estimated cost is about £35,000.

CHEPSTOW.—For additions and alterations of Chepstow Union:—

Stephens and Co.	£880 15 0
King and Godwin	685 0 0
T. and W. Jones	640 0 0
W. Roberts	535 0 0
J. Thorn (accepted)	480 0 0

BRIGHTON.—For workshops, Marlborough-place. Mr. J. Berney, architect:—

Oliver	£748 0 0
Loader	680 0 0
Dobson	600 11 0
Dallimore	587 0 0
George	569 0 0
Sawyer	540 0 0
Farr	516 0 0
Hall	473 0 0
Jackson	466 0 0
Lockyer	450 0 0

ENFIELD.—For additions to Bull's Cross National Schools, Enfield. Mr. Thomas J. Hill, architect:—

Rivett	£563
Bayes	520
Field and Sons	512
Patman, Brothers	508

EXETER.—For Congregational Church, Exeter. John Tarring, architect, 69, Basinghall-street, London, and Torquay, Devon. Quantities supplied:—

	General estimate.	Spire in Bath stone.
Such	£9836 19 0 ...	£3157 0 0

Hall	11445 0 0
Cheesman and Co.	10900 0 0
Chappell	10690 0 0
Perry, jun.	10444 0 0

SOUTH DEVON.—Restoration of Aveton Gifford Parish Church, South Devon. Mr. Henry Elliott, architect:—

Matcham	£3700
Stevenson and Crocker	3150
Call and Pethick	2644
Condy, Brothers	2440
W. C. Elliott	2397
J. Bone and Son	2380
Ruth and Son and C. Ruth jun.	2341
John Steer	2241
Hannaford and Luckraft	2170
John Wilcocks (accepted)	1997

SOUTHALL.—For Band-room and Training-kitchen at the St. Marylebone Schools, Southall. H. Saxon Snell, architect:—

Harding	£835 0 0
Till	817 0 0
Enstace	798 0 0
Keys	795 0 0
Manley and Rogers	790 0 0
Wardle and Baker	770 0 0
Gibson Brothers	745 0 0
Brown (accepted)	732 15 0

STOKE-ON-TRENT.—For the erection of new School Buildings for Zion Chapel (Methodist New Connexion). Messrs. R. Scrivener and Sons, architects, Hanley:—

Collis and Hudson	£475
Turner	448
Barlow (accepted)	435

SYDENHAM. — For Works, Wall's-road. Mr. Nicholas Lake, architect:—

Henshaw	£1430
King and Sons	1380
Wills	1284
Dubbin	1150

WIMBLEDON.—For new wing and stable buildings to Urmston-lodge, Wimbledon, for Frederick Thompson, Esq. Mr. J. H. Good, architect. Quantities supplied by Mr. L. C. Riddett:—

Nicholson	£2670
Burton and Morelaad	2626
Colls and Sons	2342
Aviss and Son	2316
Webb and Son	2300
Adamson and Son	2270

PROPERTY SALES.

MARCH 10.

AT THE MART.—By Messrs. Driver and Co.—Copyhold estate, situate in the parish of Peldon, Essex, and known as Pete Tye Farm, containing about 109a. 1r. 22p. of arable and grass lands, with farm house and buildings—sold for £3375.

By Messrs. Price and Clark.—Leasehold, five houses, Nos. 33 to 37, Warren street, Chapel street, Pentonville, producing £150 per annum, term 12¾ years unexpired, at £20 per annum—£710.

Leasehold two residences, Nos. 151 and 153, Lupus-street, Pimlico, producing £117 per annum, term 65½ years unexpired, at £19 per annum—£1,100.

Leasehold residence, No. 13, Ethingham-street, Pimlico, annual value £60, term 65½ years unexpired, at £9 per annum—£510.

Leasehold residence, No. 412, Old Kent road, annual value £75, term 59½ years unexpired, at £11 per annum—£840.

Leasehold five messuages (four with shops) No. 79, 81, 83, 85, and 87, Rodney-road, Walworth, producing £115 14s per annum, term 15¼ years unexpired, at £15 per annum—£490.

Leasehold, four messuages, Nos. 61, 63, 65, and 67, Chatham-street, Rodney-road, producing £87 2s. per annum, term 9¼ years unexpired, at £8 per annum—£240.

Leasehold, five houses, Nos. 55, Chatham-street, 9, Chatham-place, and 7 to 9, Little Chatham place, producing £77 6s. per annum, term 10 years unexpired, at £6 16s. per annum—£190.

MARCH 11.

AT THE MART.—By Messrs. Fuller, Horsey, Son, and Co.—Leasehold residence, known as Essex lodge, Upper Clapton, let at £160 per annum, term 70 years unexpired, at £20 per annum—£2350.

By Messrs. E. Fox and Bousfield.—Leasehold residence, with grounds, stabling, &c., known as Castle-hill-lodge, Upper Norwood, term 99 years from 1860, at £100 per annum—£4850.

Freehold house and shop, No. 153, Grove-street, Camden-town, let at £63 per annum—£1390.

Freehold residence, No. 157, Grove-street, Camden town, let at £44 per annum—£740.

Freehold residence, No. 156, Grove-street, Camden-town, let at £44 per annum—sold £720.

Freehold ground rents of £8 1s. per annum, secured on No. 154, Grove-street, Camden-town—£185.

MARCH 12.

AT THE MART.—By Messrs. Brown and Roberts.—Leasehold two residences, Nos. 9 and 10, Cleveland-terrace, Hyde-park, producing £230 5s. per annum, term 90 years from 1852, at £24 per annum—£3050.

Leasehold stable, No. 6, Porchester mews, Hyde-park, let at £35 15s. per annum, term 85½ years from 1853, at £2 per annum—£650.

Leasehold improved ground rent of £35 per annum, for about 71 years, secured upon houses, shops, and stabling in Leinster-street and Porchester-mews, Hyde-park—£630.

Leasehold profit rental of £60 7s. per annum, for about 30¾ years, arising from the "Rosemary Branch Tavern," and 25 houses at Peckham—£780.

Leasehold house, No. 19, Park place, Lower Park road, Peckham, let at £46 4s. per annum, term 65½ years from 1823, at £6 per annum—£270.

Leasehold residence, No. 413, Old Kent road, term 19 years unexpired, at £10 10s. per annum—£215.

By Messrs. C. C. and T. Moore.—Freehold ground rents of £50 per annum, arising from 14 houses in Levofre-road and Lefevre-terrace, Old Ford—£995.

Freehold, five houses, Nos 1, 2, and 3, Upper North-street, and 1A and 1, Evans street, East India-road, producing £92 11s. per annum—£1,125.

Freehold, two houses, Nos 53 and 54, Evans-street, Upper North-street, producing £39 18s. per annum—£530.

Freehold, four houses, Nos. 27 and 28, Northey-street, and 11 and 12, Oak-lane, Church-row, Limehouse, producing £72 16s per annum—£600.

Freehold, two houses, Nos. 98 and 100, Devonshire street, Globe-road, Mile-end, producing £42 per annum, and a freehold ground rent of £4 per annum, secured upon No. 96, Devonshire-street—£645.

MARCH 13.

AT THE MART.—By Mr. Frank Lewis.—Leasehold residence, No. 107, Adelaide-road, Haverstock-hill, annual value £100, term 77 years unexpired, at £15 15s. per annum—£1,145.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

James Gardner Anstin, Manor place, Walworth surveyor March 26, at 1.—A. G. Bowe, and Joseph Eccleston, Clarendon-street, Harrow, painters.—Robert Duff, Hugh-street West, Pimlico, builder, March 26, at 1.—Elijah Herbert, Mardon-road, Bermondsey, plasterer, April 1, at 11.—Frederick George Smyrk, Guildhall Chambers, asphalte contractor.—Thomas Barton, Upper Norwood, builder, April 17, at 1.—William Paul, Sandridge, Herts, builder, April 9, at 11.—Thomas Smith, Pickering-place, Bayswater, builder, April 6, at 11.

TO SURRENDER IN THE COUNTRY.

George Hunt, Bury St. Edmund's, plumber, March 28, at 11.—Christopher Gale, Whitby, builder, March 25, at 11.—John Hurton, Fiskerton, carpenter, March 26, at 11.—Thomas Dale Kirkham, Lower Broughton, near Manchester painter.—Edward Lindley, Bloxwich, contractor, March 26 at 12.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

April 17, T. Keen, Stratford, builder.—April 28, J. Pyne, Exeter, carpenter.—April 22, W. Smith, Hull, joiner.—April 2, U. H. Jones, Liverpool, builder.—April 14, J. Busby, Princes Risborough, plumber.—April 2, E. Rimington, Sheffield, joiners' tool manufacturer.—April 23, G. Knight, Albert-road, St. John's Wood, contractor

—April 17, J. Young, Goole, builder.—April 2, E. Cowin, Hulme, joiner.—April 21, A. Rogers, Trevethin, contractor.—April 17, A. Lever, Bolton, stonemason.—March 25, T. Skirr, Darlington, joiner.

DIVIDENDS.

March 26, R. Johnson and J. Addie, York-street, Lambeth, late merchants.—April 17, W. H. Patcheler, Leatherhead, builder.

PARTNERSHIPS DISSOLVED.

Benfield and Collins, St. Leonard's-on-Sea, builders.—Carr and Dodd, Newcastle-upon-Tyne, builders.—Cryer and Edmondson, Shipley, builders.—Davies and Beeston, Llanidloes, contractors for railway works.—Bass and Smith, Horninglow, near Burton-upon-Trent, timber merchants.

DECLARATIONS OF DIVIDENDS.

J. R. [illegible] Sunningdale, contractor, div. [illegible]

BANKRUPTCIES ANNULLED.

Thomas Francis, Leabridge, lime merchant, March 13.—William Cooper Wilson, Gray's Inn Chambers, builder, December 21.

THE BUILDING NEWS.

LONDON, FRIDAY, MARCH 27, 1868.

ST. PANCRAS' SCHOOLS, LEAVESDEN.

THE award of the premiums for this competition was made on the 19th of this month, the drawings having been for a few days exhibited in the Vestry Hall of St. Pancras' parish. The competing architects are eight in number, or rather seven, if we count Messrs. Giles and Biven, the successful competitors, as one. Their names are, respectively, Messrs. J. E. Knightley, 106, Cannon-street, City; F. Chambers, 15, Bow-lane, City; Messrs. Giles and Biven, Craven-street, Strand; Andrew Wilson; R. H. Burden, 507, Oxford-street; M. P. Manning, Mitre-court Chambers, Temple; and F. Peck, Furnival's-inn. Of the wisdom which prompted the authorities to select a site in the country for the education of the immense number of children which so large a parish cannot fail to throw upon their hands, there cannot be two opinions. An eligible piece of ground on the high road between Watford and St. Alban's has been chosen. It is about 1500ft. in length, and averages 700ft. in width, lying north and south, bounded on the south by the high road, and accessible on the north by other roads. To suit this condition of site all the competitors have placed the buildings on precisely the same spot, with the exception of the chapel. The main building is at the northern extremity of the ground, the infirmary midway on the western side, and the gas-house in the extreme south-western corner, the approach being in all cases from the main road. The instructions require that "every part of the building is to be of the plainest design," and "facilities for the escape of inmates in the event of fire."

The design of Messrs. Giles and Biven, which obtained the first premium of £150, is neither the best nor the worst. It contains the usual features with which we are perfectly well acquainted. A central portion in the long front to accommodate the administrative department, and to look pretty when visitors arrive; a central building, stretching back, to contain dining-hall, kitchen, &c., and communication with the other buildings in the rear; a wing for boys on the one side, and another for girls on the other, both sides to match; a tower, with a clock in it, over the visitors' entrance, and the thing is done. When the Princess Charlotte learned to draw in water colours, she was more distinguished for rapidity of execution than anything else. In the intervals between the lessons she was in the habit of making studies of considerable size, insomuch that her master was fain to have paper made expressly for her. On his next visit the drawing would be exhibited with much triumph, with the remark, "You see, Sir, it is done.' But how was it done? As we said, the premiated plan is neither the best nor the worst. Its merit is an extreme simplicity pushed to excess, and this simplicity is aggravated by an attempt to ornament the central portion. The execution of the drawings is thoroughly workmanlike. The interiors of the chapel, dining-hall, and school-room show a good and substantial style. Indeed, with the exception of the attempt at ornament in the central portion, this design has marvellously little of what is termed "humbug" in it. Owing to an unaccountable misconception of the requirements of the Poor Law Committee, 500 feet have been allowed to each bed, instead of 300 as actually required. At all events, merely cutting off the ends of the building, would make all right. This seems to us impossible. The building, therefore, is of greater length than required. The material is yellow brick with red bands. The provision for escape from fire seems inadequate. The playgrounds are enclosed in such a manner that they form a sort of quad. The noise would be appalling, to say nothing of the suggestion of exercise in a prison yard. The estimate was £30,000, and, if any of the designs can be carried out for the money, this one certainly can. The second premiated design, £100, is by Mr. Frederick Peck, of Furnival's-inn. It is by far the handsomest of the set, the style being fair domestic Tudor. The arrangement is superior to that of most of its rivals. The infants are kept quite apart on the north side, and there is a fire-escape stair, in the form of a small tower, to each of the dormitories, leading at once to the outer air. The chapel is about 200ft. from the main building, but situated at the west side. The execution of the designs is very good. The material is red brick with stone dressings. In this design ample provision, namely, seven staircases, is made for escape from fire. The estimate, £30,000, seems much too low, but Mr. Peck is confident, from his experience of similar works, that it would not be exceeded. It is no more ornamental than dozens of other charitable institutions in the neighbourhood of London. The Dramatic College, the Printers' Almshouses, and, for aught we know, the Charitable Grinders' Retreat, cost more, in proportion to size and accommodation, but the instructions regarding "plain design" are set at naught. The central clock tower might be pruned with advantage, and this is all we can say in the way of censure. Mr. Manning's design, which obtained the third prize of £50, has faults, but there is no doubt it is superior to that of Messrs. Giles and Biven. In our opinion the position of the chapel is not well chosen. It is thrown forward about 200ft. from the centre of the main building. The elevations are quite plain, in red brick. The outline is good, but we must protest against the two windows at the ends of the projecting wings. They are not only disfiguring, but absolutely needless. A void should always occupy the centre of a wall space, a pier never. Seven staircases for escape from fire are provided. The execution of the drawings is skilful, and, with the exception of the faults above-named, the building is admirably suited to its purpose. The estimate is £27,450. The instructions appear to be strictly adhered to. The design by Mr. Knightley contains a good plan. The elevations are of red brick, but the style is nondescript, and the building throughout inferior to those premiated. Mr. Chambers's plan is objectionable, two immense wings being thrown forward, the effect of which in perspective would be most unsatisfactory. This experiment, even in palaces, where cost is no object and where proportion can be obtained at will, is most hazardous, but, in a lofty three-storey building of extreme simplicity, it is altogether wrong. The infant department is not sufficiently separated from the rest. Yellow bricks with red bands form the material. The style is nondescript. Mr. Wilson's plan is not bad, but the attempt to vary the skyline has not been attended by fortunate results. The material is yellow and red brick, and the style, if any, is Victorian. Mr. R. Burden's design is next in merit to those obtaining the premiums. Considering its purpose, it is not inappropriate, though very plain. The playgrounds are enclosed. The material is yellow brick, with the slightest amount of red banding in the central and wing buildings. The style is not very pronounced, but is characterized by horizontality. With regard to the second and third designs, the committee have not judged amiss, but the first will scarcely find favour with the Poor Law Board, who will narrowly compare the designs with their own positive instructions. The ability to pass the Board is the crucial test, and we should not be surprised to see the Vestry compelled to reconsider its decision.

PAPERHANGINGS.

THE choice of a decorative covering for the interior walls of our dwellings is a matter of some importance, as we all know. A new invention, it appears, is attracting attention in the United States, and threatens, we are told, to supersede the use of common paperhangings. A machine has been constructed which will take a portion of a tree after it has been cut the right length and width, and shave it up into thin ribbons as wide as a roll of house paper, making one hundred, or one hundred and fifty, to the inch. These rolls are placed on the walls precisely in the same way as with pieces of paper. Certain advantages are claimed for the woodhangings, as we may call them, over the ordinary material. It is said, for instance, that the wood, which is wet when used, is found to work easier than paper; it can be oiled, varnished, or shellacked, and then washed at pleasure, and so kept perfectly clean; the wood will not crack or split in using, and when on the walls it stands like solid work; and, lastly, woods are of great variety, and admit of any amount of ornamentation. Granting the advantages, there are, on the other hand, certain disadvantages which, as it seems to us, would attend wood as compared with paper hangings. It might be questioned whether they could ever be made to look so light, varied, and cheerful as paper. Even a wall covered with the lighter kind of wood, or different varieties of wood, and done in panels, as is suggested might be done, would still have a certain sombre and heavy effect under whatever treatment, besides being expensive. Moreover, it might suit a hall, a library, or a dining-room, but would not be appropriate to a drawing-room or to bed-rooms. There would be little harmony or contrast of colour, and no relief to the eye. Again, the very solidity and durability of the work might be considered an objection. It would last too long. If paper fades soon, it is inexpensive, and can be easily renewed by the substitution of a fresh paper, giving fresh effect. It is one of the advantages of paperhangings that the commonest and cheapest are often the most agreeable or prettiest, while, from their infinite variety of pattern and design, every taste is consulted. A very large number of houses, in large towns especially, are always changing their tenants—houses of the middling and cheaper class more particularly—and a "fresh paper" is the usual complement of a new tenant. Many persons, it is well-known, find in migration a change really beneficial; they get relief from the various "ills that flesh is heir to" in a change of residence, with its new surroundings. Wall decoration plays an important part in this domestic account. A varnished or polished wood wall might be kept clean with little trouble truly, and it might, under certain conditions, be made to have a rich, warm look, but it would present nothing for the eye to rest upon, and we cannot see that it would possess any real advantages to render the adoption of woodhangings desirable, at least, for ordinary dwelling-houses. The idea seems more adapted to some public buildings—the interiors of public halls, for instance—though even here the usual methods of decoration are to be preferred on many accounts. For one thing, this new lining would render a building much more liable to fire, and would, of course, greatly facilitate it when a fire did happen. And the danger would only be increased were the walls oiled, varnished, or shellacked, as recommended. Sanitary reformers object to paperhangings—and, indeed, to all lath and plaster walls whatever—because of their absorbency of moisture and damp, and, in closely crowded habitations, of their absorbing of miasma. For which reasons they advocate walls of concrete construction, since these give a washable surface, and, therefore,

a more healthy dwelling, concrete having also the additional merit of being fireproof. What we should lose in appearance and taste, say they, we should gain in health, comfort, and safety. There is force in the argument, though there can be no doubt that paper-hangings, judiciously selected, are the most appropriate and agreeable covering for dwellings generally that ingenuity has yet devised. The manufacture of this elegant substitute for the ancient tapestry hangings of our forefathers, has undergone a gradual succession of improvements, and has now reached a high state of beauty and perfection. Of the three kinds of paper now in general use, the plainest and cheapest, which is usually composed of figures of one or more colours, is supposed to have been invented by M. Breitkopf, of Leipsic, who, at all events, brought it to great perfection. The invention of the velvet or flock paper is ascribed to an artist named Jerome Layner, in the reign of Charles I., about the year 1631; and that of satin or silver paper may be said to date from about the same period, the inventor, in this instance, being one John Hautsch, of Nuremberg. Paperhangings have increased in popularity ever since. The manufacture has undergone endless changes and improvements, as regards the designs and colours of the paper, but the principle of the manufacture has suffered little change. The invention of the paper machine, by which any length of paper may be obtained, effected a very great improvement in paperhangings, which could formerly only be printed upon separate sheets, and were much more inconvenient to print as well as to apply to the walls. Very much depends, as we have already said, on what sort of paper may be selected for a wall. Taste has of course a great deal to do with it, but not everything. Considerations of comfort, cleanliness, and convenience, ought certainly not to be overlooked. A paper should not only be pretty, handsome, or splendid, it ought to be suitable. Will it be useful as well as ornamental, is a question to be borne in mind in selecting most things, and, in the matter of choosing paperhangings, the question ought not to be forgotten. Rules for guidance in the selection of paper cannot be given, but it may be stated generally, as a safe piece of advice, that, as a rule, choice should not be made of green, on account of the arsenic which enters so largely into its manufacture. There is one kind of green paper made which is so very objectionable that it should be entirely prohibited from bed-rooms, and admitted very sparingly, if admitted at all, into any part of a house. Green ought to predominate in our furniture, but, though paper of this colour is often the most elegant to look at, it is not to be recommended as a hanging. Any other colour, in fact, is preferable.

MODERN GOTHIC FURNITURE.

NOT many years ago, the popular idea of Gothic furniture was aptly illustrated in Pugin's "True Principles." The plate, showing a collection of so-called Gothic furniture, is in satire little inferior to Hogarth's celebrated "Perspective." We may, however, congratulate ourselves on a marked improvement in furniture designs, and, if we have not attained excellence, we, at least, are earnest in the pursuit of it. Architects of eminence are found designing furniture, and manufacturers find it to their interest to pay for such designs, and, though the schools vary in their notions, the effort is decidedly upward.

Comparing the upholstery of twenty years ago with the furniture of the present day, we find matter for congratulation, and, if we even confine ourselves to what has been done within the last three or four years, it will be seen that, although there is much room for improvement, steady progress is being made. Where there used to be redundancy of ornament, we now see elaborate simplicity. Where formerly the construction was ingeniously concealed, it is now paraded with, perhaps, too much pomp. Where almost everything essayed to pass for what it was not, now things assert themselves most unmistakeably for what they are. At present the danger seems to be in this over-assertion, for, although it is one of those failings which lean to Virtue's side, it is a failing none the less, and, although protest against long-continued error is praiseworthy, it should not be urged with too much instance. When every joint seems to say, "See how close I am;" when every brass-headed nail proclaims its freedom from the humbug usually associated with brass-headed nails, we are apt to think that the piece of furniture "doth protest too much." This very earnestness is, however, a sign of vitality, needing only the correction which time and experience always administer. It must have been observed that the leading upholsterers have eagerly availed themselves of artistic talent, specimens of which have frequently found a place in our columns. Messrs. Burges, Butterfield, Street, Bevan, Talbert, and Jefferson are no ordinary designers of furniture, and, although they differ in their ideas of what furniture ought to be, they all produce designs of great merit. At the present moment, however, some excellent specimens of Gothic furniture are to be seen at the premises of Messrs. Gillow and Co., 176, Oxford-street, from the designs of Messrs. Bevan, Talbert, and Jefferson. Amongst other things a complete dining-room and bed-room suite of furniture is on exhibition, and a drawing-room suite is in course of manufacture. The sideboard, by Mr. Bevan, is, like the other articles of oak, solid and plain. The back is filled in with tiles manufactured expressly. The effect is very good. Variety is given by a sparing inlay of coloured woods, but there is no paint whatever. The dining table corresponds in style, and the chairs are simple, comfortable, and substantial, without being the least heavy. For carpets and curtains, the latter both in damask and muslin, Messrs. Gillow and Co. have obtained many beautiful designs, and no one can see them without being struck with the immense improvements which have taken place in Gothic design even within the last five or six years. If, however, we look back to what was done for the Exhibition of 1851, we have difficulty in persuading ourselves that the designers were not idiots, although we know very well that such was not the case. For the most part, they were "prosperous gentlemen," and had done nothing worse than commit the usual professional Pecksniffianisms, for which they compounded by paying the real author regularly, if not liberally. As a rule, they possessed much, and gave tithes in proportion. They took care of those of their household, and looked keenly after the interests of number one; but, with all this, they could not form any idea of what Gothic furniture should be.

The bed-room suite is complete even to the crockery. The soap-dish is not as other soap-dishes, the ewer is unique, and all is in perfect keeping with the style. The wardrobe, toilet table, bedstead, &c., are plain, but handsome, oak being used throughout; and, if the designs possess any faults, they certainly cannot be charged with redundancy of ornament or inconsistency in style. Besides these sets of furniture many articles of great elegance are to be seen; notably, an ebony cabinet, which was exhibited at Paris, and a drawing-room cabinet by Mr. Talbert. The latter is of large size, composed of walnut and other dark woods, relieved by satin and other light-coloured woods. There is marqueterie work in the panels, and the metal work, by Richardson and Slade, is of uncommonly good design and execution.

Some of the bed-room furniture in various woods, such as teak, ash, and even the humble birch and sycamore, is well worth notice. The teak is of excellent colour, and, exhibited in the form of a wardrobe, with a slight inlay of white and black wood, leaves little to be desired. Our own especial fancy is for the Venetian style of black, with a delicate inlay of white. By polishing some portions and leaving others dead the most beautiful effect can be produced. It can never be vulgar, can never be out of fashion, and when properly treated is not lugubrious in appearance. It has, in the eyes of the ladies, another merit—it suits the complexion. Without the black mantua or mantilla the Limenas or Sevillanas would scarcely be the fascinating creatures travellers report them to be, and we well know that a lady never looks better than when in widow's weeds. The modern process of producing black, or ebonized furniture, as it is called, is by soaking a soft wood, such as poplar or lime, in a strong dye. The black thus obtained is equal to ebony, with the advantage of being in pieces of almost any size, whereas it is well known that ebony can only be procured in small pieces, the expense of working which practically excludes it from the market. The Messrs. Gillow have recently applied machinery to the manufacture of furniture with great success. It unites economy with accuracy, and may be used, as we have seen, for fluting a column so small that an ordinary pencil cannot be laid in the flutes. The sawing, planing, and turning on a large scale are comprehensible enough, but the delicate operations for which an immense machine is made available are truly astonishing. With regard to the Gothic furniture to which we have referred, it should be stated that it is not made to order, but rather as an example, so that persons about to furnish a Gothic house may see what Gothic furniture is, and thus give their orders with their eyes open.

THEATRES.*

THE over-development of the balcony system in some of our modern theatres may be regarded as the firstborn of that subsidence of architectural forms which has been already noticed. It is about ten years since that Mr. T. H. Wyatt, the architect, or Mr. Webster, the manager—for no one knows the limits of responsibility in theatre building—imported the *balcon*, and adapted it with decided caution to the new arrangement of the Adelphi Theatre. Since then the unfortunate *balcon* has been twisted and pulled about in a most merciless manner, and finally applied to each tier or gallery in curves which are non-concentric. It is simply impossible to imagine anything more repulsive in a galleried circular interior, from whence all architectural form has been banished, than these excentric curves. We might have rested contentedly (it is the proper thing in these days to rest) with the banishment of all architectural features—we might have almost been thankful to get into a building that was free from all architecture—for we should then be sure of escaping even the chance of recognizing any of the coarse, false, and slavishly imitative work for which this second half of the nineteenth century is already so famous. Circular or semicircular galleries, one over the other, or in advance of one another, and with construction visible or simply whitewashed, so long as they were concentric and flat, would, I venture to say, be far more grateful, or rather less disagreeable, than the most elaborately "decorated" theatre designed on the *balcon* system, where curves and proportion and interior perspective are either neglected or not comprehended. But the evil of the system is not merely one of appearance, for it is very clear that, by projecting the lowest gallery in the form of a balcony, there must be such a difference between the levels of the pit floor at the high-

* Continued from page 178.

est, and the balcony floor at the lowest, in order to get headway and breathing space, that the best levels for seeing the stage must either be left in mid air, or one part of the auditory must be sacrificed to another. When, however, we come to the full extension of the pit, the case is entirely one of a few bad seats at the back of the pit *versus* the rest of the house. Will the rest of the house protest against this inconvenience? or, with characteristic British patience, will they calmly sit it out and suffer this or any other loss by which their pet, the manager, can add a few pounds to his income? At some of our theatres the dress circle, as we yet know it at the Haymarket, has no existence. At the Olympic, for example, there is no dress circle—what is called and charged as "dress circle" is really the upper circle, for its lowest floor level is more than 9ft. above the stage. The same may be said of the Princess's, the Queen's, and indeed of every theatre where the pit extends beneath the dress circle; the only difference is that of about 2ft. more or less, the less to the sacrifice of the pit the more to the further sacrifice of the rest of the house. What is really wanted is the total abolition of the pit as the place of the groundlings; its retention to the present day is only another instance of the way in which everything theatrical is choked by prejudice, and the what-has-been-must-be theory. No one probably will hesitate to admit that the pit seats in the old Haymarket house are second to none as regards position. This is evident enough now, but it would be still more palpable if Mr. Buckstone could be bold enough to give up his pet footlights. It requires neither argument nor example to show that the pit or area of the house is by far the best place in the house. To a certain extent this has been recognized by dividing the front portion of the pit from the back, and letting the front seats, or stalls, as they are called, at a price considerably higher than other seats in the house. Let it be fully recognized, and the frequenters of the pit would soon settle into other portions of the house, the dress circle would resume its old position as to level, there need be no objectionable tunnelings under the dress circle, we might start with an architectural base, we should secure consistency by letting the best places at the best prices, we should add to the comfort of every one in all parts of the house from the gallery to the stalls, we should, we believe, add to the pocket of the manager (chiefest of considerations), and we should receive the thanks of the great majority of playgoers, if we had but the small modicum of courage necessary to withstand the grumbling of that most conventional of play-goers—the frequenter of the pit.

Another evil which we are threatened with is the undue publicity of private boxes. If we pay for a "private box," we expect a box that shall be private, and not to find ourselves the possessors of four seats (two useless) framed off with a great show of curtains that won't run, and partitions that don't part. Of course the private boxes—and, indeed, all the arrangements—of such theatres as the New Royalty or the Prince of Wales's are beyond criticism. There are, however, certain theatres, of which those just mentioned are two prominent examples, that are disgraces as public buildings to everyone concerned, from the Lord Chamberlain downwards. The only wonder is that they have not been burnt down long ago, or that any company could be induced to effect an insurance on them. Narrow passages, narrow and tortuous exits, wood everywhere, gas everywhere, and, indeed, these two last in such close proximity that in some places the wood partitions are too hot to touch—it is, I repeat, matter for wonder that the Lord Chamberlain should ever have licensed them, or that he should continue to countenance such incommodious and dangerous structures.* E. W. Godwin.

* To be continued.

FURNITURE AND INTERIOR DECORATION.*

THAT kind of domestic embellishment called decoration is generally believed to be a costly luxury. It may be rendered very expensive according to the manner of its execution, but, as its essential beauty consists of design and harmony, these need not of necessity be extravagantly asserted. It may be supposed that the last great precepts in decoration were pronounced at the late Universal Exhibition. All the elements of the beautiful were there certainly, but there was no fitting illustration of their effect in combination, and this was one of the greatest wants felt by those who went as students to the Champ de Mars. It should have been the care of the Government to have shown, in composition, the ornamental resources of French manufacture. As it was, visitors were bewildered by the multiplicity of splendid fragments, the effect of which, in application, they could not possibly conceive. The quality of these bespoke the highest executive accomplishment, but their utmost excellence did not appear, because there was no means of seeing those beautiful parts associated in effective unison. A faculty for the production of fragmentary designs is not necessarily a power equal to the accomplishment of a harmonious combination. Merit in detail is lost in faulty composition, but judicious arrangement gives value to even indifferent material. These observations and other remarks that follow are suggested by a perusal of a brochure on decoration, by M. E. Guichard, of Paris, who deals with his subject as a fine art. His style is somewhat flippant, and his illustrations by no means happy, when he departs from the direct line of precept, and, although much that he brings forward may not be intelligible even to his own countrymen, yet his propositions may lead some to address themselves less conventionally to a study susceptible of a very high degree of refinement. The rule with our neighbours as to drawing-room decoration is white and gold. With this they profess that they can never go wrong, of what kind of colour soever may be the draperies and cabinet work in the room. The details are sometimes exquisite, but the general effect, as being left to chance, is more frequently than otherwise extremely offensive. The discrepancies of the *salle à manger* are thus described by the writer:—"Let us enter," he says, "the dining-room—the dining-room of the nineteenth century. Here, by a happy chance, there are two rooms, one for ordinary occasions, and the other for gala days. In the former the draperies are of woollen reps, and the panels are embossed paper. On whatnots and other convenient articles of furniture are set forth miniature cups and dolls' toys. But what is become of you, oh! beautiful ornamental dishes of bygone days? and why are you not present, *chefs d'œuvres* of our modern porcelain? A chandelier hangs immediately over the table. Either change this chandelier for a smaller, or let the ceiling be made to harmonize with it. The former alternative is the simplest, the latter the more costly. . . . . But what is this odour that assails the nostrils? . . . . . The reps furniture and embossed paper indiscreetly proclaim the substance of yesterday's dinner. These materials are, indeed, very tenacious of the perfumes of recent banquets."

In adverting to the bad taste prevalent in the fitting up of what is called a *salle à manger d'apparat*—that is, a banquetting-room of the first class—the writer says that even in such instances the wealthy proprietor is entirely in the hands of ignorant and unscrupulous adventurers. The draperies are heavy. The table, the chairs, the sideboards—all the moveables, indeed—are of black wood; and, to complete the funereal aspect of the place, nothing but the black plumes are wanting. M. Guichard would replace this by furniture of oak, or some other wood of warm tint, and decidedly condemns chairs on which are carved the entire coat of arms of the host, much to the discomfort of the guest at table. We are then invited to consider the modern French drawing-room, which is a mere monotony of white paint and gilding. The description will apply to any number of first-class saloons. The doors, the panels, the wainscots, the ceilings, the cornices, the arabesques, and compositions in relief, are the universal white and gilt; but the stereotyped pattern is easy of execution, for, white being the negation of colour, it is not necessary to seek effective contrasts and harmonies. With the absolute condemnation of high-toned decoration, without reference to the amount of light in the apartment, we cannot agree, for in France, as well as in England, there is a very great proportion of drawing-rooms for which this kind of decoration is alone suitable.

In order to correct this state of things the remedy proposed is one which would require a course of study too prolonged and close to be generally followed, but it is, nevertheless, the basis of all that is excellent in decoration—it is, in short, the study of Nature, which we would simply interpret as pictorial effect, breadth, and harmony. As a model, a landscape is chosen in which the near objects—trees, herbage, flowers—are present with all their importunate details, while in the distance all definition is lost in the blending of the whole as it recedes from the foreground. This affords us the perspective of colour for daylight; for evening or night another description is given. The application of the precepts gathered from the lesson—say for daylight effect—is as follows:—Let your carpet be bright and rich in colour towards the centre, whence, both in tone and hue, it should gradually decline to the extremities. The seats of the chairs must be bright in tint, but for the fabric with which the backs are covered the colour should be somewhat lowered, and the wall or panelling should yet more be reduced in tone (and different in colour if desirable), and the tables should be as light in tint as possible. If this be judiciously carried out the effect will not only be strikingly brilliant, but it will very much increase in appearance the size of the room. A landscape is a wide field to propose as a model for the embellishments of a drawing-room, but, after all, it is from Nature that every touch of the beautiful proceeds.

Of the conventional drawing-room M. Guichard says that its garniture presents nothing but violent contrasts, shown by deep red sofas and arm-chairs relieved by white and gold. The lady of the house perhaps places herself in one of these seats, which has the effect of suddenly changing her complexion to a livid hue; and this is not the least objectionable result attendant on the false apposition of colour. According to the principles here laid down, and taking the complexion of a family, or an individual, whether dark or fair, as the keynote of the entire symphony, the decorations of a room might be so divided as to set it forth to the greatest advantage.

It is unnecessary to accompany the writer through the details which he prescribes as indispensable to the perfection of his scheme of decoration. Many of his propositions are open to objection. It cannot be denied that there is room for every improvement in decoration. Even in middle-class houses the exercise of taste is less costly than vulgar parade. The difficulties of a successful result do not readily show themselves to the observer; nevertheless, the embarrassments may have been many, but they have all yielded to well-directed study of colour and composition. "Proceed," says the writer, "from analysis to synthesis; and, above all, remember that the sixteenth, seventeenth, and eighteenth centuries are already far behind us. Times

* De la Meublement et de la Decoration Interieure des nos Appartements. Par M. E. Guichard, architecte-decorateur. Paris.

fortunes, and manners have changed. Study them as they exist, and adapt your art to the exigencies of the time. The charm of art is in nowise weakened because it has tempered itself to the Greece of Pericles, to the Rome of Agrippa, to the Italy of Leo X., to the France of Francis I. and Louis XIV. Methods, or 'styles' so called, of embellishment are exhaustless, and those which are now historical have been appropriate to the times of their prevalence respectively. It may, therefore, be reasonably asked, why a distinctive character is wanting to the ornamental art of a period which, in all else, surpasses the utmost cunning of all historical time!"

ORGANS.

"De gustibus non est disputandum." Upon musical questions this is even more true than in the sister arts. Still there are in these matters some data to go upon. It is at least very questionable how far the opinion of foreigners upon the art of Englishmen is of much value. The Paris Exhibitions have shown pretty plainly that in some branches of art the French at any rate entirely misunderstand us, and fail completely to appreciate any of the excellencies of our best work. It is even denied that we can paint landscape. Turner himself is scarcely esteemed of any value. I am not a whit more prepared to accept the verdict of foreigners upon musical sound than I should upon poetry or painting, certainly not when the quality of sound produced abroad happens to be different from what we produce. The fashion of Englishmen to disparage their own countrymen, not only of the present day but of all others, has done endless damage in a hundred ways. The gilt bronze royal effigies at Westminster are of great beauty and merit, so, contrary to the most direct evidence, "they must have been done by an Italian." The portrait of Richard II., over the scrubbing of which there has been so much congratulation, is so delicately drawn that it also "appears to be Italian." In consequence, the curious diaper for the background, so distinctive of English work, was destroyed, and with it the English character of the painting. If the tone of an organ is really so much a matter of taste as your correspondent affirms, it is rather amusing to find him dogmatising about it as he does, and in his former letter connecting it with a material that has nothing on earth to do with it. I need scarcely point out to any of your readers but Mr. W. Taylor, that, though an English verdict upon the question of music may be of far lower value than a German one—a position, by the way, which I entirely deny, and which is contradicted by facts—there is no more critical audience than an English one, nor can you have music better rendered in any country than in our own. I would also say, with the late Mr. Edward Taylor, that, in all branches of music where fashion has allowed fair play to the artist, England has never been a whit behind the foreigner, no matter of what nation. In some things, as in the glee and anthem, we have never been equalled. Still, even supposing that an English verdict upon music is not of the same value as a German one, it by no means follows that the German verdict upon organs is of the same superior importance. It is rather curious to observe how much it is the fashion of Englishmen to preach up foreigners at the expense of their own countrymen. In the last century and the beginning of this Italy was everything in music. I remember seeing in an old number of the Lady's Magazine a passage where it said you might as well expect some impossible thing, I forget exactly what, to happen, as to hope for musical taste in a German. Mozart and Mendelssohn have altered that opinion—possibly it may be France that will in our children's time be held up to the worship of Englishmen in this matter. I have not much acquaintance with the German organs; but I have most minutely examined, by the courtesy of Mr. Rogers, the Doncaster organ, which is acknowledged to be a particularly fine specimen of Schulze's work, and immediately afterwards that great work at Liverpool, which, by the way, has lately been wonderfully increased in power and beauty, and I can affirm that the Liverpool organ is in every respect entirely superior to that at Doncaster, which, with much that is beautiful, is still old-fashioned and almost retrograde. There are evidences throughout the work of indecision and rule of thumb work that would be perfectly amusing to such a man as Henry Willis. Talk about windage, why this much-vaunted instrument has the same antiquated apparatus which in this country has been superseded for a century or more, bearing about the same comparison to what our best builders do as the old state carriage and eight would do to an express train on the Great Western. While upon this subject, I will only remark that, whatever difficulty the present organ-blower (an old man I believe) may find with the Kingston organ, that, at its inauguration, two of Mr. Willis's boys blew it, though it is a very large organ, with pneumatic levers and sub and super octave couplers. I need not say that on that occasion the full organ was used, not for a chord or two, but at the pleasure of the accomplished organist, Mr. Hopkins, who opened the instrument. I will only add that, whether we take the gambas, flutes (harmonic), diapasons, or reeds, this organ can scarcely be surpassed. Singularly enough, too, the whole of the metal of this organ is spotted. One is almost tempted to ask Mr. Taylor whether he knows what spotted metal means? He tells us that the metal of Father Smith's pipes in the St. Paul's organ are much better than ordinary spotted metal. If so, why have they not spotted? The fact is that they contained, and contain, for they have not been recast or altered in quality, only one quarter of tin, and, therefore, the metal does not reach a spot. So much for your correspondent's assertion as to the practice of the "artists of all ages." I suppose Mr. Taylor is not aware that Mr. Willis completely rebuilt this organ about three years ago. So far as any locking-up of pipes was concerned, it is only true so far as that the *cathedral doors were shut at night*. Any further locking-up is a mere myth. The Dean and Chapter, when they employed Mr. Willis, had doubtless the fullest confidence both in his abilities and his honesty, nor, as far as I can learn, were they at all disappointed in either. In my opinion of the excellency of the Kingston organ, I am fully borne out by the unequivocal expressions of admiration of Mr. Hopkins, who opened it, and of Mr. Turle, who was present at its inauguration. Winchester organ is notoriously one of the finest cathedral organs in the kingdom. I have never heard this impugned.

Mr. Taylor does not, perhaps, know that the builder whom I casually mentioned as among those most famous in England, is now constructing the great organ for the Royal Albert Hall of Arts and Sciences, with, among other things, 32ft. metal pipes, the diapasons to be of pure tin. He is also doing one for the Alexandra Palace at Muswell Hill, which we shall all have an opportunity, in a very few weeks, of hearing and inspecting. They will both, I am told, have some extraordinary mechanical improvements. It will in my opinion be wiser in Mr. Taylor to suspend his judgment till these are before the public. It will give your readers some idea of the importance of these instruments, when I tell you that the least of them will contain more than 100 stops! In the face of such gigantic affairs as these, with mechanical appliances as simple, beautiful, and astonishing as any of our steam machinery, all either original or at least original in their application and extension, it can only raise a smile when we are told that, after all, Lewes "is your man."

I do not for a moment mean to imply that Mr. Lewes may not be a rising man, or that organ building may not be more his *forte* than architecture, to which I believe he devoted his younger years. What I object to, as positively ridiculous, is thrusting him forward as *the* English organ builder, when, as far as we know, he has never built a really large organ at all. That this is the case is proved by an advertisement of his which occurred lately in the *Musical Standard*. *In this he offers to build a large organ for some townhall or public building, at prime cost!* It would, therefore, seem more agreeable to fair play and common sense to wait till he has constructed a first-rate instrument before we adjudicate upon his abilities. Loving music and all connected with it as I do, I should be the last person in the world to disparage a really rising man. If Mr. Lewes should show himself to be the rival of Willis, Schulze, and Cavaillé-Coll, no one will be more happy to acknowledge it and welcome the acquisition to the musical world than myself. At present I am not aware that he is known, except as a builder of small country church organs, and not always a successful one. Mr. Schulze may or may not laugh at Mr. Willis's flue work. I have personally known first-rate painters of the present day laugh at Van Dyck and the old masters. This, however, I know, from a very careful comparison of the two, that, whether he may laugh or no, he cannot come near the tone of Willis. His Doncaster organ is simply a fine specimen of the organs of 150 years ago. Willis's is as much superior to that, as are Erard's or Broadwood's grand pianos to the old harpsichord. That Cavaillé would do no such thing, I happen to know for certain. He is particularly intimate with Mr. Willis, and they mutually esteem each other's great talents. M. Cavaillé has frequently been heard to say that, if anyone wants to study the new improvements in organ building, he must come to England, and he has, in fact, frequently sent his friends to Mr. Willis and others to see their works. The fact is, that Germany, Belgium, and France have had to copy English mechanism, as I find in a work, a few years old, published on the Continent, the contrivances that were really developed in England by Hill and Willis in 1851. Notwithstanding your correspondent's opinion to the contrary, there is not a question that architecture has made rapid strides of late years, though still there is far too much mere copying—too much fear of getting out of the beaten track of precedent. Fortunately organ building has been able to forsake the old routine, and strike out a new and original scope for itself. A man like Mr. Willis has not now to ask himself whether his tone is like that of the Haarlem organ. He makes up his mind what tone he wants to get, and goes straight forward to get it, and usually succeeds in a marvellous manner. Of course there are many who will lift up their eyes and say that his tones are not a bit like their old favourites, which is likely enough; but the time will come, if it has not come already, when the soft emasculated tones of the old-fashioned organ will be no more desiderated than the pleasant tinkle of the spinnet or harpsichord. Of this I am quite sure, that England has nothing to fear from foreign organ builders, except so far as she is so often and so fatally influenced by fashion, without taking the trouble to examine for herself. We are naturally a musical nation—a very musical nation; in critical power second to no other. It will be a great pity if we allow ourselves to be talked into a neglect of our national organ builders, and thus stop the progress of an art which, under the hands of such a man as the builder of the Liverpool, Albert Memorial, and Alexandra Palace organs, seems likely even still to develop in a manner that will astonish us all.

J. C. J.

DECORATIONS OF THE NEW FOREIGN OFFICE.

On Wednesday evening last, Mr. Disraeli held a brilliant reception in the grand saloon of the new Foreign Office. "The building," says the *Daily News*, "has only been out of the hands of the contractor since last Thursday, and great exertions have been necessary to make it ready for last night's reception. The entrance was from the Downing-street gateway, the visitors alighting on the right-hand side and passing into the lower corridor, which runs from east to west the length of that wing of the building. The walls of this corridor are panelled in vellum and tint and amber, with dado of green. For the occasion the openings in the walls were covered with crimson cloth, and a plentiful supply of exotics formed an agreeable avenue for the visitors to pass through. The grand staircase is situate at the centre of the lower corridor, on the left-hand side. It starts from the centre, working up right and left on to the corridor on the principal storey. The basement pillars of the hand rail of the staircase are made of fine Devonshire marble, highly polished, the hand rail is of dove-colonred marble, the balusters of fine alabaster, and the strings and courses of black marble. The lower stage walls are of amber colour, charged with honeysuckle pattern in gold and black. The dividing panels are of black, with arabesques of tridents and dolphins, with the royal initials in gold; the royal arms emblazoned in full colour and gold forming centre features. The upper stage walls are of soft toned green powdered, with ornament in white, black, and gold, dado of deep green panelled with black lines, with fret in black and yellow for borders. The various marbles used in the lower staging are Irish green, Devonshire, Dove, Sienna, Princes red, and black,

enriched with gold mouldings. This staircase is lighted during the day from the south by seven windows, and at night by two corona gas chandeliers suspended from the ceiling on either side of the domed centre. The roof of the staircase is deeply coffered—the panels contain ornaments in bold relief, treated richly with gold, the mouldings being of green, of pale greyish hue. The central portion of the roof will display a rather flat cupola with pendentives, the latter to bear figures of the quarters of the earth, the former a series of figures representing various nations, arranged beneath a zodiacal circle, and a vault of pale blue powdered with stars. The corridor on the principal storey is supported by columns of British granite, over the capitals being a decoration of frieze. In the principal corridor the columns are of Devonshire marble, surmounted by a decorated frieze, the ceiling being of pale blue, charged with ornaments in gold. The grand corridor is divided into seven arches, each arch on either side being ornamented with most elaborate designs in stone work, in the nature of arabesque, comprising scroll work interlaced with flowers, fruit, animals, &c., in pleasing variety, and of great beauty of workmanship. The rooms on both sides of the grand corridor were used last evening as refreshment and retiring rooms. The grand centre to which the company converged was the Secretary of State's saloon. This magnificent room is lighted by five windows, three looking out upon the enclosure in St. James's-park, and the other two in the direction of the Duke of York's column. A magnificent chandelier, suspended from the centre of the ceiling, supplemented by small candelabra fixed round the walls of the room, most effectively lit the room last evening. Of the apartment itself it is only necessary to say that the walls are prepared in sage green bordered with black. The field is powdered with ornaments in gold and black, and the border enriched with an intricate arabesque in gold. The ceiling of the room is coffered in octagons, geometrically arranged, decorated in pale green and gold, the girders being panelled with ornament in porcelain, white in relief on amber tint. The general effect was most agreeable. The principal saloons were most brilliantly illuminated under the superintendence of Hancock and Rixon. At ten o'clock the visitors began to assemble, and comprised the elite of society at present in town, as well as several members of the Royal Family."

PARLIAMENTARY NOTES.

In the House of Commons on Friday, Mr. Schreiber asked the Vice-President of the Committee of Council on Education whether his attention had been called to recent discoveries on the site (hitherto lost) of the manufactory of old English porcelain at Bow, as announced in the Building News last week. The honourable member expressed a desire to know whether Lord Montagu would enter into communication with Messrs. Bell and Black, with a view to the further prosecution on their property at Bow of discoveries so important and interesting in the history of English art. Lord R. Montagu said it was true that interesting specimens of old English china had been discovered at Bow, and that some specimens had been sent to the Museum of Practical Geology, where they had been identified as of the same kind as specimens before existing, but of hitherto unknown manufacture. Messrs. Bell and Black have offered to reopen the diggings, if it was thought that it would be of any advantage to the study of the history of English ceramic art.

TECHNICAL EDUCATION.

On Tuesday evening last Mr. Samuelson moved for a Select Committee to inquire into the provisions for giving instruction in theoretical and applied science to the industrial classes. In an interesting speech he canvassed the working of the schools under the Science and Art Department, showing that the results were unsatisfactory, and that a great improvement in scientific education was necessary for the development of our manufacturing prosperity; and he held out a strong hope that it would, at the same time, promote the literary and general education of the working classes. The motion was seconded by Mr. Dixon and supported by Mr. Baines, who held that a strong case for inquiry had been made out, but preferred that it should be by a Royal Commission. Mr. Bazley was inclined to trust for our manufacturing progress to the inventive genius, enterprize, and self-education of our manufacturers, rather than to technical education, and exhorted them to put their own shoulders to the wheel, instead of appealing to the State for help. The duty of the State, he insisted, was to give a good primary education, and with that we need not despair that the English workman would keep pace with the world. He denied that we were retrograding in any branch of manufactures, and he deprecated the interference of the State in the education of the workshop. Mr. E. Potter took entirely the same view as Mr. Bazley, and denied that it was the duty of the Government to supply a kind of education which the manufacturers themselves had done so little to promote; and Mr. Bagnall argued that technical education was more needed for the class of managers and overlookers than for the working men. Lord R. Montagu held it to be proved beyond doubt that in many branches our manufacturers were being closely pressed by foreign competition, though this did not arise so much from the deterioration of our processes as from the improvement and increase of Continental manufactures, and the completion of the foreign system of railways. He mentioned numerous cases within his own knowledge in which foreign manufacturers had successfully competed with us even in our own markets, and the cause he held to be that though we had iron, coal, cheap transit, intelligent, industrious, and tasteful workmen, we wanted technical education. After an elaborate discussion of the meaning and objects of technical education, he laid it down that the duty of the State did not go beyond giving the workman such knowledge of the natural laws applicable to his calling as would enable him to exercise it with the greatest effect. The State had to do with the brain, the workshop must perfect the hands. He traced the improvements effected in many branches of our manufactures by the educational movement which was the result of the Exhibition of 1851, and he argued that the chief things to be avoided were the establishment of special schools and of State manufactures for the encouragement of trade. The recent Minute of Council for the creation of industrial schools, he explained, had been very successful, and he concluded by acceding to the motion for a Committee. Mr. H. A. Bruce dwelt on the importance of elementary education, and Mr. Henley defended the working-classes from the imputations of ignorance recently made against them, the motive of which, he hinted, was not altogether disinterested, inasmuch as he had noticed in the reports that these highly-educated foreign workmen invariably worked longer hours and for less money. He ridiculed the suggestion that a trade could be taught in school; the workshop was the only training-school. The Committee was agreed to, after some observations from Mr. Paget and Mr. Acland.

THE THAMES EMBANKMENT.

The *Times*, in an article on this subject, says, "The public will rejoice to hear that they have really a prospect of soon enjoying some of the benefits they have long promised themselves from the Thames Embankment. We have reason to believe that the whole of the completed part of the Embankment will be forthwith prepared for public traffic. It is not easy to estimate the boon which will thus be conferred upon the busy portion of the metropolis. The two chief centres of life in London are now the City and Westminster, and the transaction of business—which means the maintenance of the activity of the Empire—depends on the communication between those two centres. At present they are united by an indirect, a tortuous, an obstructed, and a narrow lane, which it is a mockery to call a thoroughfare. If the streets of a city may be compared to the veins of a complex animal, the Strand constitutes a kind of aneurism in the most vital part of the body. It would, indeed, have been an inexcusable waste if the fine space of ground already reclaimed from the mud and refuse of the river had been allowed to remain unoccupied merely because there was more to be added to it. 'Half a loaf is better than no bread,' and the portion of the Embankment already constructed is considerably more than half. Let us, for a moment, consider more precisely what will be gained. The lawyers, in the first place, and the great hive of Parliamentary as well as legal industry which is concentrated in the Inns of Court, will be placed in direct and easy communication with the Houses of Parliament and the chief Courts of Law. A glance at the map will show that, even apart from the crowded state of the Strand, this is a great gain. Charing-cross is the centre of an arc, of which Temple-bar and the Houses of Parliament are the two extremities, and of which the river or the Embankment is the string. We shall, in fact, go straight across the arc instead of going all round it, and when we add to this that we escape the delays of the Strand, it is probable that more than half the time now consumed between the two places will be saved."

The same paper suggests that the roadway, or at least the footway, of the Embankment should, for the present, be admitted into King's Bench-walk, in the Temple, and thus be placed in communication with the street leading thence to Blackfriars-bridge. For foot passengers we can see no reasonable objection to this arrangement. If the Templars should object to any part of their precincts being disturbed by carriage traffic, they may remember that they themselves will be at first more benefited than any one else by the improvement, and might, therefore, gracefully consent to make some temporary sacrifice. But the great and obvious advantage of such a plan would probably be sufficient to insure its adoption, if the construction of the Embankment renders it feasible. To discharge the traffic of the Embankment into Fleet-street solely by the narrow streets west of the Temple must, in some degree, occasion the same inconvenience as is experienced at the junction of Park-lane and Piccadilly. If any portion of it could find its way into Bridge-street, so as to unite with the main stream where that broad thoroughfare crosses Fleet-street and Ludgate-hill, we should probably escape all confusion, more especially as the Corporation have already commenced the works which are to widen the bottom of Ludgate-hill.

BUILDING AND LAND SOCIETIES.

The United Building Society, Birmingham, held its eleventh annual meeting last week. From the report it appears that the receipts for the past financial year had been £14,293 15s. 7d., forming in the aggregate nearly £153,000. The profits, inclusive of the reserve and deferred premium fund, amounted to £1,657 1s. 2d. The directors request the auditors to add 5 per cent. compound interest to the credit of all the members. This would leave a balance of £812 15s. 10d. in favour of the society. The report further announces that Mr. George Dixon, M.P., had accepted the office of president of the society, in the room of Mr. Wm. Scholefield, M.P., deceased.

The eleventh annual meeting of the Exeter Freehold Land Society was held last week to receive the report of the directors. The society has to be congratulated on the satisfactory progress it has made. The report shows extremely favourable results. We find that the number of members at the end of the year was 724, holding 1,096 shares, an increase of 118 members and 224 shares. The total of the receipts in the year amounted to the large sum of £8,050 7s. 6d., and the profits realized amounted to £1,110 4s. 5d. This enabled the committee to pay a dividend of 7 per cent. per annum, to carry £100 to the reserve fund, and a balance of £100 to the credit of the ensuing year's account. Since the establishment of the society there has been 429 allotments purchased, at a cost of £20,000, and above 100 houses have been built upon them, at a cost of £30,000.

Though the past year was one of great commercial depression, the directors of the Halifax Permanent Benefit Building Society, in their fifteenth annual report just issued, congratulate the shareholders on the continued progress of the society, as compared with former years. The total receipts for the year was £113,396, being an increase of £19,976 on the last year. As many as 2,045 shares had been taken up by 741 new members, or 73 shares more than the previous year. The withdrawals paid to members had been £15,365, less by £6,031 than last year. In the deposit department there had been invested £43,074, an increase upon the former year of 103 depositors and £11,498. The withdrawals amounted to £22,830, £5,727 more than last year. The sum lent upon mortgage during the year had been £50,397, being £8,918 more than the previous year. This being the bonus year, the directors recommend that £290 should be carried to the reserve fund, and the remainder appropriated for bonus among the members.

NEW TOWNHALL, ABERDEEN.

WE give this week an illustration of the new townhall about to be erected in Aberdeen, at a cost, including the site, of about £60,000. The building is in the Gothic style, but strongly impressed with the well-known characteristics of the old Scottish architecture. The most striking feature is the tower, which rises without a break to the height of 72ft., and is 28ft. square. The great hall on the first floor is 76ft. by 46ft. by 48ft., and the edifice will have a frontage in Union-street of 200ft., and in Broad-street of 115ft. It will be built of granite, and will, probably, be the most picturesque building yet attempted in that hard material.

LIVERPOOL ARCHITECTURAL SOCIETY.

SEVERAL topics of interest were brought forward at the meeting of this society held last week. Mr. Kilpin, the president, made some remarks with reference to the local building bye-laws. At a previous meeting it had been determined to present a memorial to the town council praying for a revision of the local building act and bye-laws, but the chairman explained that it had not been yet sent. With respect to the building act, Mr. Kilpin said that the absurdities were so flagrant as to require immediate consideration and, if possible, an effectual remedy. Mr. Shoolbred said he had put up a roof covered with zinc in Liverpool, and the amount of timber he had been obliged by the building act to put into it amounted to 450 per cent. compared with what would be required in London or elsewhere, and it added 160 per cent. to the cost of the framing of the roof. This additional amount of timber in no way conduced to the strength or stability of the roof, but, on the contrary, weakened it considerably by adding an amount of dead weight the supporting frame was not calculated to bear. Mr. R. Jahns exhibited a new surveying instrument, of which he is the inventor, called the auto-planograph, the object of which is to dispense with the necessity for measurement with the chain in surveying operations. This instrument, according to the inventor, enables everybody who is able to read to take a very exact land survey of any kind, and of the most complicated shape, without taking any dimensions whatever on the ground. At the same time, the instrument draws the most crooked outline of any estate on the spot while working on the drawing-board, and all this is mechanically done by only managing the instrument in a very simple manner indeed. The instrument shortens immensely the necessary time of taking a survey, acting automatically, and the more difficult and complicated a survey in measuring with the chain or other instruments, the greater the advantage in working with Mr. Jahn's instrument, not being obliged to take any constructional lines, angles, or points whatever. The instrument would particularly become highly valuable wherever surveys were required to be done in the shortest possible time. Mr. H. H. Statham, junr., afterwards read a paper entitled "What is an Architect?"

CHURCH OF ST. NICHOLAS AT BLOIS.

THIS church consists of a nave of four bays, with aisles, and a narthex between the two western towers, transepts of two bays each, and choir of two bays, with double aisles on either side, the outer ones terminating easterly in small apsidal chapels. The choir finishes with a fine chevet of seven compartments, with three radiating chapels, but the most peculiar portion of this church is a circular lantern at the intersection of nave and transepts, vaulted in eight compartments, with ribs springing from corbels; each compartment has a two-light window. This lantern rests on pendentives of the type seen in the Byzantine domed churches of southern France. The choir bears evidence of having been erected in the twelfth century, but the nave is of later date. The church abounds in beautiful sculpture; we give illustrations of four of the capitals from the chevet, but there are many others equally characteristic.

CAST-IRON STOVES.

THE French Academy of Sciences has lately been discussing the unhealthy effects of closed cast-iron stoves. The result of experiments is to show that cast iron, when heated to a certain extent, is pervious to some gases and vapours, and allows the poisonous products of coal combustion to filter through it, so that a room warmed by a cast-iron stove soon has its atmosphere vitiated by carbonic acid. Hence the headaches and feeling of oppression of which many persons often complain who are obliged to sit long in apartments so heated. The Academy has appointed a committee of chemists to report fully upon this subject. A short time since, a physician of Chambery, in Savoy, was struck with the circumstance that an epidemic fever occurred in Savoy every winter, and he fancied that he had traced the cause to the use in the cottages of cast-iron stoves. It turned out from experiments made that hydrogen, carbonic acid, and carbonic oxide actually passed through the walls of the stoves, and the epidemic was thus accounted for.

SANITARY CONDITION OF LIVERPOOL.

THE annual report of Dr. Trench, medical officer to the borough of Liverpool, has just been issued. A slight improvement is perceptible in the death rate, it being 29·4 per 1000, or 3 per 1000 less than the average rate which has prevailed during ten previous years. Dr. Trench reviews at some length the work of court improvement which has been carried out under the provisions of the Local Sanitary Act of 1864. Three presentments have been made by the grand jury at the instance of the medical officer, and these presentments, besides ordering the total demolition of 384 houses, directed alterations to be made in 108. They required also the removal or the conversion into water-closets of 647 privies and open cesspits. "The one principle (says Dr. Trench) which chiefly regulated the plans of improvement was a desire to obtain the greatest amount of direct ventilation, and of the ingress of air and light to the houses of courts, at the least sacrifice of property. It is not, therefore, without interest to know that the demolition of 384 houses will directly benefit, by the open space thus acquired, 2174 houses, without weighing at all the other advantages to the neighbourhood and the town which will follow the eradication of hotbeds of contagious disease." The cost of the three presentments will amount to £75,509.

Some startling incidents are given in the report of overcrowding and indecent occupation. In 62 instances adult sons and daughters slept in the same room with their parents, and in three instances in the same bed. In 152 instances adult daughters slept in the same room, and in 56 instances in the same bed, with their parents. In 99 instances adult sons slept in the same room, and in 37 instances in the same bed, with their parents. In 214 instances adult sons slept in the same room, and in 158 instances in the same bed, with their mothers. In 37 instances adult daughters slept in the same room, and in 27 instances in the same bed, with their fathers. In 59 instances the mother, with her adult sons and daughters, slept in the same room, and in 21 instances in the same bed together. In 12 instances the father, with his adult sons and daughters, slept in the same room, and in 6 instances in the same bed together. In 7 instances a mother, adult son, and a female lodger slept in the same room, and in 2 instances in the same bed together. In 64 instances a man, his wife, and a female lodger slept in the same room, and in three instances in the same bed. In 12 instances, a man, wife, and male lodger slept in the same room. In 39 instances adult brothers and sisters slept in the same room, and in 20 instances in the same bed. "Surely," says Dr. Trench, "the position of these people is worthy of the consideration of the legislator, the moralist, and the teacher."

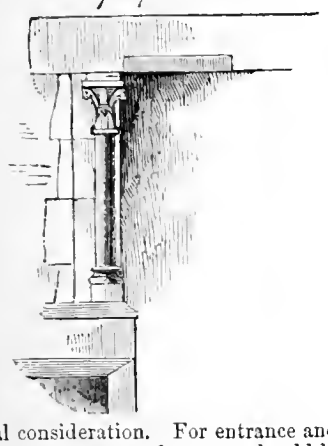
PEDDIE & KINNEAR, ARCHTS

Edwd J Harty, Lith

CONSTRUCTIVE AND ÆSTHETIC DESIGN.—NO. XIII.

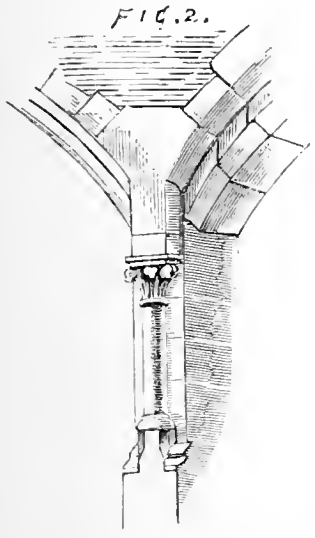
IN our public and domestic structures, the treatment of doorways and window openings, as these become more or less expressive of the character of the building, demands

FIG. 1.



special consideration. For entrance and exit, size and significance of purpose should be conveyed either by boldly recessed or splayed jambs, or by the addition of porches or lobbies externally or internally. The ordinary aper-

FIG. 2.



ture made in the thickness of the outer wall, which, in the majority of cases, is necessarily slight, affords little or no opportunity of obtaining effective depth of reveal of arch. Often, however, the ordinary thickness of wall

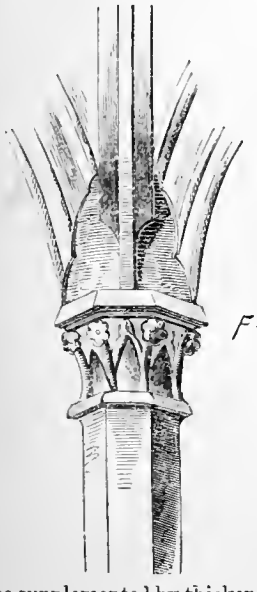


FIG. 3.

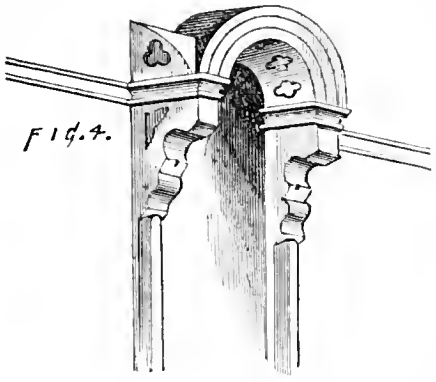
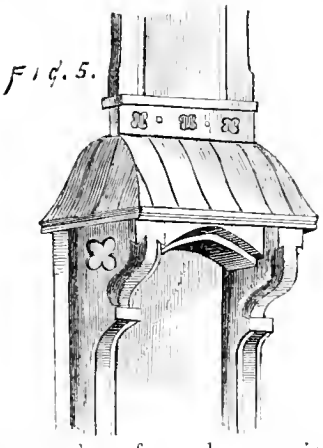
can be supplemented by thickening out, and a splayed recession of jamb may be obtained that gives all the effect required, at the same time strengthening the wall at the entrance. If external, this thickness can often be carried up one or more storeys, emphasizing the windows also, and forming a centre more or less marked. Angle shafts are, I think, eminently appropriate and artistic, both in position and material, for the jambs of doorways and

FIG. 4.



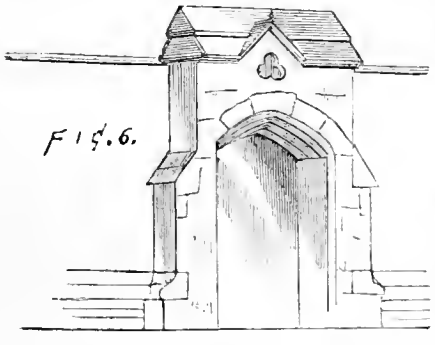
window openings, especially the former, and even flat-lintelled openings admit of their introduction (fig. 1); frequently, however, they are introduced for the love of display, being ostentatiously paraded wherever a simple splay or moulding would have done better. Thus we often see them perched on corbels, doing double service in supporting the heavy

FIG. 5.



crushing members of an arch; or again, often so slender and isolated as to appear the ludicrous mimicries of more substantial supports. The writer has occasionally noticed a central brick pillar surrounded by puny slate or marble shafts that give one the impression rather of iron bars or props, highly suggestive of buckling than of the artistic accessories of a stable shaft of masonry; and this defect is often quite as apparent when these pillarets

FIG. 6.



are tied or banded to the central shaft as in some of our Early English examples as seen in Salisbury and Chichester Cathedrals and Westminster Abbey. Figs. 4, 5, and 6 show designs for emphasizing door and window openings, and serving the office of hoods to them.

The "hangers" of the forthcoming Royal Academy Exhibition will be Messrs. Maclise, Sydney Cooper, and Calderon.

ARCHÆOLOGY.

The twenty-second annual meeting of the Sussex Archæological Society will take place in August next, in the Tunbridge Wells district, though the exact locality has not yet been determined on. The society appears to be in a flourishing condition, and Vol. XX. of its transactions is now in the press.

Mr. J. H. Parker, of Oxford, who is spending the winter in Rome, has lately read before the British Archæological Society there, a paper on the walls and gates of Rome in the reign of Servius Tullius, which he has been able to trace out in their entire compass.

At the meeting of the British Archæological Association on Wednesday evening, Mr. Holt exhibited the iron lock of the *dressoir de sacristy* of the parish church of St. Michael, Beauvais, a very beautiful specimen of the ironwork of the fourteenth century. Mr. Bailey exhibited Roman remains exhumed about two years since in Lombard-street, and bearing marks of fire, so far confirming the account of the fire of the time of Boadicea. It was announced that on the next evening Mr. Gordon Hill, who had been unable to attend on this evening, would read his paper on the "Discoveries at West Hampnett Church," and Mr. S. Cuming a paper on "Siguacula found in London."

During the demolition of an old house in High-street, Linlithgow, Scotland, in the course of last autumn, two interesting examples of decorative painting of the latter part of the sixteenth century were brought to light. On removing the comparatively modern plaster ceiling of the two rooms on the first storey, it was found that the underside of the flooring and joists of the room above were painted over their entire surface with heraldic and foliated designs. These had been executed in water-colour tempera, which, when exposed, was found to adhere very slightly, owing to the decay of the surface of the wood. The ceiling of another room was occupied with the heraldic blazons of fifteen barons and twenty-two earls of Scotland. Corouets were painted over the escutcheons of the earls, that of the Earl of Arran's differing from the rest in being foliated. A third room contained five escutcheons of Scotch nobles; the rest of the ceiling was filled with a conventional design, surrounding a terminal female figure, an emblem of the sun, human heads, griffins, and birds. The beams of both ceilings were decorated with a guilloche pattern in black. These interesting paintings formed the subject of a paper read before a meeting of the Society of Scottish Antiquaries last week, by Mr. T. E. Cooke, who has presented drawings of the ceilings to the society.

COMPETITION.

THE Metropolitan Asylum District Board have awarded, by the voice of the special committee, the first premium of £250 for the best plans and designs to Mr. Giles (Giles and Biven), for the asylum at Leavesden; the second, of £150, to Mr. A. Wilson; and the third, of £100, to Mr. F. H. Pownal. The following are the names of the competing architects, with their estimates:—Messrs. Tolley and Dale, £65,000; Mr. W. Lee, £82,000; Mr. F. H. Pownal, £108,800; Mr. A. Wilson, £91,000; Mr. J. Giles (first premium), £66,700; Mr. T. Worthington, £94,300; Mr. H. Jarvis, £78,000; Mr. M. P. Manning, £92,000; and Mr. J. E. Knightley, £125,000.

NOTICES OF PUBLICATIONS.

"Terra-cotta Chimney-shafts, Pots, &c." Parts 1 and 2. By J. M. BLASHFIELD: Stamford.

MR. BLASHFIELD, of Stamford, has published two parts of a work on the uses and application of terra-cotta. The work consists entirely of illustrations of terra-cotta chimney-shafts, chimney-pots, balustrades, panels, or perforated tracery ornaments, terminals, &c. He says, in the very few sentences of letterpress which accompany the illustrations, that Portland cement should not be used for filling in the interstices of terra-cotta work, as it is invariably disposed to expand in hardening, and frequently when used for such purpose bursts the work. Though the work is issued in parts, it does not pretend to be anything but a superior trade catalogue.

"A Treatise on the Petroleum Zones of Italy." By E. ST. JOHN FAIRMAN, F.G.S.: London, E. and F. N. Spon.

THE clear skies, the serene beauty, the marble quarries, and the vineclad hills of Italy have been

themes of observation for ages. We are now told by the author of this pamphlet, that Italy has another source of wealth, namely, petroleum. He says that he has witnessed very distinct indications of it in various places, and more especially in the provinces of Modena and Reggio. He says:—"We know from the testimony of the most ancient writers that petroleum has been known to exist in the spots I have indicated from time immemorial. Herodotus, Pliny, Spallanzani, Valisneri, Humboldt, &c., &c., &c., all speak of the Salse of Querzuola and of Sassuolo, and bear testimony to the fact of oil being collected by the peasantry from the surface of the oil springs for household purposes. In considering the enormous revenue obtained in America from this precious material, and the almost fabulous fortunes made by private individuals thereby in an incredibly short space of time, I have been led to believe most sincerely that the like splendid results would be obtained in Italy, were it possible to induce either the Italians themselves or foreign capitalists to engage in an enterprize which offers such fair hopes of a successful issue. I have explored the petroleum zones in that stretch of country which extends from the south of Milan to the south of Bologna, and along the confines of Modena commencing at Pavullo, and in several places I have detected the undoubted presence of petroleum; and in those spots more particularly described in this work, the indications are very strong."

"The Builder's and Contractor's Price Book for 1868." Revised by George R. Burnell: London, Lockwood and Co.

This well-known compilation is before us, but, difficult as it is to give judgment as to the merit of any severely technical work, a price book is certainly the most unsatisfactory. If the calculations in such a work are found to be clearly arranged and correct, it will, by weight of its own merit, command a sale; therefore, to say that this book has been through many editions, is, perhaps, the best praise that can be given. But something must be wrong somewhere in the manner of putting together the prices of these works, when they all differ to such an extent. Of three which lie before us, we will compare the prices for three items taken indiscriminately, and they will be found to differ seriously:—In bricklayer's work, take place-bricks laid dry in wells, &c., and the prices given in the three books are £9 5s., £10 9s., and £10 10s. respectively. In joiner's work, deal doors, 4 panel square, 1½in., the prices in the three books are, per foot super, labour, and nails, 5d., 6d., and 6½d. In mason's work, Yorkshire stone, labour on moulded work, per foot super, there are three prices in the three books, *i.e.*, 2s. 9d., 2s. 6d, and 2s. to 3s. 5d. We repeat that these prices are not picked out, but chosen from hazard. When the doctors differ to such an extent who can believe in their prescriptions?

WATER SUPPLY AND SANITARY MATTERS.

The Castleford Local Board offer a premium of £50 for the best water scheme for supplying the town with water.

The first stone of the new drainage works at Gibraltar was laid on the 20th ult. by Lady Airey, wife of the commander of the city and fortress. The works were designed by Mr. Edward Roberts, assistant surveyor of the War Department, under the direction of Major-General Frome, Commanding Royal Engineer. The contractors are Messrs. A. Kyan, of London, and the amount of the contract £35,000.

A complete system of drainage for the rapidly developing district of Westbury-on-Trym, which is separated from Clifton by the Durdham Down, is contemplated.

The Banbury Board of Health appears to be getting over its difficulties in the matter of applying the sewage to the land. The pipes have been laid and a reservoir built for some time; but, when they intended to commence, the condenser of the engine became too hot for working, and they had to leave off pumping to give it time to cool. This difficulty has now been overcome, but another has presented itself in the passage of the sewage under the two lines of railway, which interpose between the greatest part of the farm and the river. It is easy for it to cross, but the difficulty is to raise it again to the proper level to irrigate the remaining portion of the property.

Liverpool.—The Health Committee of the Liverpool Corporation were engaged, at their meeting last week, in discussing the subject of "jerry" building in that town, and several points of considerable importance were elicited. Dr. Trench, the medical officer of health, stated that, in spite of the efforts of the Health Committee, "jerry" builders and others managed to evade the laws and erect buildings hundreds of which were mere living tombs. He also pointed out as a curious fact that, while many of the streets through which the north-west breezes (prevalent at Liverpool) could blow direct from the sea were comparatively healthy, the streets nearest the mouth of the river had been for the most part built so as to exclude the westerly wind, and that in those districts fever and other diseases were rarely if ever absent. It was, he said, painful to think that, while the town council could vote thousands of pounds for parks, in which the working population could have but very moderate enjoyment, it seemed almost impossible, with the present legal enactments, to purify and cleanse quarters of the town where fresh air, light, and cleanliness were so necessary. Mr. Robinson, a member of the committee, said it was a lamentable fact that in Liverpool, the richest port of the United Kingdom, one in every eleven of the residents in the parish was in receipt of parochial relief—20,000 persons being out-door, and 5,000 in-door paupers. It also transpired that the Liverpool magistrates last week had fined two builders of the "jerry" class for building houses without mortar, street sweepings having been employed as a substitute.

Building Intelligence.

CHURCHES AND CHAPELS.

A south aisle is being added to Lillington Church, Warwickshire, similar to that recently erected on the north side of the edifice. Additional accommodation will thus be afforded for over one hundred persons, and at the west end of the new aisle space will be appropriated to the organ. Mr. W. Ballard is executing the work.

On Saturday last the new church of St. Peter, Birkenhead, was consecrated by the Bishop of Chester. The church, which is entirely built of brick, will, when completed, consist of a nave and aisles of five bays, chancel aisles, and chancel. Of these, however, only the nave and aisles with western narthex are as yet finished. The church will accommodate about 700 at a cost of £2,500, all the seats being free. Mr. David Walker, of Liverpool, was the architect, and the late Mr. John Hogarth, of Rock Ferry, the contractor.

The amount subscribed for the restoration of Holy Trinity Church, Hull, is £17,075. The tender of Messrs. Simpson and Malone for restoring the south side of the nave, at a cost of £3,450, has been accepted. The work will be at once proceeded with.

A new Moravian Chapel has been opened at Baildon, Yorkshire. The style is Gothic. The building will accommodate 600 at a cost of £1,400. Mr. S. Jackson, of Bradford, was the architect.

The laying of the foundation stone of the new nave of Bristol Cathedral is fixed to take place on the 17th of next month.

The twenty-eighth annual meeting of the Ripon Diocesan Church Building Society was held last week at Leeds. We regret to notice that, in consequence of a falling-off in the annual subscriptions, the society will be obliged, as it states, to diminish the scale on which grants had been hitherto made, and thus to impair the usefulness of the institution. The Bishop of Ripon, who occupied the chair, in moving the adoption of the report, gave one or two interesting statements of the society's labours during the twenty-eight years of its existence. It had contributed to the erection of 109 new churches, had augmented church accommodation in 47 different churches, and had provided altogether 66,396 additional sittings. The society had also been instrumental in erecting 148 parsonage houses, and had augmented the endowments of 77 poor livings. For the accomplishment of these objects it had raised and expended £88,595, though altogether these objects had required £472,710, and, deducting from that sum the £88,595, it appeared that the society had been the means indirectly of calling forth no less a sum than £384,115.

BUILDINGS.

On Thursday week the foundation-stone of the new District Schools of St. Titus, Liverpool, was laid. The design will be of a plain character, executed in grey bricks and stone dressings. The building will accommodate 500 children at a cost of £4,000. The architects are Messrs. Culshaw and Sumners, and the contractors, Messrs. Borroughs and Son.

A considerable improvement is now being effected at the corner of Fenchurch-street and Gracechurch-street, one of the busiest points in the city. The church of St. Benet is nearly demolished, and a large space of the opposite corner of Fenchurch-street has been rounded off and added to the roadway, affording room for another line of vehicles.

A central market is proposed to be erected at York-road, Battersea, by a joint stock company. Houses are rapidly springing up round the site, and seven railway lines already communicate with it. The land taken for the purpose adjoins the Thames, and it is intended to form a wharf for landing cattle.

New almshouses have been recently erected at Shepton Mallet. They accommodate four persons, and each comprises a living room, pantry, and bedroom. The walls are built of local stone, hammer dressed externally with Doulting quoins and dressings. Mr. Ferrey was the architect, Mr. Fudge, the contractor for masonry, and Mr. Stock, for carpentry, both of Shepton Mallet.

The new dock at Williamstown, Australia, the memorial stone of which was laid by the Duke of Edinburgh, will, when completed, be 420ft. in length over all, and 400ft. long on the floor within the entrance. It will be 97ft. in width on the top, and the entrance will be 80ft. wide in the clear. At ordinary spring tides there will be a depth of water of 24ft. 6in. on the sill at low water, and 27ft. at high water. The entrance will be closed by an iron caisson. The dock is built of the basaltic stone of the neighbourhood, known as bluestone, and is estimated to cost when complete, with pumping engines, &c., £185,000. The works of the dock were commenced in November, 1864 and its completion is expected by the end of 1869. Engineer, Mr. W. W. Wardell.

On Monday afternoon the foundation-stone of a new Masonic Hall was laid at Gateshead. The style adopted is Gothic, and the building will be entirely of stone. The estimate is £,1500. The hall was designed by Mr. Thos. Oliver, of Newcastle, and the contractors are Messrs. N. and R. Reed, also of Newcastle.

The Banquetting Hall, almost the only remaining portion of the old Mansion of Crosby Hall, Bishopsgate street, has been again adapted to its original purpose. It is opened as a city dining and refreshment rooms. The walls have been richly coloured, but the old constructive forms of Gothic stonework are plainly discernible. Mr. F. H. Francis is the architect, under whose supervision the works have been carried out by Messrs. Wallace, Gordon, and Co.

The Select Committee on the House of Commons arrangements, according to the *Owl*, have at present under consideration plans submitted by Mr. Barry for the construction of a new house, to be built across the east court, near the Speaker's residence. The entrance is to be from the present chamber, which it is proposed to convert into a vestibule. The new building will seat about four hundred and ninety members, and will be sixty-three feet square, with division lobbies thirty feet wide at either side. If sanctioned by Parliament it can be built and opened within two years at a cost of about £100,000. The committee are decidedly opposed to any suggestions for a tribune from which members should address the house.

The authorities of Islington are about to build a workhouse for 1000 inmates, with all the necessary offices. Although the architect's estimate was at £30,000, there have been so many alterations and enlargements of the original plans and elevations, that the work will it is now calculated cost £70,000

The erection of the new buildings for the Charter-house school at Godalming has been placed in the hands of Mr. Hardwick. An important Governors' meeting will be held as soon as practicable to consider the plans.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p m. on Thursday.

Notice.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

Correspondence.

PUGIN *v.* BARRY.

To the Editor of the Building News.

Sir,—So far as it is likely to serve his cause, Dr. Barry's lately published "postscript" had as well not been written. His arguments are weak and inconclusive. He charges Mr. Pugin with raising the question about the photograph drawing in order to take the matter "off the broad basis on which it had been placed." This, I am sure, is not true. The question of the authorship of the throne drawing has given greater popularity to the controversy, and many strangers to Mr. Pugin, including the present writer, have publicly expressed their opinion, but it is not just to make Mr. Pugin answerable for his anouymous and unknown friends. Dr. Barry says, that the initials in dispute refer to the Prince of Wales, and are accordingly placed where they might naturally be expected to be. I positively deny this. On reference to this design it will be seen that these historical letters are on the inside of the brattishing of the throne canopy, where no initials but those of the sovereign could reasonably be placed. The canopy over the seat of the Prince of Wales is on a much lower level, and quite distinct from the canopy of the throne. Moreover, the letters being on the back of the brattishing would, if executed as shown, be either invisible, as on a shield, or, if open cut, be seen reversed. If Sir Charles Barry was the clever author of this design, is it likely, with his fastidious carefulness, he would have made such a blunder as this? The letters, so it appears to me, are not a part of the design, and were only inserted as proofs of authorship by him to whom the initials belonged. Initials are not shown in any other part of the canopy as drawn, nor are any in the executed work. The reiterated statement about Pugin's practice of signing by a cipher is wide of the mark—exceptions prove the rule. The Doctor advertises his continual willingness to exhibit the original drawing to the Institute. Why does he not do it? Not only let the Institute see it, but the public. Only those who fear the truth need fear the light. *Fiat lux!*—I am, &c.,

Justitia.

Sir,—It is not necessary for Mr. E. Pugin to go to the aphorisms of "Junius," or any other party, for the language of personal abuse, so long as his own vocabulary is so very rich. I shall not imitate him either in his quotations or his own vernacular, but I will again assert that his statements, generally, have been untrue; that his subterfuges and contradictions have been apparent, and that his absurd and unjust assumptions have not been believed, as they were evidently made with a view more to his own advantage than for his father's honour. As regards the authorship of the drawing in question, I am as certain as I am of my own existence, that it is Sir Charles Barry's and not A. W. Pugin's. Mr. E. Pugin charges me with contradicting Mr. Herbert, or, to give his own choice expression, "having the insolence to give Mr. Herbert the lie"; but he forgets that I am one of the many who are prepared to do the same thing. Mr Clayton has done so in your last edition; besides, many other persons who have seen the original drawing will support me; amongst those I will ask Mr. Pugin if his brother-in-law, Mr. J. Powell, has not seen this drawing also, and has informed him that I am right and Mr. Herbert wrong?

Now, as to the design for the Throne, Mr. Herbert seems to have a "strange confusion of the mind" when he states he "so well remembers Mr. Barry sending Mr. Pugin the design for this Throne," which he calls a "testa," in disparagement of it. Now, if Mr. Herbert, on Mr. Pugin's behalf, repudiates this design, how is it that he now is so anxious to claim it for Mr. Pugin by false statements? or, how is it that Mr. Herbert, who expresses so much esteem that he would "gladly have made a bridge of gold for Mr. Barry" (see letter in Building News, March 6), should not have gone in an honourable way to the said Mr. Barry and have satisfied himself before he made the grave charge against him in the *Standard* that he was passing one of Pugin's drawings off as having been made by his father, as, in the letter of Feb. 24, where he states, "The photograph is taken from the actual drawing made under my eye"; and, further, "the man who could have made this drawing must have had your father's (Pugin's) power of doing all that he accomplished before and after." Mr. Herbert continues that he is "shocked at seeing that Messrs Barry should have made so grave an error."

Now that the authorship of this drawing is beyond a doubt, these statements cannot be facts, and the public will be "shocked" at the very hurried way in which Mr. Herbert has "rushed" into print" to prove rather too much for Mr. Pugin, and will add them to the long list of mis-statements which have been so abundantly put forth to assist the absurd claims for honours which his father had repudiated both publicly and privately.

I do not desire to be drawn into further controversy with Mr. E. Pugin, as his letters are repetitions of mis-statements, with more or less of the element of personal abuse mixed up with them; but, as the question of the authorship of the drawing of the Throne is one of fact, and not of controversy, I have felt it to be a duty to give my positive evidence when I saw a grievous wrong being attempted.—I am, &c.,

Talbot Bury.

50, Welbeck-street, W., March 25, 1868.

[We have no desire to vindicate Mr. E. Pugin's style, as we think that he weakens his cause by the unnecessary introduction of unwarrantable epithets. Mr. Talbot Bury, in rebukiug Mr. Pugin, falls into a similar error. He accuses Mr. Pugin of advancing "absurd and unjust assumption, evidently with a view more to his own advantage than for his father's honour." This is about the worst charge one man can make against another. Mr. Bury goes on to disprove Mr. Herbert's statement. Mr. Herbert says, "I saw Augustus Pugin make the design for the Throne." His statement is direct, lucid, and consistent. He introduces circumstantial minutiæ to sustain the statement. Mr. Bury contradicts Mr. Herbert. He is as certain that Sir Charles Barry made the design for the Throne "as he is of his own existence." On what does this certainty rest? on the evidence of his senses? Did he see Sir Charles Barry do the work? Nothing of the kind. He only *infers* that the design was made by Sir Charles's own hand. Now, Mr. Herbert, whose testimony is unpurchasable and whose reputation is European, is certain that Augustus Pugin made the design, because *he saw him do it*. Mr. Herbert used the word "drawing" in the first place, but he subsequently corrected himself, and said he meant "design." If Mr. Bury can't see that his small wave of inference breaks into spray against Mr. Herbert's rock of certainty, he is not likely to continute anything important to the controversy. Mr. Bury not only questions Mr. Herbert's truthfulness—in fact, he is "one of the many who are prepared" to do it; but he questions Mr. Herbert's honour, or "he would have gone in an honourable way to Mr. Barry," and he questions his prudence for "rushing into print." The great majority, however, who do not rush into print will no doubt take another view of it, and will continue to regard Mr. Herbert as pre-eminently a veracious and an honourable man, and they will not think less of him because he has stepped forth chivalrously and tendered his unassailable testimony in vindication of a departed friend.—[Ed. B. N.]

Sir,—To meet the fatal objection, viz., that the Throne drawing bears no evidence of his father's style, Mr. E. W. Pugin now makes the suicidal admission that it may be a copy of his work, made by Sir Charles Barry to hide a dreaded evidence of his aid. On the contrary, Mr. Herbert, upon whose testimony so much reliance has been placed by Mr. E. W. Pugin, avers confidently that he saw the drawing in question while progressing under the hand of Mr. Pugin, whose initials in signature he states he has lately, by aid of a lens, discovered thereon.

These statements obviously destroy each other; for, firstly, if the drawing bears initials signifying Mr. Pugin's authorship, it cannot possibly be a copy by Sir Charles, whose object, in the otherwise superfluous process of reproduction, would be, according to Mr. E. W. Pugin, not to give evidence of Mr. Pugin's work, but expressly to conceal it. Secondly, if the drawing is an original by Mr. Pugin, Mr. Herbert, in remembering to have seen it in progress, would remember also to have been astonished that his friend should belie his natural style by working in one foreign to it

It is not at all necessary, as Mr. E. W. Pugin suggests, to doubt, in rejecting Mr. Herbert's evidence, his entire sincerity in giving it; such a doubt concerning such a man is out of the question. On the other hand, there is no unfairness in supposing that Mr Herbert may be mistaken as to the exact details of a passing incident which took place a quarter of a century ago.

At the Arundel Society's rooms there was exhibited lately a collection of drawings referring to the Throne. One of these, a general design for it, was, beyond all possibility of doubt, by Mr Pugin, the full evidence of whose hand was patent in every touch. It was quite unlike the drawing previously referred to, equally in manner of design and style of draughtsmanship. As in the case of all his other numerous drawings for Houses of Parliament work which I have seen, it bore no initials in signature, but it was freely treated with decorative lettering—clearly, though delicately, defined in fifteenth-century character—in accordance with the general style of the design, and Mr. Pugin's habitual consistency in this respect

By the light of this drawing, which is, no doubt, the one Mr. Herbert saw in progress, reasonably under no surprise as to its style of manipulation, it is easy to understand the mistaken impression under which he has given his opinion in this matter. But, apart from the question of draughtsmanship, there is, I believe, in the disputed drawing, intrinsic evidence which goes far indeed to prove Sir Charles's authorship as to design therein. The repetition of vertical and horizontal lines in uniform order, natural to one trained in a Classic school, and much displayed in the design of the river front of the Houses of Parliament, has been often, justly or unjustly, the object of censure against Sir Charles—notably by Mr. E. W. Pugin himself—who has described how different its treatmeot would have been at the hands of his father; and yet this confessedly un-Puginlike symmetry of square forms and general motive of design are no more stamped upon the river front than they are upon that of the Throne. The general rigidity in the lines of the Throne, and absence of curved forms, which were prominently displayed, and, I think, evidently enjoyed by Mr. Pugin in his version of the same subject, recently shown at the Arundel Society's rooms, were at the time when the work was carried out felt by those, including myself, who were engaged upon it, to be Barry-like without doubt, and therefore essentially un-Puginesque.

The question raised on the Throne drawings represents the key of Dr. Barry's position; for, holding it, he will prove what I think need never have been doubted—that the scope of Sir Charles's powers in design extended far more over elaborately detailed work than Mr. E. W Pugin admits. On the other hand, Mr. E. W. Pugin, could he carry the position, would, after all, prove no more than has been known, and on all sides freely admitted, in honour of his father's genius in designing work more or less of the kind about which so much has been said.—I am, &c.,

John R. Clayton.

311, Regent street, W., London, March 25.

P.S.—It will be obvious that the phrase "15 cut characters," in my letter of last week, was a misprint for "fifteenth-century characters."

Sir,—Mr. Herbert having doubtless quite enough to occupy his time and attention, may I ask space for a few remarks on the letter in your journal from Mr. Clayton, which, rather flippantly, reflects on Mr. Herbert's artistic, no less than his intellectual perceptions?

1. Mr. Herbert is known to be a great artist, and he was the most intimate friend of the late Mr. Pugin; but I have yet to learn on what ground Mr. Clayton rests his pretensions to sit in judgment on Mr. Herbert's convictions or theories on Mr. Pugin's "nature." Mr. Clayton seems to have been originally a modeller of Mr. Pugin's sketches, and is now, I believe, eminent as a glass stainer, but I think these are scarcely qualifications entitling him to place himself on a level with an artist, who can form a better estimate of touch and feeling than either architect or modeller. The photograph in question has been submitted to several artists of eminence, who are conversant with Mr. Pugin's style, and with one coosent they all recognize in it those characteristics which mark it as his. How it can seriously be considered as "entirely different" to his passes my comprehensioo, for the most cursory glance at it will convince anyone who ever saw one of Mr. Pugin's etchings that at all events it is a very successful copy or imitation of his style, and a complete verification of Mr. Edward Pugin's assertion that Mr. Talbot Bury informed him "Sir Charles Barry had so successfully mastered Mr. Pugin's touch, that he scarcely knew his own drawings." Are there any more such drawings said to be the work of Sir Charles Barry?

2. I beg to remind Mr. Clayton that Mr. Herbert did not "seek to establish the identity of Pugin's hand in the Throne drawing by a search thereon for his initials"—he had previously pronounced it to be Pugin's from a simple recognition of his style and touch. He said, "The man who could have made this drawing must have had Pugin's power of doing all that he accomplished before and after." This judgment of an artist on the production of a brother artist, coupled with the fact that Mr. Herbert with his own eyes saw Mr. Pugin make the drawing for the Throne, must, in the judgment of all disinterested persons, outweigh the most plausible considerations against it. It was when Mr. Herbert's testimony met with a flat and scornful denial that he instituted a search for the initials in the expectation of finding them, and his discovery only confirmed a decision at which he had arrived irrespective of it, although it seems to me perfectly immaterial whether the original drawing is Sir Charles Barry's or not—without Mr. Pugin's mind it could never have existed.

3. The photograph, we are told, is reduced from a large

original drawing, defaced and dirty, whereupon Mr. Clayton immediately argues that it is not Pugin's, because it does not come up to his delicately executed drawings. Can anything be more absurd than to declare it never was an etching at all, and then to decide on its authorship as though it were? Is it probable that such a sketch would be as daintily touched as an etching of one of Mr. Pugin's volumes of compositions? Mr. Clayton's compliment about the "swish-tail lions" cuts both ways. If that interesting animal could be clearly drawn within a circumference little bigger than a pin's head, why not A W P, which equally interesting "wormy wriggles" (so strangely taking the form of Mr. Pugin's well known initials), let the Messrs. Barry say what they will, in the words of a living architect a natural enema of Pugin, *pere et fils*, "nothing can ever wash out." Will, however, anyone believe that Sir C. Barry admitting that he made the drawing in question, had in his mind *Arthur Wallace Princeps*, when he introduced the letters "A W P" on the Queen's Throne, and not on the Prince of Wales's?

I take this opportunity of saying that in the volumes of the late Mr. Pugin's etchings and drawings, now in my custody, his name and monogram appear in fifteen different ways, so Mr Talbot Bury, as usual, is wrong.—I am, &c.,

T. J. Burton.

21, Savile row.

P.S. After being informed by Dr Barry that out of the 3000 working drawings made for the Houses of Parliament, only 70 for internal fittings by Mr Pugin can be found, we are now told that "a drawing of the Throne by Mr. Pugin for the estimate drawings (in 1850) is still extant." It was surely unnecessary for Mr. Herbert to notice any description of the nature and object of the estimate drawings by Mr. Gibson and Mr. Banks, as we were informed that they amounted to 200. How then could Mr Herbert assume their existance in order to argue that they had been destroyed, when their existence was confessed?

Intercommunication.

QUESTIONS.

[778.]—STONE CARVING.—I shall be glad if some of your correspondents will kindly give me a little information as to stone carving, stating the various tools required, and the stone used, and what books are published on the subject in a cheap form.—H. C.

[779.]—AGREEMENTS.—I shall feel obliged to any of your readers who will inform me whether a sub-contractor can force a builder to pay for work he may have done, if the sub contractor has not got a copy of the agreement that was drawn up when he took the work to do, and if the agreement should be stamped or not?—A Constant Reader.

[780.]—PLANS THE PROPERTY OF ARCHITECTS.—May I ask you to answer the following question for me? An architect, having designed plans and made specifications for a building, the property of a Joint Stock Company, Limited, and received the usual commission for them, and for the superintendence during the erection of the building, at its completion, upon being asked for the original plans, &c., states that they remain the property of the architect. Is it usual for architects to retain their designs, or to give them to the person or persons at whose order the plans were made?—Nemo.

[Drawings are always considered to be the property of the designer, for a case in point see Murray v. Giles in the Building News for November 29, 1867.]

[781.]—MOUNTING DRAWINGS.—If you, or any of your readers, will inform me through the "Intercommunication" of a method of mounting drawings, I shall feel obliged.—T. M.

[The kind of drawings to be mounted ought to have been mentioned; if they are water-colour drawings or plans, place them face downwards upon a clean dry board, wet the paper with a sponge (taking care that the water does not run under to the face of the drawing), and then, when the paper is saturated, take it up carefully by the corners, put it in its place upon the mounting-board, and stick down the edges with very liquid glue, place clean blotting paper over the drawing, and a drawing board or book of the size of the mount, and leave it until dry. Great cleanliness and care must be used in the whole of the operation.]

[782.]—FRENCH IRON SHUTTERS.—Can any of the readers of the Building News inform the writer the name and address of the makers of the plate iron shop shutters so extensively used in Paris, and whether the French firm have any agents in England of whom particulars may be obtained?—A. H.

[783.]—DILAPIDATIONS.—Will you, in the replies to the next number of the Building News, inform me of the best work upon dilapidation of residences connected with the clergy or laity, the price and where to be obtained.—W. King, Ashford.

[The latest work upon dilapidations, lay and clerical, is by Morris, published by Simpkin and Marshall, price 4s.]

[784.]—"PRACTICAL BUILDER" AND TREATISE ON CIRCLES AND RAMPS.—Will you be so kind as to inform me in your Correspondence, as early as possible, first, the title, in your opinion, of the best "Practical Builder"; second, the best treatise on circles, ramps, twists, and oblique arches?—N. D. B.

[785.]—PAYMENT FOR MEASURED WORK.—I am a builder, and have erected buildings for a person, as per agreement, to be measured and valued by a certain licensed surveyor employed by me. He measured the work at the appointed day, for which I paid him his demand of £2 2s. He gave me a lump sum of his valuation, and refuses to give a detailed estimate. The proprietor refuses to pay without a detailed estimate. Can I, by law, compel payment with the lump sum? if not, can I sue the surveyor to recover damages?—W. M. L.

[W. M. L. cannot recover from his employer, for measured work done, unless he produces a detailed account. If the surveyor agreed to measure and value the work for the fee of two guineas, you are entitled to a detailed account from him; but, unless he made a special arrangement with you for that sum, he is entitled to 1½ per cent. upon his valuation of the work, for which fee he will, no doubt, furnish you with the detailed estimate you require.]

[786.]—QUALIFICATIONS FOR DISTRICT SURVEYORS.—Will you, or some of your readers, be kind enough to inform me what are the qualifications necessary for a district surveyor? Could you inform me upon what subjects candidates for certificates of competency to act as district surveyors are examined by the Institute of British Architects?—Colonies.

[Information as to the subjects beyond the Metropolitan Building Act which examiners of the R. I. B. A. require, may be obtained from the assistant secretary, C. L. Eastlake, Esq. The meetings of the Board of Examiners will be held on the last Fridays in April, July, and October, 1868.]

[787.]—MEANING OF BEING ARTICLED.—Would you, or any of your numerous readers, kindly inform me what is the meaning of being "articled" to an architect, and what benefit is derived from being articled?—T. V. A.

[The term "being articled" means the same as "apprenticeship." From "articles of indenture" the benefit supposed to be derived is, that the master engages to teach what he knows, and the pupil engages to work for his master at all reasonable or usual hours. But, architecture being at present an open profession, the only formality which is often gone through before a man takes up with the work, is to order a brass plate with his name, and Mr. before it, get a clerk who can do the work, and obtain clients if possible.]

[788.]—WATERWORKS AND RESERVOIRS.—I require a good work upon designing and constructing of waterworks and reservoirs. Please inform me in your next number the best work or works to purchase, with latest improvements for filters to same, &c.?—G. H.

[789.]—COST OF GRAVING DOCK.—Would you have the goodness to inform me in your next issue about the cost of an ordinary graving dock?—Workman.

[Under favourable circumstances, with materials near at hand, and good foundations, an ordinary graving dock might be built for about £8,000. It is quite impossible, however, to give an accurate estimate without knowing the particulars of the site and size of dock. Within our own experience graving docks vary from one hundred to five hundred feet in length. A slip, which will answer the same purpose as a graving dock, only not so effectively or conveniently, may be constructed for about a third of the above sum.]

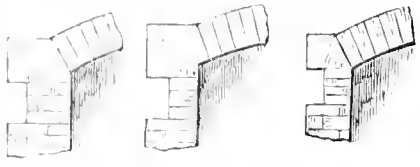
[790.]—BOOK OF DESIGNS FOR CARVINGS.—I have been told there has been recently published a book of designs for carving stone, such as basins, tree-nuts, and carvings of every kind, so as to get a pleasing variety. I should be much obliged by being informed where I could obtain the above designs?—W. F. H.

[791.]—MEASURING WORK.—I am in a fix. The shop where I work has started piece work (Laxton's book). Could you, or any of your correspondents, inform me where to get the price of my work made out; if so, you would oblige an old subscriber?—A. Y.

[If the correspondent "A. Y." cannot measure his own work from the prices given in "Laxton's Price Book," he had better apply to a respectable surveyor, who, for a small fee, will put him into the way of it, or if he writes more fully, stating exactly his trade and difficulties, he will probably find his queries answered through the "Intercommunication" column.]

[792.]—SECTION OF ROADS.—Will you, or any of your readers, inform me whether roads less than 15ft. wide should have one or two water-tables? I refer particularly to the roads under the management of Highway Boards and their surveyors.—G. P. D. P.

[793.]—SHAPE OF ABUTMENT STONES.—Is there



any rule for the shape of abutment stones, either in Classic or Gothic; or is it purely a matter of taste?—F.

[794.]—APPRAISERS' LICENCE.—Would you kindly inform me whether an architect requires an appraiser's licence, or any other licence, to enable him to measure off a building, and determine the value of the extras, &c.?—J. H. Smith.

[It is not necessary for an architect to take out an appraiser's licence, or any licence whatever.]

[795.]—LACQUERING SILVER.—Will you please to let me know how a silver surface is lacquered; and whether a green lacquer can be obtained, and where?—X. H.

[796.]—MEASURING PROPORTIONS.—There is a plan, I am told, of measuring the proportions of objects when sketching in the open air. If there is such a method, I should be glad to know how it is done.—Juvenis.

[797.]—HALF-TIMBERED ERECTION.—What are the best methods of building half-timber erections, so as to keep them perfectly air-tight?—W. W.

[798.]—DECAYED STONE.—What is the best way to preserve stone that is much decayed, supposing that it is inside work, and that it is important the present face should not be disturbed?—Free Mason.

REPLIES.

[740.]—KAMPTULICON.—Kamptulicon does not wash like oilcloth; but it appears somewhat useless to lay any covering down upon a floor which rots oilcloth. I should recommend your correspondent to take up his flagging and lay down a 2in. coat of asphalte, mixed with fine dry gravel and sand, which would make a hard and dry floor.—K.

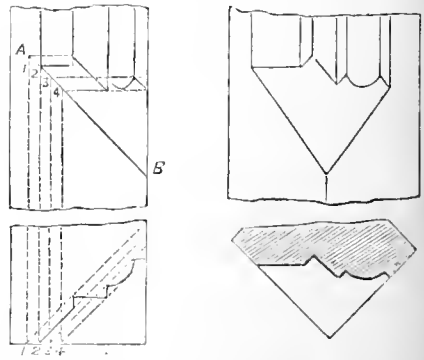
[741.]—GOTHIC WINDOWS.—I should be inclined to consider the work alluded to as "moulded work," which, in such instances—especially when the moulding is small—is measured by the foot super. At the same time, the cubical contents of the stone should be calculated as it comes in from the banker.—Granite.

[748.]—BORING GLASS.—This somewhat difficult operation may be safely performed by the following means:—The instrument to be employed is a steel drill, not tempered too highly; and the precaution must be adopted, in the first place, of wetting the surfaces of the glass in the proximity of the intended hole with a solution of spirits of turpentine and camphor gum, and feeding the drill in its progress with the solution, in precisely similar a manner to that in which the fitter keeps the drill wet with soap and water whilst boring through wrought iron. The glass must be drilled quickly, but lightly.—Glazier.

[752.]—CREOSOTING.—Your correspondent does not appear acquainted with the fact that balks of timber intended for piles or sleepers are only creosoted by means of powerful pressure, the solution being forced into them. Some description of timber would never absorb 10lbs. of creosote to the cube foot; and one of the great disadvantages attendant upon the employment of the native woods in India for railway sleepers is that they are of so hard and close a texture as to defy all attempts to creosote or otherwise increase their durability by impregnating the pores with a preserving solution.—S. L.

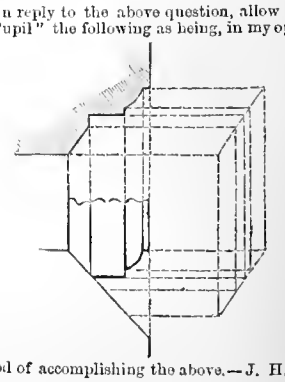
[765.] HOW TO MAKE LACQUER.—Will you allow me to inform your correspondent that the base of all lacquers consists of shell-lac dissolved in spirits of wine, and that a good proportion for mixing is a pint of purified spirit to three ounces of pulverised lac. The mixture should be digested for some days at a moderate heat, and subsequently cleared by settling and straining. The addition of gamboge and anatto, either separately or in different proportions, affords various degrees of colour. The former imparts a pale yellow, and the latter an orange tint. A golden colour is produced by using two parts of gamboge to one of anatto, and any other tint can be obtained by adding the colouring matter. To lay on the lacquer after it is prepared, the article must first be thoroughly cleaned, if necessary by the use of an acid, and the operation performed by a proper brush. It is necessary to repeat it four or five times to bring out the colour.—M. M.

[772.]—GEOMETRICAL ELEVATION OF MOULDED CHAMFER.—The enclosed sketches, will, I think, show "Pupil" how to get the elevation of moulded chamfer, stopped, on plane face, at an angle of 45 degrees. Fig. 1



is a front elevation; fig. 2, angular elevation. Lay down the section of moulding as in fig. 1.; draw the lines 1, 2, 3, 4, on plan, parallel to the plane of the stop, touching all the angles of moulding. Draw the line A. B. in elevation, and from 1. 2, 3, 4 on plan draw lines to intersect A. B. From these points of intersection draw the lines 1, 2, 3, 4 to intersect the vertical lines of moulding at right angles. Observe the points that each line pass through on the plan, and by drawing lines through corresponding points that intersect the vertical lines it will give the elevation of the mouldings on the stop. Fig. 2 is traced from fig. 1.—J. Richards.

[772.]—In reply to the above question, allow me to suggest to "Pupil" the following as being, in my opinion, the



best method of accomplishing the above.—J. H. Spanton.

[773.]—PHOTOGRAPHS.—Photographs from Turner's National Gallery pictures are to be obtained, 17in. by 12in., from Marion and Co., 23, Soho-square.—S.W.

STATUES, MEMORIALS, ETC.

In September, 1865, the committee of subscribers to a national memorial to the late Prince Consort having chosen a design made arrangements for proceeding with the work. The design selected was by Mr. John Steell, R.S.A.; and consists of an equestrian statue of the Prince placed on a pedestal, with bas reliefs in panels, and groups of figures at the basement angles. The sculpture is to be in bronze, and the pedestal in granite. But sufficient progress has been made to enable one to form an opinion of the details and individual portions of the memorial. The statue is twice the size of life, and represents the Prince in the uniform of Field Marshal, as he appeared at the great volunteer review in 1861. Mr. Steell has completed in bronze three of the four bas-reliefs for the panels of the pedestal, and has sketched out the fourth. The two side panels are over 9ft. in length, and 2ft. in depth, and the end ones 3ft. in length, and 2ft. in depth. One of the side subjects is the marriage of the Queen, and contains upwards of eighty figures, the principal of which are in high relief. The other side panel contains an elaborate representation of the opening of the Great Exhibition of 1851 by the Prince Consort. The front panel will show the Prince at home, surrounded by his family. The four groups, which are to stand on a projecting base opposite the angles of the pedestal, each consist of three life-size figures, represented in the act of paying homage to the Prince. One of the groups is being modelled by Mr. Steell, and the others respectively by Messrs. Brodie, Clark Stanton, and Macallum.

The statue of Napoleon I., one of the *chefs d'œuvres* of Canova, which under the reign of Jerome stood in the Salla des Etats, Westphalia, has been found, it appears, in a haytoft of the garrison at Cassel. In 1812 it had been thrown down and broken. The French consul at Frankfort has made application to the Prussian authorities for the mutilated parts, in order to have them restored.

A memorial has been erected over the grave of the Scottish poet, Robert Tannahill, in the churchyard of his native town of Paisley. It consists of a pedestal about 4ft. square at the base, and 10ft. in height. The style is Roman, and the material grey granite. On the shaft is a polished plate, bearing the inscription, "Tannahill, born 3 June, 1774; died 17 May, 1810." The monument was designed and executed by Messrs. Gordon and Barclay, sculptors, Paisley.

WAGES MOVEMENT.

The journeymen painters of Penrith are now out on strike, in consequence of the refusal of the masters to concede to the demands of the men for an advance of wages to the extent of 2s. a week.

A considerable reduction has taken place in the metropolis in the contract prices of granite, road materials, and mason's and paviour's work. The contracts taken by the vestry of St. Pancras for the year ensuing show a considerable fall in the value of materials as compared with those expiring, and the following reductions, by contract, have also taken place in wages:—Masons from 6s. 8d. to 6s. per day; paviours, 6s. to 5s. 6d.; hammermen, 4s. 6d. to 4s.; stone dressers, 7s. to 6s.; labourers, 4s. 1d. to 2s. 6d.

LEGAL INTELLIGENCE.

ARCHITECTS' CHARGES. — The parties to this action were Mr. Peachey, architect, of Darlington, and the Rev. Ernest J. Towne, of Forcet. The action was brought to recover remuneration for work done, journeys made, and cost of goods sold. The defendant pleaded never indebted to all but £54, which amount had been paid into court. In 1864 the defendant employed Mr. Peachey to prepare plans for the erection of a parsonage house at Forcet. Tenders were obtained and the work was then begun. When nearly completed a misunderstanding arose, which ultimately led the defendant to inform Mr. Peachey that his services were no longer required, and he accordingly sent in his bill, desiring immediate settlement. The plaintiff, though he had prepared two sets of plans, had only charged for those which guided the building of the house, and the points at issue in the action were of a minor character, namely, as to the right of the plaintiff to charge commission upon certain building materials and labour which had been gratuitously supplied towards building the house, the cost of journeys, &c., and also as to neglect of the plaintiff. In reply to the plaintiff's evidence, it was argued that it was the duty of an architect to see the work properly done, and this had not been done in the present instance. In support of this it was stated that "stoothing" the house, which was in the specification, had not been done; defective nails used in the roof had rendered roofing over again necessary; windows and shutters were defective; and Mr. Ross—another architect—had to be employed and paid to finish the work, which, after Mr. Peachey had given his certificate of completion to the Ecclesiastical Commissioners, had to gain the sanction of that body, costing Mr. Towne no less a sum than £167. The witnesses on behalf of the defendant were Mr. Christian, the Ecclesiastical Commissioners' surveyor, who had given 71 items for alteration in the work before it could be passed as according to specification; and Mr. Ross, architect, who had surveyed the work after Mr. Christian, and entirely agreed with him as to the necessity of the alterations he had pointed out. For the plaintiff it was contended that he had been precluded by his sudden dismissal from seeing that the builder properly completed his work. After his dismissal he had no other course than to certify to the Ecclesiastical Commissioners, and when he did so all the work thus far done was performed with reasonable skill and care. The jury returned a verdict for the plaintiff—damages £5 8s. beyond the amount paid into court.

AN ARBITRATOR'S AWARD DISPUTED.—Edwin Hall *v.* John Madeley.—This case had been referred to the arbitration of Mr. John Webb, builder, of Silverdale. The plaintiff, for whom Mr. A. Tennant appeared, is a builder at Madeley; and the defendant, for whom Mr. Litchfield appeared, is a bricklayer at the same place. Mr. Litchfield objected to the award (which was in favour of the plaintiff, for £6 2s. 5d.), on the ground that there was misapprehension in appointing the arbitrator, the defendant supposing that he was a surveyor, whereas he afterwards found that he was a builder; that he did not examine the witnesses on oath; and that he did not take proper means of ascertaining the facts.—Mr. Tennant said it was a very serious thing to make a charge like that against an arbitrator.—Mr. Litchfield said he did not wish to say that the arbitrator had intentionally acted wrongly, but he had acted without understanding the matter.—His Honour said that there was no reason for disputing the award.

OBSTRUCTION OF LIGHT AND AIR.—Rolason *v.* Levy.—This case came on originally on motion for injunction, but, by arrangement, was heard recently, before Vice-Chancellor Malins, on motion for decree. The question raised was whether a man having demised property adjoining his own to another person for the whole of his term less one day, can have a remedy against him for altering the height and dimensions of buildings standing on such property, there being likewise a covenant in such demise that no building should be erected on the demised premises so as to obstruct the light and air between certain specified points. The plaintiff was a jeweller in Vyse-street, Birmingham, and on the 29th of September, 1863, executed the demise in question to the defendant, a watchmaker, of the adjoining house and a court-yard running at the rear between the houses, divided by a party-wall a few feet in height. The defendant had commenced building operations on the court-yard, and it was alleged by the plaintiff that such building not only encroached on the court-yard, but it was intended to carry up the erection a storey higher than the old buildings. This, it was also alleged, would materially obstruct the light and air coming to the plaintiff's ancient windows looking into the court-yard, and it was held that there was, on general principles, an illegal obstruction of light and air, and a breach of the covenant in the demise. It was contended, for the defendant, that the limits of the restoration in the covenant were too uncertain to give the plaintiff any remedy, and that on the question of ancient lights the law was, that the building being upon land which he had himself demised, he had no remedy. There had also been acquiescence.—The Vice-Chancellor, without hearing a reply, was of opinion that the plaintiff would sustain such a material injury to his light and air as, on the authorities, to entitle him to an injunction. There had also been a breach of the covenant, inasmuch as, whatever the lines in the plan meant, it was clear that everything within them was comprehended; and the whole width of the yard being 17 feet, it was obvious what the effect would be if that was reduced. The plaintiff and defendant were, in fact, landlord and tenant, the demise being an underlease; and, although perhaps the covenant contemplated some building, it was clear that the windows of the plaintiff were ancient lights, and the defendant had no right to interfere with them. There must be a perpetual injunction with costs.

MEETINGS FOR THE ENSUING WEEK.

TUES.—Institution of Civil Engineers,—"The City Terminus Extension of the Charing Cross Railway," by John Wolfe Barry, M. Inst. C. E. S.

WED.—Society of Arts,—"How to make Railways Remunerative to the Shareholders, Beneficial to the Public, and Profitable to the State," by Raphael Brandon.

SAT.—Associated Arts Institute,—"On Modern Art Treatment of Sacred Subjects," paper by J. P. Davies.

Our Office Table.

The Duke of Argyll, Lord Elcho, the Dean of Ely, and Mr. Bennet Woodcroft have consented to become vice-presidents of the Workmen's International Exhibition of 1869; and the Earl of Lichfield, Earl Spencer, and Mr. Titus Salt are guarantors.

Mrs. Siddon's house in Upper Baker-street (No. 27), which was condemned to be demolished in order to make way for the new branch railway to the "Swiss Cottage," is to be spared after all. The house in which the great actress lived and died is now the Portman Estate office.

It is complained that, although two marble drinking-fountains were, during the last recess, placed in what is commonly known as the Committee-room, Corridor, or Long Gallery, in the House of Commons, for the use of witnesses, &c., they have never been made available. Though committees have been sitting for some time, the fountains remain dry, and witnesses thirsty.

For a considerable time past the inconvenience arising from the smallness and the limited accommodation of the harbour at Scarborough has been greatly felt, more especially by those connected with the fishing trade. The Piers and Harbours Committee accordingly have resolved to expend £150 in procuring a report, with plans and estimates of the cost of a new western pier, having for its object the improvement and extension of the harbour.

Mr. John Mellor, of Derby, an antiquary, who states that he discovered the remains of King Alfred at Hyde Abbey, Winchester, and who recently visited Leicester for the purpose of examining the Abbey grounds, believes the church to have stood east and west, on the right hand, or south side of the second central garden wall, where he found the Lady chapel tiles curiously marked. He further says, "in this chapel the great Wolsey lies buried in a metal coffin, with suitable ornaments, such as episcopal mitre, gorgeous vestments, crozier, ring, and cardinal's shoes, and that a few well-directed endeavours might yet bring the coffin to light."

An American company recently hit upon a novel idea, and not a bad one either. The Loohiel Ironworks Company, near Harrisburg, Pennsylvania, promised their workmen a grand oyster supper if they would turn out 1500 rails in one month. The workmen turned out 1565, and the supper was given. Among the workmen were several negroes who sat down with the rest, and we are told were as kindly treated as the others.

An exhibition of arts and manufactures is to be held in Aberdeen next year, the arrangements for which are now far advanced. The exhibition will consist of two branches—one an art collection, including art manufactures; the other industrial, including material and machinery, as well as manufactures. It is intended that the whole collection exhibited shall be drawn from the northern counties of Scotland, except in respect to the works of native artists, and the products of native workmen's skill or ingenuity which will be sought for wherever they can be procured. The time of the exhibition will be the months of July, August, and September, 1869. The Queen has consented to patronize the undertaking, and the Prince of Wales allows himself to be named president.

In the competitive trials for drawing, conducted by the Science and Art Department, South Kensington, which took place on the 10th, 11th, and 12th inst., 588 schools contended. When the awards were made, the greatest number appeared for the Orphan Working School, Haverstock-hill. This establishment entered the lists for the first time, and sent up 161 boys, 71 of whom had their drawings marked excellent, 39 were adjudged proficient, 39 were considered fair, and 12 were passed over.

Mr. John Absolon has painted and presented to the governors of Guy's Hospital ten large sketches in distemper, which are intended to be hung in the convalescent wards of the hospital. The pictures are illustrative of the pleasures of labour, and are now on view at the Institute of Painters in Water Colours, Pall Mall. The proceeds of the exhibition, it may be added, are to be devoted to the relief of the patients of the hospital.

The arrangement of the third and final collection of the National Portrait Exhibition is now making good progress at South Kensington. There is no want of portraits: indeed the great difficulty is to find space for those already received. The exhibition will consist of portraits of eminent persons who have lived during the present century, and of many distinguished people who flourished prior to that time, forming a supplement to the whole series. In all there will be about 900 portraits, and efforts are being made to open the exhibition, which promises to be of greater popular interest than its predecessors on Easter Monday.

A curious interesting discovery is reported from North Stonington, Connecticut. Some time ago a lime-kiln was built with a dark reddish stone which abounds there it appears, and heating it to the temperature required the whole fabric melted as though it were lead. It has recently been discovered to be glass in a natural state. Specimens of the material were sent to a glass manufactory, and fine goblets have been made from them.

Mr. William Young, architect, suggests that the original drawing from which Dr. Barry's photograph, which serves as a frontispiece, is taken, should be sent to the forthcoming Architectural Exhibition, so that people may observe and judge for themselves. A very good suggestion.

The church building at Amherst, in the United States, for the Rev. J. L. Jenkins, is to have a pulpit built of the cedar of Lebanon, by way, as a New York paper supposes, of rivalling Mr. Beecher's new desk of olive-wood, which, it appears, was cut near the Garden of Gethsemane.

At the last meeting of the Town Council, Mr. Fulton, of Dundee, was selected from no less than 97 applicants to fill the vacant office of Borough Engineer and Town Surveyor to the borough of Newcastle, at a salary of £600 per annum.

The carpenters and joiners of the Manchester district have been directing their efforts towards the formation of a school for technical instruction in mensuration, drawing, elementary geometry, mechanics, stair construction, and other trade matters. A public meeting of those interested in this movement is to be held early in April, at the Hulme Townhall, at which the Mayor of Manchester is to preside.

Well may it be said that one half of mankind does not know how the other half lives. For illustrations of this statement let us refer to some facts mentioned by the Archbishop of York in a speech made by him before the president of the Poor Law Board on Saturday last. The right reverend gentlemen, quoting from the official inspectors of the Chesterfield Union, said that some of the beds in the infirmary are so near together as almost to touch, the rain drops through the ventilators in the ceiling on to the floor, and, in one instance, on to the bed. In one ward seven dirty and neglected children were found eating their dinners on the floor; the medicines are handed over to the patients themselves, who take them or not as they are inclined; there are no proper means of washing the sick, and only one towel a week is allowed for use in each ward. In the same infirmary an imbecile patient was lately beaten to death by a pauper wardsman for some trifling act of negligence. In the Shardlow Union there is no classification even of the sexes; at Ashton-under-Lyne the convalescent sick share the lunatic day-room, confinements take place in the general sick wards, and the fever wards are used for itch and other disgusting diseases. This state of things is more or less common to the Blackburn, Burnley, Bury, Chorley, Clitheroe, the Fylde, Haslingden, Oldham, and Preston workhouses. His Grace recommended that the reforms which have been made in the management of the London workhouses should be extended to those in the provinces.

The *City Press* records the death of Mr. John Mowlem, the senior partner in the firm of Mowlem, Burt, and Freeman, the well-known granite merchants and contractors. Mr. Mowlem's success in life is an instance of what may be achieved by industry, perseverance, and integrity. At the early age of seventeen he started from his native village of Swanage, in Dorsetshire, with his workman's tools upon his shoulder, to seek his fortune in the world. He soon found employment as a journeyman mason at East Cowes Castle, which was at that time in course of erection by Nash, the architect. Shortly after this he came to London, where he made another advance in his career, by being appointed foreman of the extensive works ordered by the Government to be carried out by Mr. Henry Westmacott, the statuary and mason, in which he gained considerable experience, and the confidence of all with whom he came into contact. Not long afterwards he commenced business as a stone merchant in Grosvenor-basin, Pimlico, passing through many struggles, borne with indomitable courage and perseverance, in order that he might rise to a position, and in which he ultimately succeeded, as in the year 1839 he obtained a contract with the City authorities to pave Blackfriars Bridge, in which work the description of paving-stone technically termed in the trade "narrow-cubes" was first used, and which has since become the principal paving in the London thoroughfares. In 1844 he rewarded his two assistants, Mr. Joseph Freeman and Mr. George Burt, by taking them into partnership, and upon them for the last fifteen years the care of the business has devolved, and who now succeed him. Mr. Mowlem was a citizen and liveryman of London. He died in the 80th year of his age, "a self made man," and the friend and benefactor of his fellows.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

2253 G. W. DINSDALE. IMPROVEMENTS IN THE CONSTRUCTION AND MANUFACTURE OF TRAPS FOR WATER-CLOSETS, DRAINS, AND OTHER PURPOSES. Dated August 3, 1867.

The patentee claims, first, the construction of D or similarly shaped traps in two parts, the dip or inlet pipe being either formed as part of the shell or body, or in combination with the cover of the trap, as described. He also claims the construction of D or similarly shaped traps of earthenware in one or two parts, as described. Second, he claims the manufacture of D or similarly shaped traps by casting them complete in moulds with the dip and inlet pipe and outlet passage forming part thereof, the top or cover being cast or formed therewith, or separately therefrom, or in combination with the top or cover, as described. —Patent completed.

2273 F. RYLAND. IMPROVEMENTS IN PULLEYS FOR SUSPENDING WINDOW FRAMES, AND FOR OTHER LIKE PURPOSES. Dated August 6, 1867.

This invention consists of improvements in that part of pulleys for suspending window frames, &c., called the mortice plate. The patentee makes the mortice plate with semicircular ends, and he makes in the centres of the semicircular ends the holes through which the screws are passed to secure the mortice plate in the mortice of the window frame or other article. He also makes the opening in the mortice plate in which the bowl or wheel of the pulley works with semicircular ends.—Patent completed.

Trade News.

TENDERS.

The erection of St. Bartholomew's Church, Ruswarp, near Whitby, has been let to Mr. Robinson, of Whitby, builder, whose tender, £1,846 16s., was the lowest.

HANWELL.—For new building in Uxbridge road, Hanwell, for Baroness Wild. E. Welby Pugin, architect:—

Hill and Son	£2,400
J. B. Hodgson	2,355
J. Kelley	2,330

HORNSEY.—For the erection of a pair of semi-detached villas, at Hornsey. Mr. J. W. Reed, architect:—

Staines and Son	£2,988
Keys	2,987
Ebbage	2,900
King	2,873
Sale	2,827
Garrad	2,768
Hume	2,725
Carter and Sons	2,647
West	2,634
Russell (accepted)	2,445
Hunt and Elkington	1,965

KENSAL GREEN.—For an Oratory, Kensal Green, for Baroness Wild.

Hill and Son	£350
J. B. Hodgson	290

LONDON.—For new warehouse, No. 19, Basinghall-street, City, E.C. Mr. Herbert Ford, architect:—

Turner and Sons	£4133
Brass	4046
Piper and Wheeler	3877
Mann	3875
Crabb and Vaughan	3839
Brown and Robinson	3815
Pritchard	3740
Henshaw	3614

NEW MALDEN (SURREY).—For the erection of Five Pairs of Semi-detached Residences. Mr. W. Sim, architect:—

Kelley	£5,850
Brown and Robinson	£1183
Piper and Wheeler	1176
Brass	1127
Webb and Sons	1060
Hill and Keddell	990
Rivett	948
King and Sons	845
Crabb and Vaughan	728

LONDON.—For erecting two warehouses, Trinity-court, Aldersgate-street, City. Mr. John Collier, architect. Quantities supplied by Mr. J. S. Lee:—

Wilson (too late)	£5,999
Rogers and Richards	5,190
Axford	4,985
Carter and Sons	4,948
Nightingale	4,943
Keyes	4 793
Gammon and Sons	4,717
Scrivener and White	4,612
Deards	4,585
Langmead and Way	4,492
Crabb and Vaughan	4,474
Wood	4,389
Sharpington and Cole	4,339
Foale	4,035
Henshaw (accepted)	3,967

LONDON.—For the erection of warehouse, Whitecross-street. Mr. T. C. Clarke, architect:—

Killby	£1782
Turner and Sons	1772
Conder	1695
King and Sons	1690
Abraham	1635
Mortar	1627
Webb and Sons	1596
Kelley	1572
Scrivener and White	1476
Henshaw	1439

MANCHESTER.—The following are lists of the tenders delivered for the Grand Stand, Second-class Stands, Stabling for eighty horses, Fencing, Approaches, &c., for the Manchester Race-course Company Limited. Messrs. Thomas Bird and Son are the architects. Quantities were supplied:—

GRAND STAND.

Cochrane, Parker, and Co.	£6,957
Terras	6,628
Greenup and Co	6,400
Thompson	6,234
Neill and Sons	6,215
Warburton, Brothers	5,850
Johnson (accepted)	5,489

SECOND CLASS STANDS.

Cochrane, Parker, and Co.	5,073
Terras	4,856
Thompson	4,735
Greenup and Co	4,700
Neill and Sons	4,594
Warburton, Brothers	4,320
Johnson (accepted)	4,053

STABLING, FENCING, &c.

Cochrane, Parker, and Co.	5,150
Terras	5,084
Warburton, Brothers	5,020
Thompson	5,000
Greenup and Co	4,960
Johnson (accepted)	4,940

NORWICH.—For the Drainage. Contracts Nos. 5, 6, 7, and 8:—

Turner and Sawyer	£51,887 (!)
Elliott	51,552
Pickering	48,239
Dover	46,855
Hewitson and Yaxhall	46,542
Bennett	45,757
Moulson and Co	40,059
Thirst and Co	32,804
Plews	32,483
Morton and Sons	31,183
Floyd	30,579
Wainwright	29,500
Shrimpton and Co	28,874 (!)

SUSSEX.—For alterations and additions to the Sussex County Prison. Mr. Henry Card, County Surveyor:—

Perigoe	£16,154	S	6
Nutt and Co.	14,400	0	0
Williams	13,378	6	2
Patman and Fotheringham	13,285	0	0
Henshaw	12,778	0	0
Hughes	12,569	0	0
Nightingale	12,352	0	0
Berry	12,110	0	0
Kirk	11,990	0	0
Exton and Chapman	11,950	0	0*
Howell	11,715	0	0
Hall	11,445	0	0
Cheeseman and Co.	10,900	0	0
Chappell	10,690	0	0
Perry, jun.	10,444	0	0

* The omitted tender was from Messrs. Lansdowne's quantities.

WANDSWORTH.—For Plough Brewery, Wandsworth-road. Mr. Charles J. Shoppee, architect. Quantities supplied by Mr. Sidney Young:—

Macey	£5,989
Hart	5,949
Patman and Fotheringham	5,792
Mansfield, Price, and Co	5,742
Adamson and Son	5,695
Myers and Sons	5,589
Brass	5 547
Jackson and Shaw	5,300

THE BUILDING NEWS.

LONDON, FRIDAY, APRIL 3, 1868.

CAN FRESCO-PAINTING BE ACCLIMATIZED IN ENGLAND?

WHEN the decoration of the Houses of Parliament was under consideration more than a quarter of a century ago, it was intended that the paintings and other embellishments should be carried out in such a manner as to communicate a new impulse to our school of art. It was considered that an opportunity was presented of which advantage should be taken to elevate the public taste. Historical painting (so-called), presumed to be the leading feature of other schools, had been fostered by foreign governments; but, to English painters no such support had ever been afforded. A competition of cartoons was invited in Westminster Hall. The arena was open to all comers, and the walls were covered with large drawings executed according to the prescriptions set forth. But among the competitors there were many whose attention had never been engaged by anything beyond a water-colour drawing, or a small oil picture; and hence were painfully conspicuous all the defaults that attend a sudden transition from *genre* to history. About two years afterwards, an exhibition of large paintings in oil was held also in Westminster Hall, of which only three or four were considered worthy of acquisition by the Government. These were a "Death of King Richard the First," the "Burial of Harold," a "Battle of Trafalgar," and perhaps another. These works are never seen by the public—they are hung in one of the larger Court Rooms. Thus the available produce of these exhibitions may be said to be nothing, and the impetus expected to have been given to what is called high art was a miserable failure. This, however, was not the fault either of the Government or the painters. The former was ignorant of the course of preparation necessary to lead up to first-class mural painting, and the latter were led into error by an overweening confidence.

The first experiments in fresco were made in an upper waiting-room adjoining one of the corridors which leads to a series of committee rooms. Here it was determined that eight frescoes should be painted, the subjects to be chosen from the verse of Chaucer, Spenser, Shakspeare, Milton, Dryden, Pope, Scott, and Byron. The resolution was rashly made and hastily carried out. It may seem easy to point out errors and shortcomings in a retrospect, when everything is patent to inspection, but had any inquiry been made as to the suitability of our climate for fresco, the walls themselves (of the Poet's Hall) would have given a very decided answer in the negative, for during the winter they periodically stream with water.

It is now more than twenty years since the series was completed, and many of them now hang in rags; indeed, had they remained in the most perfect preservation, there are some which it would have been desirable to have removed, as deficient in quality for the ornamentation of the Houses of Parliament. Mr. Watts's picture was the first to show signs of decay, and now it presents, in some places, the appearance of having been scraped by an iron instrument. The first indication of dissolution is the discolouration in patches of the deeper passages of colour, showing under a microscope a luxuriant crop of fungi. As a rule, the destruction seems to have advanced from the dark tones to the middle and high lights. That is, throughout the series the lowest degrees of the scale exhibit the readiest tendency to decay, while the middle tones and the highest lights, as in Horsley's subject from Milton, and Armitage's picture, remain sound, and so on generally of all the upper tones of the scale which contained any considerable proportion of lime, or consisted of it almost entirely. Certainly in manipulation, and probably in the colours employed, no two of these pictures were worked in the same manner. It may be observed here that the oxides which were safely used in Italy could not be employed in England without risk of failure, and the reasons are obvious. The pallette in use among the early Italian fresco painters was necessarily limited and simple; and on this fact has been based an argument in favour of the stability of such works as those by Benozzo Gozzoli, in the Campo Santo, at Pisa, and the subjects in the Spanish Chapel in the Church of Santa Maria Novella, at Florence, painted by Memmi. These frescoes have stood for centuries, and what signs soever of decay they may show are not attributable to any failing of the means employed in the art, but to that of the surface on which the pictures have been executed. The subjects, by Mr. Watts, from Spenser—being, in fact, St. George and the Dragon—is professed to have been worked strictly according to the principles of the Florentine masters. But, curiously enough, this picture was the first to blister off, and the corruption of the paint surface declared itself soon after the panel had been finished.

When Dyce painted those beautiful frescoes that adorn the east end of the church in Margaret-street, he began his work after having had considerable practice in the art, and with all the benefit derivable from the experiments in the Poet's Hall. But these paintings also became discoloured, and their surfaces began to break up, insomuch as to render necessary extensive reparation by Mr. Armitage, who, we believe, expressed the utmost confidence in the permanence of his emendations, and also of those portions of Dyce's work which had escaped injury. Not having examined these decorations very recently we are not prepared to report their present condition.

The only picture in the Poet's Hall that shows no conspicuous marks of decay is Tenniel's "St. Cecilia;" all the others are more or less injured, and especially those on walls of which the outer side is exposed to the weather. In Herbert's magnificent picture, the "Disinheritance of Cordelia," the faces of Goneril and Regan were the first to yield. These, we believe, the artist has restored, but the mischief is spreading, and will extend to the entire panel. In Cope's "Death of Lara" some of the lower flesh tints remain sound; whereas, in others, these are the first to become discoloured. In Guiselda's "First Trial" there is extensive discolouration, but the reds and flesh tints yet remain clear; and similar observations will apply to the other panels. This alteration—that is, the destruction of the flesh tints in one picture, and their preservation in another—is evidence enough that no two of the subjects were worked in the same way. Throughout the series the lightest passages are those that have generally escaped injury. Thus, the white wings of the angels in Horsley's subject from Milton, and the plumage of the swan in Armitage's "English Rivers," remain in perfect condition. Descending from these, the highest toned draperies—pinks, light greens, and all colours largely diluted with what we may assume to be lime white—have also resisted change. But in the more intense passages, and especially those that have been retouched in *secco*—that is, hatched and stippled after the first painting has been allowed to dry—the mischief is most apparent.

An impression is prevalent, not only among the professors of the art, but also among those who would be its patrons, that fresco can be acclimatized in England, and hence the destruction of these works has been attributed to many causes, but not to the true one. The source of the mischief has been sought in different directions, and inquiry has been pushed even to the regions of abstruse science, to explain an enigma the solution of which was overlooked only in consequence of its extreme simplicity. There are, in a small temporary wooden erection at the western extremity of the Houses of Parliament, three pictures by Mr. Ward, ready to be fixed in the corridor of the House of Commons. These complete the series of eight. It is not, perhaps, generally known that the works in the corridors of both Houses are not painted on the wall, but on large slabs of slate faced, in the case of fresco, with the usual wet lime intonaco; but, for the water-glass method, with a preparation of lime, which is allowed to dry before being worked upon. All these pictures are placed in the wall in such a manner as to admit of a circulation of air behind the panel, an arrangement which is equivalent to a declaration that damp is believed to be the cause of the destruction of the paintings in the Poet's Hall.

We have mentioned the water-glass method of mural painting—that in which the works of Wilhelm Kaulbach are painted in the new museum at Berlin, and which has in Germany been regarded as an admirable substitute for fresco. Water-glass or stereochrome painting is simply water-painting in body colours, fixed afterwards with a chemical compound. Hence it will be seen that all the methods of enrichment available in water-colour painting may be used with effect in stereochrome, such as repeated paintings, stippling, hatching, and even glazing. When the picture is completed and perfectly dry, it is wetted with a solution of quartz powder and purified potash, to which is added a small proportion of a caustic alkali. This, in the actual fixing, is generally diluted with a proportion, equal to one-fourth, of water.

Herbert's grand picture, "Moses bringing down the Tables of the Law," in the Peers' Robing Room, is a water-glass picture; so also are Maclise's two great works in the Royal Gallery, "The Death of Nelson," and "The Meeting of Wellington and Blücher after the Battle of Waterloo." Both in the Royal Gallery and in the corridors half of the panels by Cope and Ward are in stereochrome. These water-glass pictures are of comparatively recent execution, yet Mr. Ward has found it necessary to repaint large portions of some of his works, discolouration having set in and advanced so rapidly as to threaten destruction to the entire surface. But here the first indication of decay is a white efflorescence which cannot be removed even by a wet sponge, and by this the colour is entirely superseded. What the ultimate effect might be is not known, the advance of the mischief having been arrested.

Many persons, with a little knowledge of fresco painting, but of no knowledge of the conditions under which these works were executed, argue that the lime of which the intonaco was prepared, was not sufficiently matured. The ordinary method of preparing the lime is to slake it, and leave it covered with water to ripen. It will not be safe to use it under three months. None of the frescoes in the Poet's Hall were painted on lime which had been less than six months under preparation; and now there is a large stock of lime in the cellars of the House of Commons that has been in a state of preparation for more than twenty years. If those artists who have had most practice in fresco painting be asked why they tried stereochrome, they will answer simply that their experience had taught them that fresco was not suited to our climate.

For the decoration of large buildings fresco recommends itself by its qualities of grandeur and breadth, but such is the delicacy of the painted surface that it will be liable to destruction in any other than in an equal and moderately high temperature, a condition which in our ordinary public edifices it would be difficult to observe. As a means of common domestic ornamentation it might be permanent, for the temperature of a drawing-

room or a dining-room would be favourable to its prolonged existence; but it is to be feared that in such a situation the means and manner of the art would importune the eye to the prejudice of the subject. There needs no lengthened inquiry to tell us that the works in the Poet's Hall have been destroyed by damp, and those in the corridors have been injured by the gas. For the latter a corrective is on its trial, but in the meantime all the evidence that we are able to collect on the subject leads to the conclusion that fresco refuses to be acclimatized in England.

ASYLUM FOR IMBECILES, CATERHAM.

A POWERFUL and well directed effort is at present being made by the managers of the Metropolitan Asylum District to provide accommodation of the best kind for the insane and imbecile. Vast establishments like Colney Hatch and Hanwell have long been acknowledged by medical authorities not to be so well suited for the treatment of the insane as those of moderate size. Ground has therefore been purchased at Leavesden, Caterham, and elsewhere, by the managers of the Metropolitan Asylum District, and competitions have been invited. In both Leavesden and Caterham competitions Messrs. Giles and Biven have been successful; the Leavesden plan having, in the opinion of the committee, such merits that they have adopted it for the Caterham Asylum. The list of competitors, ten in number, includes the following names: Mr. Henry Jarvis, who estimates the cost of his design at £76,500; Mr. Thomas Worthington, £89,000; Mr. Chambers, £80,600; Mr. F. H. Pownall, £75,100; Mr. William Lee, £83,000; Messrs. Tolley and Dale, £61,000; Mr. Thomas E. Knightley, £75,000; Mr. M. P. Manning, £90,000; Mr. A. Wilson, £78,000; Messrs. Giles and Biven, £66,700. The drawings were exhibited to the managers on the 20th at the Westminster Palace Hotel, when the first prize of £250 was awarded to Messrs Giles and Biven, the second of £150 to Mr. F. H. Pownall, and the third of £100 to Mr. A. Wilson. The competition was limited. As the committee have selected the Leavesden plan for the Caterham site, and have forwarded it to the Poor Law Board for approval, with slight modifications, we may presume that the plan will be adopted. What chiefly struck us in these designs was the immense number of windows in the day rooms. They are lighted on three sides, and contain no less than thirty-three windows, the room being 105ft. by 36ft. The plan is on what is called the Pavilion system, connected by a corridor on the ground-floor only. Of the necessity for a corridor on the second floor, the committee must be the best judges. Mr. Wilson has provided a second corridor. The designs all show three storeys, and the arrangement is very similar in all. It has always seemed to us that hospital or asylum work was very easy—the instructions are so precise, the hygienic requirements so thoroughly ascertained, so many similar institutions may be drawn upon, with the advantage of the comments of the resident officers, who know the advantages and deficiencies of the building. Besides all this little variety is permissible, and, as a single compartment or pavilion is all that requires designing, with the exception of the administrative department, we should have thought that most architects could produce a very good design, or at all events a decent elevation. This, however, is far from being the case, and whatever may be the merits of the plans, the elevations of the Caterham Asylum are as ingeniously bad as they could well be. Where extreme simplicity is imperative, we are aware that no large amount of architectural display can be expected, but there might be some proportion between wall space and openings, and the latter might be in the proper places. There can be no possible excuse for placing four lights in pairs at the end of the day rooms. Externally they are hideous, internally they are inconvenient. The room has, besides, twenty-nine windows opening to the outer air, and three or four opening to the stairs. This defect might so easily be remedied that we hope it will not be overlooked by the Poor Law Board. The material is yellow brick, with the usual bands of red. The way in which the drawings are got up is worthy of remark, the different parts being distinguished by colours. The male wards are coloured red, the female yellow, steward and male attendants' neutral tint, matron's and female attendants' green, and so on, so that the most inexperienced can see at a glance what portion of the buildings are devoted to any special purpose. It would be well if all competitors adopted this system. Of Mr. Pownall's plan little need be said; it is certainly not distinguished by any special merit, while the elevations are remarkable for an utter absence of anything like design. The windows are ill proportioned, the dormers being particularly bad. This design is the most ambitious of the three which have obtained premiums, but it is undeniably the worst. The material is red brick, and the style Italian, with cornices, strings, keystones, and the like of a light colour. This design is not one we should have thought of finding among the successful in a limited competition, or indeed in any other. The third set of drawings by Mr. Wilson is in arrangement very like the others; the corridors are, however, extended to two storeys. The style is Italian, and the arrangement is picturesque. The system of presenting gables to the view is not true Italian architecture. In the humble one-storey cottage the simple low-pitched roof is seen without cornice, but in buildings of any pretensions a cornice is necessary to form a tympanum. In Mr. Wilson's design this could easily be corrected. Mr. Pownall and Mr. Wilson obtained the second and third premiums respectively in the Leavesden competition. They ought by this time to know to a nicety the requirements of these institutions, and we hope if they again compete they will take in good part the remarks we have felt called upon to make regarding their elevations. In the cases of all three competitors there is not only room for improvement in the elevations, but a very real and urgent necessity for it. At present they do not promise to raise the somewhat low estimation in which architects are, we fear, held by the public. The other designs we did not see, and therefore cannot speak of their merits.

CONCILIATION.

WE are not about to write an essay on the propriety of submitting the Alabama dispute to the arbitrament of some statesman or potentate who may, by mutual accord, be selected for the purpose. All will admit that arbitration, if it can be practically applied, is a better method to settle disputes than war. And, if it be applicable to international matters, we see no reason why it may not be resorted to in order to prevent strikes, which are, to all intents and purposes, a species of war between employer and employed. There can be no doubt that strikes have been productive of incalculable loss and suffering, not only to those directly interested in them, but to the whole community. Mr. A. J. Mundella, of Nottingham, in the very able lecture he delivered at St. James's Hall a few weeks since, said that an intelligent leader and secretary of a trades'-union supplied him with a list of ten strikes, which cost the men alone upwards of a million sterling. But the loss of a million of pounds is, after all, but a comparatively small portion wasted in this way. In proof of this Mr. Mundella referred to the Sheffield file strike of last year, in which 3,000 or 4,000 who were directly concerned affected nearly 15,000 persons, causing much loss of wages to the men, and commission to the masters, and trade to the town, and left the men and the masters heavily in debt. The lecturer went on to say, "Consider what must be the condition of the homes of these men after all this; consider what a protracted struggle for them to regain their former comfort; consider, moreover, the hatred, malice, and uncharitableness that such a strike must engender. Is it surprising that, from the frequent recurrence of such scenes as these, we reap a harvest of conspiracy, intimidation, outrage, and crime?" The unseen results of a war are far more disastrous and enduring than the results which are seen and estimated. Strikes, and the spirit from which they spring, tend, by their turbulent action, to weaken the commercial life of the nation. This country has suffered more from their frequent occurrence than any other. The questions, then, that naturally arise are, what causes them, and how can they be prevented? Some employers fasten all the blame on the men, and the men, or a large proportion of them, return the compliment, and put the fault on the masters, and the consequence is a strong and ceaseless antagonism between Capital and Labour.

A glance below the surface will satisfy any unbiassed and intelligent person that neither master nor men are altogether in the wrong. Both parties have been influenced by a similar spirit; both have endeavoured to get as much as they could, without a very scrupulous regard to the means used to obtain it. On the one hand, we may have seen many, who, though at one time working men themselves, when they obtained the power, used it with merciless rigour. Vulgar, purse-proud, and exacting, they have regarded labour as a marketable commodity and nothing more, and the labourer as a machine, without being invested with any moral quality. On the other hand, we have seen the men sullen, dogged, and equally exacting, and, to make matters worse, we have seen these men enter into a combination to enforce, by organized effort, what they could not effect by individual action. Hence strikes. Combinations of the men have been met by combinations of the masters, and lock-outs have been resorted to as a counterpoise to strikes. There have been faults on both sides, and the fault not only rests on both, but it must be distributed over the community at large. The spirit of our commercial civilization is competitive. It cannot be denied that an all-absorbing spirit of selfishness has long since taken possession of a vast majority of our citizens. Men, in their eager haste to "get on," have disregarded the claims of their neighbours. In spite of what the Church, philosophy, and art have taught, this has been, and is, the prevailing spirit of the times. It is, therefore, idle for labour to put all the fault on capital, or capital to father all the fault of strikes on labour. It would be equally idle to put all the fault on both, as the whole community is more or less answerable for the results. The individual has been hurried on by the multitude, and all have, more or less, suffered. But we think we see the dawning of better times. There are not wanting indications that influential members of all classes are beginning to see that mistakes have been made, and that remedies may be applied. If, however, a better state of things is to be brought about, it can only be done by mutual concession. The employer must yield something, and the employed must follow his example. Hence the necessity for courts of conciliation and arbitration. These courts have, for many years past, worked well in France, and we see no reason why they should not be equally applicable to England. In fact, the experiment has been made in Nottingham with triumphant success. It is rather curious that certain towns in the kingdom have made a name, and have become historical, by devoting themselves to special movements. The mighty struggle that preceded the Reform Bill of 1832 derived its central

strength from Birmingham. The progunostications of men, who saw a little in the distance the pillars of the constitution crumbling before the touch of Reformers, remain unfulfilled. The equally great struggle which stirred the moral forces of the nation preparatory to the abolition of the Corn Laws and the destruction of the principle of monopoly in commerce received its inspiration from Manchester. Rochdale has already made itself a name for the practical attention it has given to the experiment of co-operation—an experiment which bids fair to introduce a vastly greater change in the social condition of the people of England than what has been, or what is likely to be, effected by the Reform Bill and free trade combined. And now we see another town—Nottingham—in which another movement, big with moral consequences, has commenced. Possibly many of the inhabitants of that town are not aware of the importance of the arbitration idea that, for seven years past, has produced in their midst such signal results; possibly they are not aware that they have in Mr. Mundella the man who is likely to make the name of their town renowned throughout the British Empire. Some of us in the distance who see with unprejudiced eyes, and who are ever ready to herald any messenger whose voice brings glad tidings, see in Mr. Mundella such a man. For years he has presided over a board of arbitration in Nottingham, which has prevented strikes, adjusted the claims of master and man, calmed turbulent passions, and produced general satisfaction. Previous to the institution of this board Nottingham was notorious for its frequent strikes, and for the social disturbances they produced. It had deservedly won an unenviable name for frame-breaking, and outrages against person and property. "The story," says Mr. Mundella, "of the relations existing between masters and workmen for a period of 150 years before the formation of our local board, is a history of contention, lawlessness, and crime." When the board was formed cynical people might have asked, "Can any good come out of Nazareth?" During the last seven years a change has come over the spirit of the place, a change that has already manifested itself in the improved appearance of the people in their social relationships and domestic habits. This change has been brought about by a strong and irrepressible desire on the part of a few men to do something like justice. These men, and particularly Mr. Mundella, have said by their acts to the working men, "Come, let us confer together. Let us talk over our mutual differences, and see whether there is not some other way of settling them than by angry words and angrier strife. Let us consider disputed matters, not as members of antagonistic classes, but as men; not as if our interests were necessarily hostile, but as if they were necessarily interdependent. Let us, in fact, negotiate on equal terms, in a forbearing spirit, and endeavour to buy and sell labour in a way most likely to promote the prosperity of all." Both parties have acted in this spirit, and both have participated in the results. What is good and applicable to the lace-workers of Nottingham, is good and applicable to the saw-grinders of Sheffield, the cotton-spinners of Manchester, the shoemakers of Northampton, or the building trades throughout the country. But to obtain results similar to those at Nottingham, the Nottingham spirit must be emulated, and the Nottingham example followed. A change is demanded by the exigencies of our commercial position, the new political relationships into which we are about to enter, and the social harmony of the country.

Perhaps the building trades have suffered more from strikes and their inevitable retinue of evil than any other trades. As a rule architects and contractors have spoken more bitterly against the men than any other class of employers. One can scarcely speak to an architect or a builder on the subject, but that he gets reminded of some instance where the men have refused to work on account of some absurd regulation, or possibly resorted to violence to obtain their ends. We have no disposition to screen the men. They have frequently acted unreasonably, unjustly, and cruelly. Have not contractors also sometimes acted despotically? Have they not sometimes treated, we may say looked down upon, the men with a kind of contemptuous regard? Our duty, however, at present is not to particularize faults or to administer blame, but rather to promote a plan whereby the sufferings of generations may be allayed. Goethe said that immediately you begin to thoroughly understand a thing you begin to love it. Let the masters consider themselves as if they were men; let them think that the men have to work, work, work, day after day, and year after year, for 6d., 7d., or 8d. an hour, as the case may be; that the vast majority have so worked since they were children, and will only discontinue to work when they discontinue to live. Let the men, on the other hand, put themselves in imagination in the place of the contractors; let them consider the calculations for tenders, the brainwork that is necessary, the ceaseless anxiety to get the work done, and to get money to pay wages, and the frequent loss a contract entails. Let both parties regard each other respectively in this way, and they will learn to respect and probably to sympathize with each other. If the strike system is to be abolished, and we feel sure it may, this is the way to approach the subject. It would be useless to attempt arbitration as a permanent mode of settling disputes without conciliation. Let the spirit exist, and the mode of action will soon follow. The mode adopted at Nottingham is very simple. Nine representatives are elected by the members of the trades'-unions, and nine representatives are elected by the manufacturers, and these men meet periodically, discuss matters in a friendly way, and determine the prices which shall be paid for different kinds of work. Though thousands of kinds of articles are produced, the price paid for the production of each is fixed by the board; and, strange to say, for three years and a half the board have arrived at their decisions without even voting. When a question has been fully discussed, and the members of the board have not found themselves unanimous, they have said, "Don't let us vote, let us try to agree;" and by mutual concession they have never left a meeting without having first agreed. The Nottingham board now governs the hosiery trade of Nottinghamshire, Derbyshire, and the north of Leicestershire; and the number of persons employed in these districts cannot be less than 60,000 persons. Now, if a principle can be applied where such a vast variety of articles are produced, and where the minutest calculations are necessary, it can, if the desire exists, be applied with comparative ease to all the building trades, where the machinery of production is less complicated. Where there is a will there is a way. The first thing required is the disposition, the disposition will bring the will, and the will make the way. There may be difficulties to overcome and prejudices to undermine before the end be obtained; but surmounting difficulties is only a healthful educational exercise. Conquerable difficulties are rather to be courted than shunned, as the task of destroying them involves a moral discipline which sweetens labour, and brings its own reward. The first thing necessary is the right attitude of mind. Around the Nottingham board hovers the spirit of perfect equality. The manufacturer feels that he is conferring no favour on the workmen by sitting with them, and the workmen's representative feels under no obligation to the manufacturer for his presence. They both meet in a common spirit for a common object, and they have so far shown a splendid moral example to the world. They have already done a work which has not only prevented strikes and brought social sunshine on their community, but they have contributed an important fact to the history of industrial development, and given mankind, as far as their seven years' experience goes, a guarantee of future peace. Lord Monboddo, judging from the past history of the world, said that war was the natural state of man, and any one acquainted with the spirit and aspects of our much-vaunted material civilization for the last fifty years might suppose that strikes were the natural offspring of our commercial activity. The Nottingham experiment has so far dispelled the illusion, and taught us that, if men will only meet each other in a respectful manner, listen to each other's claims, and act justly, contention may be prevented, and some of the waste places of the world may be made to blossom as the rose.

J. Passmore Edwards.

ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of the Architectural Association was held on Friday last, Mr. R. Phené Spiers, the president, in the chair. The minutes of the last two meetings were duly read and confirmed.

Messrs. A. W. Watson, H. Powell, E. Grant, E. Williams, G. B. Smithers, E. A. Browning, E. R. Walker, and G. B. Wilson were duly elected members of the association. Messrs. W. E. Bale, F. J. Holman, H. Blackburn, R. E. Farnall, Chas. Birch, Lyon, and Abbott, were nominated for election at the next meeting.

A letter from Mr. Blashill was read, in which, regretting his inability to be present, he wished to bring before the members the great value of Sir William Burnett's process of preserving timber. He was at present engaged in some work where the woodwork was very greatly exposed to damp, and he had found the Burnettising process most valuable, and therefore wished to commend it to his brother members.

Sir Henry Dryden said he had been asked to state his opinion to the meeting of Burnett's Patent Process for Preserving Wood. He had used the process for about twenty years and could testify to its very great utility, especially with inferior woods exposed to the weather, as gates, posts, and rails of ash and elm. He had also tested elm in cellars, preserved and unpreserved, with the same result. There were two or three modes of doing the work, not all equally effective.

Sir Henry Dryden, Hon. Mem. Soc. Ant. Scot., then read a paper on "The Ruined Churches of Orkney and Shetland," of which the following is an abstract:—There were, said Sir Henry, with regard to ancient churches of all kinds, four classes of persons with as many different opinions of ancient churches. There were Churchmen, who cared little about the antiquity of a building or any archæological or historical interest attached to it—all they asked for was that it might be rendered fit for public worship. Next, there were the artists, lovers of the beautiful, who, disregarding all other considerations, wished for beauty and high art. Then we had to encounter the antiquarians, who accounted it sacrilege to touch a stone of one of these buildings, regarding them, so to speak, as pages of the history of the country; and, finally, there were those, of whom he was one, who, while wishing to restore and fit for use these venerable relics, yet held in tender reverence their historical associations and their great value as relics of past ages.

The ruined churches of Orkney and Shetland were especially valuable. They were links in the series of places of worship which began with cottages and caverns, and culminated in the cathedrals of the thirteenth and fourteenth centuries. In England, owing to a dense population, the first churches have been supplanted by larger ones, in most instances, so that these northern buildings had no existing equivalents unless in Cornwall. This alone gave them a great value. Unfortunately from the Reformation to the present day the custom has been for the owners of these buildings to destroy or mutilate them, or to permit them to be so treated, and within the last twenty years considerable decay and demolition had taken place. Frequently a bushel of lime and a mason's labour

for a day would preserve a building for many years, but the trifling cost is grudged, and the structure falls. The churches and chapels of Orkney which he intended to describe were St. Ola's, or St. Olave's, in Kirkwall; Orphir; Brough of Deerness; Brough of Birsey; Wyre; Enhallow; Linton, in Shapinsay; and Egilsey.

The churches of Shetland which would be described were Culbinsbrough, Noss, The Ness in North Yell, and Uya. The others, of which he had plans and notes, were not of sufficient importance to describe to the meeting.

The group of the Orkneys is about 60 miles N. and S. by 30 E. and W. It is separated from the north point of the mainland of Scotland by about 12 miles of sea. It contains 27 inhabited islands of about 30,000 people. The group of the Shetlands is about 100 miles farther N. and E., and is about 70 miles N. and S. by 54 E. and W. It contains 25 inhabited islands of about 30,000 people. Orkney and Shetland were not attached to Scotland till 1468.

St. Ola's Church stands about W. by S. and E. by N. It consists of one parallelogram 35ft. by 18ft. inside. The south side abuts on a lane, and a house is attached to the west end, from which house into the chapel a modern doorway has been cut. The south wall is 2ft. 11in. thick, the west wall, 3ft. 6in. The original entrance is on the south, 17ft. from the exterior west angle. It is 3ft. 5in. wide, with a semicircular head, and continuous mouldings of a hollow, ornamented with four-leaved flowers and a filletted roll. The original height of the side walls is not now evident. They are now about 20ft. above the original floor, probably the ridge was about 24ft. high. The east end has no trace of an original window, but a modern one has been inserted. In the south wall near the east angle is a modern window, probably in the place of an original one. The other original windows cannot be traced. A few feet east of the entrance was a stoup or piscina. In the north wall near the east angle remains an ambry 1ft. 4¾in. wide, 2ft. 1in. high, and 1ft. 3¼in. recessed; the head is an ogee arch under a hood moulding, and it is flanked by buttresses with finials. The bottom of this ambry is 5ft. 1in. above the original level of the floor. The moulding resembles that at the entrance, except in having no flowers. In the east wall near the south angle is a smaller ambry, also ogee headed, and less ornate, the bottom of which is 2ft. 6in. above the floor. Close by the chapel, in 1855, a stone was found, having on it sculptured in relief apparently a shield under a mitre, too defaced to be recognizable, and below the shield "Robertvs . . . . . ." and a date or letters illegible. Bishop Robert Reid held the see from 1540 to the Reformation, and, as the mouldings point to the fifteenth century, perhaps the chapel may be a late example of the style, and be assigned to him. St. Ola's was probably the parish church, and not a chapel of ease. It was probably not till after the constitution of Kirkwall as a Royal burgh that the Cathedral of St. Magnus became the parish church, and St. Ola's became merged in Kirkwall.

The church at Orphir stands near the east end of the parish church; the larger and most interesting part was destroyed before 1758, to build or enlarge the present parish church. It originally consisted of a circular nave, and apsidal chancel added to its east part. The chancel remains, but only 9ft. on each side of it of the circular nave. Fortunately, a record of its size and form remains in "Sinclair's Stat. Acc., xix., 417," quoted in "Wilson's Prehistoric Annals, 598." It is there stated, "In the churchyard are the remains of an ancient building, called the Girth-house, to which great antiquity is ascribed. It is a rotunda, 18ft. in diameter and 20ft. high, open at top, and on the east side is a vaulted concavity, where probably the altar stood, with a slit in the wall to admit the light. The curvature of the two parts of the nave wall still remaining gives an interior diameter of about 19ft. The church is built of yellow Orphir freestone. The nave walls are 3ft. 9in. thick, well built; and the entrance was probably at the west, as in the other round churches. The chancel, which is little more than the apse, is 7ft. 2in. wide, and 7ft. 9in. deep or long, with walls 2ft. 8in. thick. The arch into it is semicircular, and forms part of a plain unribbed vault, as at St. Margaret's Chapel at Edinburgh. The impost of the vault arch is 6ft. 5in. above what appears to have been the floor, and the top is consequently 10ft. 6in. high. Outside the vault was originally probably a solid stone roof, the apex of which was about 14ft. from the floor. This would make the walls of the nave to be about 15ft. high. The chancel has no buttresses. There is one window in the chancel, in the east end, 2ft. 5in. by 10½in. clear opening, with jambs splayed inward, 1ft. 8in. wide. The outer edges are chamfered, and the head semicircular. The impost is at the same level as the vault; it has a groove for glass. It is probable that this church was connected in some way with Earl Ronald, who founded St. Magnus' Cathedral in 1138, and soon after went to the Holy Land. As he needed all his money for the cathedral, the church was not built by him, but probably by one of his wealthy followers, and we may thus fix on 1090-1160 as limits of the date of its erection."

The Brough of Deerness is on the east coast of Deerness, and measures about 400ft. north and south, by 240ft. east and west. The chapel is near the centre of the brough, and is a parallelogram 24ft. 5in. by 17ft. 4in. outside. The west wall is 3ft. 2in. and the others 3ft. 11in. thick. Only about 4ft. 6in. and 5ft. in height remain above ground. It stands nearly true east and west, the west end facing a little south of west. It is built of clay slate, from 1ft. to 3ft. long, and 2in. to 7in. thick. It has only one doorway at the west end, which apparently was only 2ft. wide, the upper part is gone, but it was probably square headed with a stone lintel. The jambs are not splayed, and have no rabbet for a door, nor is there any bar hole. Apparently, there was only one window, which is at the east end. The top is gone, so it is doubtful whether it was flat or arched; one jamb is gone, and the other somewhat mutilated, but 1ft. 9in. in height of it remains. The window had a clear opening of 1ft. 3in. with jambs splayed inside to 3ft. 6in. in width. It appears to have had the outer 11in. of the jambs parallel, and to have contained glass. In the north wall, near the east end, is an ambry 2ft. 4in. wide, not less than 2ft. 4in. high (the top is gone), and 1ft. 11in. recessed. It has no traces of a door. Spread over the face of the brough are foundations of at least 18 huts. They are mostly parallelograms of about 24ft. by 12ft. outside, and the walls 2ft. 6in. and 3ft. thick. They were for the use of devotees, who used this rock as a place of pilgrimage. A strong partiality appears to have existed in early times for selecting as sites for churches and monastic establishments small islands, isolated rocks, or promontories difficult of access. Indeed, throughout Europe, and in the East, numbers of peaks difficult of access bear such buildings.

The Brough of Birsey contains about 40 acres. The chapel is about 50 yards from the shore, at a point nearest to the mainland. It consists of nave, chancel, and apse, all well defined, and apparently built at the same time. The material is grey whinstone. It stands east and west, the west end facing a little north of west. The exterior length is 57ft. and width 21ft. 3in. The west wall is 3ft. 8in. thick, the north and south walls of nave 2ft. 9in., and the wall of the apse 2ft. 4in. There were no buttresses. The only entrance is in the west end, 3ft. 8in. wide. The jambs are parallel without any chamfer, and there is no rabbet for a door, nor appearance of hinges, and original plaster remains on the jamb down to the sill, and all across it. There is no appearance of the insertion of a wooden frame. Were there doors in these doorways? if so, how were they hung? In many cottages in old times the door was an animal's hide hung across the opening, and probably this may have been the case in these unrabbetted church entrances. In the north-east and south-east corners are two circular spaces, 5ft. 6in. in diameter, the south one of which contains a freestone stair step, and the north one some broken stone. Probably both were staircases, but how high they reached, and to what they led, we can only conjecture. One or both may have led to priests' rooms over the chancel arch or chancel or nave. We cannot conceive a rood loft to have existed here. The entrance to the chancel is 4ft. 3in. wide, of which 4ft. in height of the jambs remain. There is a step of only 2in., and from that to the east end of the apse was originally flush. The low position of the altar is peculiar. The chancel is 10ft. 9in. east and west, and 10ft. 3in. inside. Only one window remains in the north wall, which has lost its lintel. In this wall, just east of the window, and lower, is a square ambry, 3ft. high by 2ft. 8in. wide, and 1ft. 11in. in recess. Its use is not evident. It may possibly have been an Easter sepulchre. It is remarkable that the floor was originally level to the end of the apse, and no elevation given to the altar, which was probably at the chord of the apse; but in later times they built a reredos which blocked off the apse, and steps appear to have been then made to the altar. From what remains of the altar it appears to have been 4ft. 1in. by 2ft. 7in. The interior of the nave is of the proportion of the *vesica piscis*. The interior of the chancel is square. This church was possibly built by Earl Therfin, in about 1100; it is, however, more probable that it was built by his second son Erlend, father of St. Magnus.

The church at Wyre stands on a flat piece of ground about the middle of the island. It has no roof, and is much filled up. It consists of chancel and nave with a door at west end, and all built at the same time. Its exterior length is 35ft. 10in., and width 18ft. 4in. It stands west by south and east by north. The nave is 19ft. 9in., by 12ft. 10in. inside. The west wall is 3ft. 2in. thick, the north and south wall about 3ft. There are only two windows, both on the south side, but only one appears original. It has a clear opening of 1ft. 10in. by 8in., with a flat head. The jambs splay inward to 2ft. 3in. in width. The jambs of the chancel arch are 3ft. thick. The chancel is 7ft. 10in., by 7ft. 2in. inside. There is one window on the south which appears to have been round-headed, and 2ft. 7in. by 11in. There is no ambry and no altar, or altar-place. The exterior length of the nave is equal to the diagonal of the square of its exterior width. The chancel is nearly square.

The church at Enhallow was converted into a cottage long ago. It is of grey whinstone. The exterior length is 52ft. 8in., and the width 23ft. 4in. It stands east and west. The nave is 20ft. 7in. by 12ft. inside. On the west of this, and entered by a round-headed arch, is a building 7ft. 9in. and 7ft. 5in. inside, without any doorway to the outside, and only one small square window to the south, perhaps not original. Its position is that of a tower, but it is not likely a tower would have been added to so small a church. The size and character of the arch into it are against the notion that it was a priest's room. If we may suppose the west arch to have been the original entrance to the church, and that the south doorway was of later date, then this building may have been a sacristy. The chancel is 12ft. 8in. by 8ft. 9in. inside, set out symmetrically with the nave. Outside the south door of nave is a square addition, now only 6ft. high, containing a radiating stair of five freestone steps. Perhaps the stair led to a priest's room or parvise over the porch, or it led to a bell turret. The general history of the church may be thus conjectured. In the eleventh or twelfth century a chapel was built of nave and chancel at the east end of the nave, and an entrance in the west end of the nave. In the fourteenth century a new chancel arch was inserted, north and south doorways made, sacristy built at the west end, and a porch and parvise made outside the south doorway. At later dates other additions were made.

The chapel at Linton, in Shapinsay, closely resembles in size and form that at Wyre, and is probably about the same date.

The church at Egilsey consists of a chancel, nave, and tower, at the west end of the nave, and stands nearly east and west. The extreme length is 62ft. 9in., and the width 21ft. 7in. On the west of the nave is a tower, which is circular, which appears to have been built with the nave, and to have contained four chambers, including the one on the ground. The top of the tower is now about 11ft. wide, and 48ft. from the floor of the nave. It is stated that about 15ft. was taken off the top. Probably it was surmounted by a conical roof. There was a church in Egilsey in 1110, the year in which St. Magnus was murdered. The attaching so large a tower to the church shows this was a church of a superior order when built. Taking all into consideration, it seems probable to suppose Egilsey to have been built soon after the conversion of the islands to Christianity in 998, or if built before that it must be assigned to the beginning or middle of the ninth century.

The number of churches once existing in Shetland is extraordinary, but of these only a few can be given.

Culbinsbrough Church, on the north-east coast of Bressay, originally consisted of a nave, north and south transepts, and chancel, of which only lower portions of the north transept and chancel, and a fragment of the east wall of the south transept, remain. The chancel is 6ft. east and west, and 10ft. north and south inside. The interior of the church has been used as a burial place, and two altar tombs remain.

The chapel on Noss consisted of a nave and chancel, of which only a fragment of the north

wall of the chancel remains. The nave was about 18ft. 6in. by 14ft. and the chancel about 12ft. east and west by 10ft. north and south, as shown by the ridge in the turf.

The Kirk of The Ness is in North Yell, and is said to have been dedicated to St. Olave. It consists of nave and chancel, with bell cot on the west gable. The roof is gone. The nave is 20ft. 5in. by 14ft. 10in. inside. The chancel is 13ft. by 11ft. 3in. inside. Taking all the points, this church may probably be assigned to the fourteenth century.

The church on Uya or Uyea consists of nave and building like a chancel. The nave is 16ft. 9in., by 13ft. inside. The building like a chaucel is at the west end, and is similar to that mentioned in the case of Enhallow.

GENERAL CHARACTERISTICS.

There is no cross church in Orkney, and only one in Shetland. In Ireland there is no circular, octagon, or cross church, except of course the cathedrals and some monastic churches. There is no aisle in Orkney and Shetland. There are no plinths or basements to any of these churches. The doors are chiefly in the west ends. Both square and round heads occur; several have no rabbets (see Birsey); St. Ola, Deerness, and perhaps Uya have no chancels; but all the rest have decided chancels. There is no instance of a chancel door. Orphir, Egilsey, The Ness, Culbinsbrough, Norwick, Kirkaby, and Colvidale have, or had, chancel arches of the same width as the chancels. In England this fashion rarely occurs—where it does it is late. It is constructively weak. Enhallow has a chancel arch with projecting jambs of about the English proportion. Birsey, Wyre, Linton, perhaps Uya, and probably Noss, have, or had, very narrow chancel arches.

In our early churches, the chancels were small in comparison with the naves; and in cathedrals the ritual choir was under the cross, or west of it. They elongated the choirs in the thirteenth century, and soon placed the ritual choir east of the cross. Orphir and Egilsey have windows with circular heads. Birsey, Wyre, Enhallow, and Culbinsbrough have at least some windows with flat heads. The Ness has all flat. No instance remains of a double light, nor of a triangular head, which is not unfrequent in Ireland, nor of a transom. At Egilsey, Enhallow, and The Ness are no grooves for glass, or rabbets, or external chamfers. At Orphir and Birsey are the grooves and chamfers (see account of Egilsey). Of the six churches which retain the east ends—St. Ola, Orphir, Deerness, Wyre, Egilsey, and The Ness—four have no east window, except that in the latter there is a small opening high up in the east gable. In the early Irish churches it is very unusual not to have an east window. Probably no apse was without an east window. As far as can be made out at present, there was no step to the chancel and no platform for the altar, except the inserted step and altar at Birsey. In some, the chancel windows are singularly low, as at Wyre and Egilsey. No piscina remains, and only one sedilia, but several ambries. There are only four cases where we can judge of the pitch of the roofs. The Ness had a roof, inclining about 85 deg.; Egilsey, about 88 deg.; Enhallow, the same; and Wyre, about 95 deg. Probably all had rude stepped coping on the gables, and were covered with thatch, stone, and slates.

MONUMENTS.

The gravestones found in connection with these churches are of four kinds:—

1. Keel-shaped slabs placed horizontally on graves, as at Sandwick, in Unst, etched by Mr. Irvine.

2. Upright stones, nearly rectangular, with crosses engraved on them, as at Sandwick, etched by Mr. Irvine, at Norwick, and at some other places. This class includes the elaborate monument from Culbinsbrough.

3. The same shaped stones without any ornamentation, found at many of the old burial grounds.

4. Upright stones cut into the form of crosses, as at Uya.

The coffins were often formed of six or more slabs of stone. Mr. Irvine has sent the following information:—"I believe from the earliest times in Scotland the footstone of the grave was the chief stone, and not as now the headstone, and that the east face of the footstone was the principal face to be attended to, from the idea that the dead rose at the Resurrection to an upright position facing east. Compare the stone with the ancient incised markings from St. Peter's Church, Orkney, now in the Edinburgh Museum, with the one I have etched from Sandwick, Unst, and I believe it will be seen that the keelstone existed to both. Therefore I believe that the interment belonging to many of the standing stones will be found on the west side and not on the east."

PROPORTIONS.

The designs for churches in the ages of architecture were not made at random. Doubtless there existed certain rules of proportion, but they varied with times, places, and persons. Various attempts have been made in modern times to discover these rules, and in some instances with apparent success. It unfortunately happens that we have not often an intact ground plan, and if the original plan was simple the additions render it complex. In many cases these additions were made without any regard to the proportion of the original. It appears probable that these proportions were geometric rather than arithmetical—that is to say, made by simple operations of the compasses and rulers, rather than by any proportions of numbers. The small churches of the North are valuable from not having been altered by additions. Though in the foregoing notes the proportions on which the churches were built may not have been ascertained in all cases, yet in some the coincidences are too remarkable to be by chance. Although no doubt a system of proportions was extended to the elevations and to certain details, yet, as to most of these in the churches here enumerated, we are in ignorance, because most of the superstructure is gone.

It appears that there were, in fact, only three figures on which the proportions were founded; a circle, a square, and an equilateral triangle. For most purposes of proportion the circle and square are identical. The *vesica piscis* is two equilateral triangles on opposite sides of a common base, and hence equal in proportion to the half of one such triangle. There is, however, one proportion in which a square is not equivalent to a circle—the diagonal of the square, the proportion of which to the side is nearly as 10 to 7. The height or length of an equilateral triangle is to half its base nearly as 7 to 4. All these proportions are somewhat flexible, inasmuch as they may include the side walls and exclude the end walls, or the reverse; or they may include both, or they may exclude both; or they may be applied in one way to the nave, and in another to the chancel, and in another to the tower. But the proportion must not be deemed as ascertained unless the figure really fits within two or three inches.

DATES.

As to the dates of these buildings we have but little to guide us. Only fragments of the buildings are left, and those of the plainest description. Scotch architecture has some mystifying peculiarities. Dates have been suggested from architectural and historical evidence for Orphir, Birsey, and Egilsey. Orphir, 1090-1160; Birsey, 1100; Egilsey, 1000; Wyre has been assigned to the twelfth or thirteenth, The Ness to the fourteenth, and St. Ola's to the sixteenth century.

It may be fairly observed that there must have been churches erected in the fourteenth and fifteenth centuries. Where are the remains of them? Possibly some of the ruins described are of those centuries.

It does not appear impossible that from evidence yet to be collected a nearer approximation to the dates of these buildings may be got.

Mr. William White thought that, with reference to the compartment at the west end of the church at Enhallow, it was probably, as in a similar instance at Wigginton Church, near Tring, for the priest to receive visitors in, if he was non-resident; or it might have been a sacristy used for marshalling processions. He thought that the remarkable smallness of the chancel in these early buildings pointed to a very high development of ritual, and that the chancels were evidently set apart solely for the highest offices of the Church.

The President thought that it was very unlikely that many of the students of the association would have visited the buildings described in Sir Henry Dryden's very interesting lecture. With regard to Sir Henry's query of how were the doors hung in these old buildings, he thought there was no necessity for them to have been hung inside the building, but that they might probably have been hung on pivots, as in many Egyptian and Grecian buildings. He thought the question of geometrical proportion could scarcely be applied to such early buildings as these.

A vote of thanks to Sir Henry Dryden was unanimously passed, and the meeting terminated.

RIGHTS IN CHURCHYARDS.

An important and somewhat peculiar case has just been decided at the Kingston Assizes. It was an action by the late rector of Tooting to recover a sum of thirty guineas for allowing a burial to be performed in a particular spot in the churchyard. The claim was first put upon the ground of a special contract, and it was next put upon a general right to recover in respect of the "use" of the ground by the defendant, the executrix of the deceased. It appeared that in 1858 the old churchyard became full and was closed, an additional burial-ground being provided. There was, however, a part of the churchyard, called the "fore-court," which had been reserved, and in which no burials had been performed. A lady died in the parish who was much respected, and whose friends therefore desired that she should be buried in that part. Accordingly the plaintiff, as the rector, was spoken to about it, and he said he would consent, but only on condition of a charge or payment of £30. There was no express assent to this, but an agreement to pay what might be proper, and it was hinted that the sum asked was high. The interment accordingly was performed on the spot selected, and the plaintiff sent in a claim for £30 for "breaking ground in an unusual part of the churchyard." The claim was resisted as excessive, though there was no objection to pay the sum of eight guineas for burial fees. The case has been twice tried. It was tried at the last spring assizes here before Lord Chief Justice Bovill, who rather thought that the plaintiff was not entitled to recover, and accordingly there was a non-suit, the legal question being reserved. The Court of Queen's Bench doubted upon the legal right, but desired to have the question of special contract re-tried, and therefore the case came down again for trial on the matter of fact. The evidence of contract being as above stated, it was strongly urged by the counsel for the defendant that there was no evidence of a contract by the defendant to pay £30, because there was no evidence of authority in any one to pledge the executrix to that sum (the deceased lady, a governess, having died in reduced circumstances, so that there were not assets to pay such a demand), but that even if there was such a contract there was no right in law to recover, because there was no right in the rector to make such a contract. Every person dying in the parish, it was said, had a right at common law to be buried in the churchyard, and not even burial fees could be claimed, except by custom. And this was not a claim for burial fees, but for the use of the ground, or for allowing a burial in a particular spot; and, as to the former ground of claim, while it was admitted that the incumbent must of necessity direct where a body should be buried, he must do so in the exercise of a discretion vested in him for the common good, and was not at liberty to make a market of it and sell his consent or his withdrawal of dissent to interment in a particular spot. To allow such a course, it was urged, would be to open a door to the most enormous, excessive, and oppressive abuses; and as to the claim for the use of the ground by the executrix, it was said it was utterly idle; it was a right in the deceased person to be buried in a churchyard, and the burial at a particular spot, as already mentioned, was a mere matter of discretion in the clergyman, who, therefore, was entitled to recover the burial fees which were usual and customary, and which, it was said, the defendant had always been ready to pay. The learned Judge, having heard these objections urged and argued at some length, at first was disposed to reserve them, but, having considered them while counsel were addressing the jury, he had a communication with them, which resulted in their consent to withdraw a juror and enter a verdict for eight guineas, the amount of the burial fees.

The well-known church of St. Charles Borromeo at Brooklyn, New York, has been accidently destroyed by fire. Many fine paintings and other valuable church property has been lost; and the damage altogether is estimated at 42,500 dollars.

PURIFICATION OF THE CLYDE.

THE condition of the Clyde, the Scottish Thames, has long been anything but satisfactory. Since 1851, when the population of Glasgow had reached 385,000, reiterated complaints have been made by the inhabitants of that city of the foul state of the river in the dry weather of summer. Various schemes have been proposed for its purification, and for the better disposal of the sewage, by which it is at present contaminated. The latest suggestion is embodied in a letter from Mr. Michael Scott, C.E., of Westminster, to the Lord Provost. Mr. Scott describes his plan as a project for the removal of the sewage, the improvement of the river, and the opening of a new navigation. The argument by which he supports his plan is—that, if in 1841 the river was comparatively pure, and complaints of the admixture of sewage were not made till years afterwards, although Glasgow and its suburbs then contained a population of 300,000, it was because the sewage was so diluted as to render it practically innocuous. It, therefore, follows that, if the same proportion between the volume of the river and of the sewage existed now as in 1841, the purification of the river would be accomplished. The problem to be solved is, either the quantity of sewage discharged into the river must be diminished, or the quantity of the diluting water must be increased, and the last idea is the one Mr. Scott proposes to execute. He opposes all projects that have been formed for the utilization of sewage, believing that, from local and other causes, and with the present knowledge possessed by sanitary engineers, it would be impossible to utilize it profitably. His idea is to add such a quantity of water to the river as will restore it to its comparatively healthy condition in 1841. At that period the minimum flow of upland water was estimated at 22,000,000 cubic feet per day of twenty-four hours. If, then, says Mr. Scott, a similar additional quantity of pure water were thrown into the river every twenty-four hours, dilution of the sewage would be the same when the population had reached 600,000 as in 1841. But, as the extension of the water-closet system, and the erection of numerous chemical works, have materially added to the quantity of foul matter discharged into the river, his plan provides for the supply of an additional 60,000,000 cubic feet. He proposes to construct a canal on the south side of the Clyde, extending from Finlayston Point to the lower end of Mavisbank Quay. This canal would be formed on the foreshore for the first 7½ miles, skirting the river bank, until it reaches Rashielee, when, striking inland, it would cross the Black and White Cart rivers above Inchinnan Bridge, continue to the south of, and nearly parallel with, the Renfrew-road, and terminate in a basin opening into the Clyde at Mavisbank Quay. The depth of this canal would be 8ft. at low water, and 15ft. at high water, and the breadth at half-tide level would vary from 140ft. at the seaward end, with sloping banks, to 50ft. at the Glasgow end, with vertical sides. The action of this canal would be as follows:—At low water at the lower end of the canal, the canal gates would be kept closed, until the water had risen 3ft. From that time up to high water the water would flow into and fill the canal, and then the gates would again be closed. At the upper end of the canal the gates would be closed till the tide had fallen to within 3ft. of low water mark. They would then be opened, and a vast body of water would pour into the river until the succeeding tide had risen 3ft. The effect of this, according to Mr. Scott, would be that, the tidal water having flowed down seawards diluted by the water from the canal, the channel of the river for some distance below Mavisbank Quay would be filled with comparatively pure water. With the upper river he would deal differently. He proposes to dam the river at Dalmarnock Bridge or thereabouts, and he calculates that, the dam being closed for four hours after high water, it would pen 12,000,000 cubic feet, and, being then thrown open to the succeeding high water, the delivery would be 12,000,000 cubic feet already stored, and an additional 25,000,000, or a total of 37,000,000 cubic feet, the ordinary natural downflow being about 10,000,000 cubic feet. He believes the channel would remain filled with pure upland water, and that the return tide would be prevented from bringing up foul water by the fresh water flowing down and meeting it. In addition to the purification of the river, Mr. Scott believes that his scheme will afford great additional facilities for its navigation, and that the new canal he proposes to construct will aid trade and enhance the value of property on its banks. Such a proposal as that of Mr. Scott may be practicable as far as increasing the value of the Clyde is concerned, but the utilization of the sewage, and the consequent purification of the river, should first receive attention.

MUREZZO MARBLE.

WE have recently seen several specimens of this composition, and there can be no doubt about its utility and beauty for the ornamentation of buildings. Its close imitation of marble is surprising. Like scagliola, it is made of cement, but fibre being mixed into the material makes it strong, capable of receiving hard blows without being broken, and renders it more easily moved from place to place. It can be made to any size, large or small, from a waistcoat-button to a panel 6ft. or 8ft. square, or larger if necessary. Any kind of marble can be imitated and executed with such a finish that it requires a well-trained eye to distinguish it from the genuine article. Being cast in moulds, it can be applied to a variety of forms, such as panels, mouldings, chimney-pieces, columns, &c. It is enduring, as it is not affected by wet or subject to discolouration by its close contiguity to jets of gas. The cost of material is much cheaper than any other imitation of marble. We may, therefore, expect to see the extensive use of this new patented article for decorative purposes.

VILLA NEAR SHEFFIELD.

WE this week draw the attention of our readers to the design of a house lately erected for Mr. Stacey, pianoforte dealer, in the Victoria-park, Broomhill, a very pleasant and fashionable suburb to the now rapidly increasing town of Sheffield. The architects of this work, Messrs. M. E. Hadfield and Son, of the same town, have taken the opportunity of introducing in the bay-window a cleverly-executed relievo, from the design of J. F. Bentley, Esq., by Mr. Phyffers, of Pimlico, the well-known sculptor. The *motif* has been taken from Dryden's familiar lines:—

> At last divine Cecilia came,
> Inventress of the vocal frame.
> . . . . . .
> Let old Timotheus yield the prize,
> Or both divide the crown;
> He raised a mortal to the skies,
> She drew an angel down.

The materials used in the erection of the house are the fine pier points from Dunford-bridge, and the dressings of Grenoside stone. The roofs are covered with small green and grey Welsh slates, arranged in simple patterns, and crested with a bold ridging of red tile; the hips are terminated with epis of lead. The entrance hall has a mosaic pavement, executed by Messrs. Maw, from the architect's design. On the upper landing of the staircase, in a space specially assigned, is an organ, enclosed with a richly decorated case of wood and metal; above, the ceiling is vaulted and formed of wood; the keyboard is placed in a recess of the dining-room. The work has been carried out, under the architect's superintendence, by the builders, Mr. Wilson, and Messrs. Stack and Grayson, of Sheffield.

DRURY-LANE THEATRE.

"OLD Drury" within six days and nights underwent a very considerable alteration to prepare it for the opera season, which commenced last Saturday. The portion of the pit formerly under the dress circle has been converted into a lower tier of private boxes, and the same change has been effected in the dress and upper circles, and in the sides of the second, while the central portion of the latter has been commodiously re-seated with stuffed chairs to form the dress circle. Above this are three rows of excellent amphitheatre stalls. The pit space is entirely occupied by luxurious armchairs, the pit proper being abolished. The floors of the principal tiers have been raised, so as to secure additional comfort and excellence of view, and inner corridors constructed to diminish the otherwise extreme depth of the boxes. The whole of the walls are lined with chintz, which produces a general effect of light warm grey, and the boxes are enriched with amber satin curtains, balances, and arm-rests. The alterations were designed by Messrs. Marsh, Nelson, and Harvey, of Whitehall, and carried out by Messrs. Bracher and Son, of Great Ormond-street. The gilding was restored by Mr. Kershaw, of Baker-street, and the upholstery and general fitting-up were executed by Messrs. Green and King, of Baker-street, the decorators to the old Opera House in the Haymarket.

A NEW SYNAGOGUE.

THE new Jewish Synagogue, Thornhill-road, Barnsbury, the foundation stone of which was laid last December, on which occasion we gave the chief features of the edifice, was consecrated on Sunday last. The building is in the modern Italian style. The synagogue proper is 65ft. long, by 45ft. wide, and 35ft. high, it is divided into three bays by floriated coupled iron columns supporting galleries, which are carried round three sides of the building, and octagonal coffered ceilings. The east end is appropriated to the sanctuary, which is approached from a flight of marble steps, its arches are supported by columns formed of various rare marbles. The decorative plastering is from first to last of a scriptural and typical character, and has been conventionally designed and modelled from examples obtained from the Kew Botanical Gardens—thus we find the fig, vine, the date, the blue rush, the olive, and the palm and corn, emblematical of the various characteristic of Faith. Over the sanctuary are tables of stained glass representing the ten commandants in Hebrew characters, and at each side of same are two stained glass windows of geometrical design. The buildings are entered from a portico leading to a vestibule communicating with a spacious hall, from which the visitors enter the ground floor of the synagogue, committee-room, gentlemen's lavatories, umbrella and retiring-rooms, &c. The staircase consists of three flights of bold character, two at the side and one in centre, and leads to a large landing, communicating with the ladies' galleries, lavatories, retiring-rooms, &c. The basement is appropriated to a beadle's house, metre room, and furnace-room. The ventilation is simple and effective. The lighting is by sun lights (which are contrived to assist ventilation) and ordinary gas jets. The heating is by warm water, and the acoustics have been well considered. Although not yet decorated with colour, the general appearance of the building is light, pleasing, and decidedly ornamental, and the effect is produced by simple and inexpensive means, depending on the æsthetical elements of pure outline, good proportion, and studied disposition of arrangement. The total cost of the building, including all fittings, will not exceed £6,000. The architect is Mr. H. H. Collins, M.I.B.A., 5, Queen-street, City. The builder is Mr. Henshaw, City Wharves Basin.

MINERAL PASTEBOARD ROOFING.

THE *Moniteur* records some interesting experiments made the other day in presence of the Emperor of the French, by Messrs. Maillard and Co., with their roofing by means of mineral pasteboard. Certificates signed by the most eminent engineers and architects of the day, as to the impervious and durable quality of this new substance, having been laid before His Majesty, he consented to be present at certain comparative experiments on the combustibility of various systems of roofing. Three sheds, says the correspondent of the *Star*, were accordingly erected in the reserved gardens of the Tuileries—the first covered in by Muller tiles, the second by sheets of zinc, and the third by this newly-invented mineral pasteboard. Fires of equal intensity were lighted beneath each; the zinc roofing melted in ten minutes, that of tiles fell in at the expiration of twenty, whilst that composed of sheets of mineral pasteboard bore the weight of a man for the space of half an hour. The extreme lightness of this roofing, which naturally admits of very slight carpenter's work; its cheapness, imperviousness to rain, as well as the property of resisting fire, will prove of immense value in the construction of farm-buildings, where lime roofing now causes so many disastrous accidents. The Emperor, we are told, was struck by the fact that the introduction of this new roofing would reduce the tariff of insurance offices.

We believe that it is the intention of the Royal Society to memorialize the Government to erect a statue to Faraday, in Westminster Abbey, at the national expense.

GROTESQUES.

ALTHOUGH the first impressive power of a building must always depend on the grandeur of its leading forms and general proportions, its right to achieve and maintain a complete hold in our favour must also be gained by the addition of beauty, fancy, or power in its details. Just as the plot of a novel or drama has to be backed by a careful delineation of incidents and characters to form a complete work, in like manner to the finest general scheme of a building must be added the careful working out of individual features and details. In all ages of art, the representation of animal forms has played a conspicuous part as an adjunct, or as a detail, and man, not always content with the representation of Nature as it is, has been prone to invent new forms or combinations of animal forms. The Egyptians had their sphinxes, their hawk and monkey head deities; Assyria, its gods, part human, part bird or quadruped; Greece and Rome, their centaurs, griffons, and chimera; and mediæval art its endless variety of grotesques.

In this representation of animal forms, as in everything else, there may be good or bad art. Art true or false, and human-headed bulls, sphinxes, and combinations of the same kind, like the rarer monsters of the show-booth, only show us what, in the natural course of things, ought to be avoided. There must be strong and apparent sympathy betwixt all the parts in a good grotesque, and no representation in sculpture of what would be abhorrent in actual life ought to be tolerated; and, though sphinxes, centaurs, and human-headed bulls were allowable when they served as symbols, their repetition or imitation by us would be vapid and unmeaning. To this same want of principle may be traced a great deal of the bad mediæval grotesque art, though the Gothic artists in a better period overcame the difficulty by giving the human head some of the attributes of the bestial body (say, horns or ears, as in figure 7), and so assimilated the whole. But the true rule to be followed is the imitation of Nature. Take her in her wildest or most humorous forms, in her quaintest conceits, *conventionalize* as *unnaturally* as you please, and the result will always be in some degree satisfactory. The representation of animal forms assuredly gives an amount of life to a design far beyond the reach of mere ornament, and the sketches submitted are only intended as suggestions to aid the revival of this very interesting section of architectural detail. No. 1 is intended as the finish of an ornamental pinnacle or buttress; Nos. 2 and 3 are pinnacle terminations; Nos. 4 and 5 are designs for timber bracket ends; No. 6 is a crocket, and No. 7 a gargoyle. (See lithographic engraving.) J. M. S.

RAILWAYS AND THE PUBLIC.

APPROACHED from any point of view the railways of the United Kingdom do not at present occupy a very enviable position. Presenting appearances of anything but good investments to the capitalist, their bad financial character is in no way redeemed by any benefit gained by the public at large. It is true that we travel with speed and security at a cheapness of cost formerly unknown; but the results obtained fall far short of what might have been done if the railway system had been originally harmoniously devised and carried out. The money that should have yielded a good return to the shareholders has been shamefully squandered by rival companies in Parliamentary contests, and the public in a thousand and one instances has suffered on account of their quarrels. A pamphlet on the subject has just been published by Mr. Raphael Brandon, F.R.I.B.A., having for its object the promulgation of a plan whereby railway shareholders might reap advantages in proportion to those conferred on the public, by the adoption of a better system. This, in Mr. Brandon's opinion, is only to be accomplished by the Government taking up all the railways in the kingdom. The Post Office, the Money-order Office, and the proposed absorption of the Telegraph Companies by the Government, he regards as but partial recognitions of the one great principle, that in matters so virtually interwoven with the well-being of the community as the forwarding of intelligence, and even parcels, it is advantageous that the carrying trade of the country should not be left to the mercy of private speculators, but should be maintained by a well-organized and comprehensive system for the general convenience of the public who pay for it. According to his plan the whole of the railways should be united under one general management, becoming a recognized branch of the public service, available to the whole population; and that passengers should be enabled to travel one journey, of any distance, in one given direction, at a sum little more than nominal. Threepence is the minimum sum upon which his calculations are based—existing fares below the proposed minimum to remain as at present. He supposes that the adoption of this minimum rate would increase sixfold the number of persons who at present travel by rail. We find, from the general summary for the year ending 1865, that 251,959,862 passengers were carried, producing fares to the amount of £14,724,802, giving an average of nearly 21 miles, and 73 passengers for each train—that is about 3½ passengers for each mile, the average fare paid by each passenger being 1s. 2d. Six times the number of passengers, Mr. Brandon says, could be carried for a very small, if any, additional expense; and, if an universal fare of threepence was charged for any distance for each person, six times the number would travel, and would produce £18,896,989, being £4,172,187 in excess of the present receipts. He further divides the passengers into halves, supposing that one-half would travel at single fares, and the other by another arrangement, which forms the second part of his plan. Thus, dividing the first half of 755,879,586 passengers into fair proportions of first, second, and third class travellers, charging 1s. for first class, 6d. for second class, and 3d. for third class, he gets £16,197,419 as the total half receipts. The other half he considers would take yearly tickets, which he proposes to issue at £25 first class, and £15 second class, entitling the holders to travel any distance, any time, in any direction; and the receipts from this source he calculates at £19,031,765, making a gross total of £35,229,184, against the present yearly receipts (1865) of £14,785,802, and giving an increase of £20,443,382—truly a most glorious prospect for railway shareholders!

"There will be, no doubt," says Mr. Brandon, "many persons who will deem the idea of carrying a passenger from London to Edinburgh for threepence preposterous; but let such remember that it was not until Sir Rowland Hill had shown its feasibility that any one thought it reasonable to take a letter from London to Edinburgh at the same charge as from London to Richmond. It may be said that the analogy does not exist, that the half-ounce of a letter is nothing, but that a passenger is really heavy, and makes some difference in the cost of running a train. In reply, I say that the delivery of a letter is the most expensive part of its cost to the Post Office, whereas a passenger takes himself away; that the average of trains that run could each carry six times as many passengers as are now conveyed by them; and, though the expense might be slightly increased, the increase could be but extremely small, while the receipts, as I show, would be enormously augmented." Here, of course, the whole gist of the argument lies, and it is here we think Mr. Brandon's case breaks down. The probability is that, instead of six times the present number of passengers, ten times the number would travel. Is Mr. Brandon prepared to say that this would entail but a very slight additional cost? Would even the present station or iron way accommodation be anything like sufficient? Mr. Brandon seeks to establish an analogy between himself and Sir Rowland Hill, but the latter had the logic of facts on his side, and therefore triumphed. He plainly demonstrated that, with the resources then at his command, a half-ounce letter could be carried 100 miles for a farthing, and thus established a basis from which all his calculations rose. Mr. Brandon, on the contrary, looks solely to his swollen receipts, and gives us the mere assertion, really nothing more than a surmise, that the present expenses will prove very nearly, if not quite sufficient. Upon this uncertain data, without the shadow of a calculation to support it, we cannot rely, and therefore do not expect much from Mr. Brandon's scheme. In fact, we regard it as utterly indefensible. It would be as reasonable to propose that the Government should supply all the ladies of the country with bonnets at a uniform price. Mr. Brandon has written on a subject which he does not understand, and which apparently he has taken no pains to master. Besides, we regard it as one of the saddest signs of the times that so many people call for Government interference to effect any public good. Are the departments so easily and economically administered as to justify their multiplication? Take, for instance, the Admiralty, a pet department of the Government. The waste, the extravagance, the mismanagement, and the political jobbery of this department are notorious. Pretty much may be said of the Ordnance Department. But Mr. Brandon would, without a pang, create a greater department than either, and so increase the system of centralization which is a curse to continental Europe.

ARCHÆOLOGY.

General A. Cunningham (eldest son of the late Allan Cunniugham, and the greatest authority on Indian antiquities, &c.) describes a very valuable ancient gold coin just brought from Bokhara, in India. He terms it the great gold Eucratides. "It is 2½in in diameter, and weighs ten staters, or eleven guineas. It has the helmeted head on one side, with the horsemen and inscription on the reverse. The owner has refused £700 for it. It beats all the Greek coins hitherto discovered."

It may be recollected that the Theatre of Augers was burnt down about two years ago. The *Moniteur* now states that, the municipality having fixed upon the site to be occupied by the new edifice, its foundations have been begun, and advantage has been taken of the circumstance to make some archæological researches. The new ground was formerly the Christian cemetery of the capital of the Counts of Anjou, and at different periods five large collegiate churches were built upon it, the last of which was pulled down in 1793. M. Armand Parrot, secretary to the Société Académique of the department of Maine-et-Loire, and intrusted with the superintendence of the excavations, has had the good fortune to discover the Gallo-Roman chapel in which the first bishops of Anjou used to officiate and preach to the Pagans who had recently embraced the Christian religion. This little temple was, therefore, the cradle of Christianity in that province, and for this reason excites the highest interest. Two other crypts of different periods have likewise been found, which present some curious architectural details. One of them, called after St. Réné, contains a large number of very fine sarcophagi of various shapes; some of them belong to the Mérovingian period, and consist of magnificent monoliths, in the interior of which skeletons in a perfect state of preservation have been discovered. A number of Carlovingian inscriptions, a variety of Roman and Gothic capitals, church utensils, weapons, &c., have gone to enrich the local museum. One of the most interesting articles brought to light is a complete set of female ornaments, including a pair of ear-rings, which have excited great admiration in consequence of their peculiar form. M. Parrot has also, in the course of the diggings, hit upon the well into which the blood of the victims of the guillotine during the Reign of Terror was re-

ceived. The blood is still there in a dry state, and chemical analysis has shown that it is uncontaminated by any other substance.

SCHOOLS OF ART.

Wolverhampton is not in a favourable position, compared with other towns, in regard to its schools of art. In Birmingham there were, we believe, upwards of 1000 students, and the number is continually increasing. Even such places as Stourbridge, Dudley, and Kidderminster have thriving schools, though it cannot be said that in either of these three places there exists anything like the necessity for a school of art as at Wolverhampton. We find, from a report of a public meeting held there last week, that the school of art has for a considerable time past been in a languid condition, and the number of artizan students has now dwindled down to 50. The subscriptions last year amounted to the small sum of £70, and the expenditure for the last four years has exceeded the income by £50. A fresh effort is now to be made with a view of furthering the interests of the school, and making it a means of usefulness to the artizan population of the district.

The Council of the Wakefield School of Art having placed the school in connection with the Science and Art Department at Kensington, have obtained about £300 worth of models, examples, &c., for the use of the students, and have secured the services of Mr. Walter Smith, Head Master of the Leeds School of Art, as manager. The classes commenced on Monday. On Tuesday evening Mr. Smith delivered an address, on "Art Education," in the Music Saloon. A museum and library are shortly to be opened in connection with the institution.

PARLIAMENTARY NOTES.

In the House of Commons on Monday, Lord Eustace Cecil asked the Secretary of State for the Home Department when the report of the Commission on False Weights and Measures, referred to by him at the close of last session, was likely to be issued, and what prospect there was of his being able to introduce a bill upon the subject this session. Mr. Hardy said the report was delayed in consequence of the death of some members of the commission, and at present he was not in a position to say when he should be able to lay it on the table of the house. On the same evening, Lord John Manners, in answer to a question put by Mr. Cowper, intimated that considerable difficulties had arisen in consequence of alleged interference with ancient lights, which had delayed the works at Burlington House, and he was therefore afraid that the works would not have advanced sufficiently to enable the Royal Academy to vacate Trafalgar-square, and hold their next year's exhibition at Burlington House.

Mr. Gregory, on Friday, once more brought forward the "unseemly congestion" of the various collections in the British Museum. He recommended the abolition of the family trustees, and of all the *ex officio* trustees, with the exception of the three principal ones, who might retain the patronage. There would then remain fifteen, and he proposed that they should be divided into three boards, with each of which should be associated one of the heads of the three departments, who should be responsible to the officer who was directly responsible to Parliament. With regard to the drawings, he trusted the moment the National Gallery was in a condition to receive the drawings of the great masters, they would be removed there. As regarded the mediæval collections, the Saxon, Roman, and mediæval British collections ought to be kept intact within the British Museum, but the foreign mediæval collections, such as the majolica, ought to go down to Kensington. Mr. Disraeli lamented that Parliament had not bought, as it might once have done for a comparatively small sum, the Duke of Bedford's park in Bloomsbury. No doubt the present constitution of the Museum was anomalous. The Government had prepared a bill, which had been referred to the trustees, for the separation of the national collection.

It is stated that the bill to authorize the removal of the Natural History Collection from Bloomsbury to South Kensington has already been approved by the trustees, and the scheme may be said to be complete, with the exception of some minor details of administration which still require adjustment.

WATER SUPPLY AND SANITARY MATTERS.

The North Shields Waterworks Company have nearly completed their large pumping establishment beside Preston Whitehouse. There is every prospect, it is said, that, before the summer is over, an ample supply of water at high pressure will be brought into the town.

At the ordinary monthly meeting of the Glasgow Water Committee held on Monday, it was resolved, by a majority of 9 to 2, to proceed with the scheme for supplying public works with water drawn from the Clyde, instead of Loch Katrine. It is proposed by this scheme to draw 15,000,000 gallons a-day from the river, 7,000,000 gallons of which are to be supplied daily to sixteen factories specified in the Act of Parliament. The new water will be supplied considerably below the price of that from Loch Katrine, which latter, it is believed, will in a few years be required for domestic purposes alone.

Large sums are being spent in straightening and improving the old serpentine river Witham, Lincolnshire, erecting bridges, &c. This river for a considerable distance is the receptacle of vast quantities of water. The object of the works now in operation is to prevent the overflowing and bursting of banks which is now constantly occurring. Mr. Neale, of Mansfield, is engineer to the commissioners, and the works are being executed by Messrs. Fast and Co., of Melton Mowbray.

Building Intelligence.

CHURCHES AND CHAPELS.

The restoration of Aveton Gifford Church, near Kingsbridge, is about to be effected. The tender for the work of Mr. Willcocks, Aveton Gifford, at £1,997 has been accepted.

A new Wesleyan chapel was opened last week at York. The building consists of one large room 61ft. 6in. long by 40ft. wide. The materials used are red and black bricks, relieved by arches and strings of white bricks. Mr. Edward Taylor, of York, was the architect.

A new church, to be called the Hamilton English Presbyterian Church, has just been commenced in Laird-street, Birkenhead; it is intended to accommodate 620 persons. The contract is being carried out by Messrs. Anderson and Sons, of Liverpool, for the sum of £2,200. Mr. James N. Crofts, 7, Cook-street, Liverpool, is the architect.

St. Helen's Church, Bishopsgate, was reopened, after restoration, on Tuesday last. The floor has been lowered throughout to its original level, and the chancel paved with tiles by Minton, after pattern of some ancient ones discovered embedded in the floor. The church has been entirely reseated, the fine old carved stalls from the nun's choir forming the present choir. Several handsome windows, filled with stained glass, have been added to the church. Great care has been taken with the collection of monuments, probably the finest in the City of London. The work has been carried out under the superintendence of Messrs. Wadmore and Baker, architects.

On Saturday week the corner-stone of a new Wesleyan chapel was laid at Tom Fowd, near Bolton. The building will be of brick, with stone dressings, and will cost about £800. Mr. John Lord, of Farnworth, is the contractor.

A new church to be built entirely of brick, to hold 750 persons, and to cost £6,400, is to be erected at Blackheath, near Birmingham. The design, which is in the Early Pointed style, is by Mr. W. J. Hopkins, of Worcester. The plan has a clerestoried nave with aisles, a chancel of equal height with the nave, with a transeptal organ chamber on its north side, and a western tower and spire.

The late Mr. James Fallows, of Manchester, has bequeathed £10,000 to the Manchester Diocesan Church Building Society, besides £10,000 each to five of the Manchester charities.

The work of the new Catholic church at Longton has been intrusted to Mr. Heveningham, of Wolverhampton. His tender was £9,150, and there were two lower than his. Mr. Pugin is the architect of this church, which we have previously described.

On Monday, the foundation stone of a new Methodist chapel was laid at Blyth, Newcastle. The edifice, which will seat 750 persons, will be a plain one, without any architectural features about it, and its dimensions are 66ft. long by 51ft. broad, and 30ft. high, with a gallery around the interior. The whole work will be done by Mr. Middleton, contractor, of Blyth.

The church of St. Bartholomew the Great, Smithfield, said to be the oldest in the city of London, was reopened on Sunday by the Bishop of London after restoration. The work has been in hand during the last four years, under the direction of a committee, of whom Mr. Tite, M.P., Mr. Beresford-Hope, M.P., Mr. Hardwick, R.A., and Mr. Foster White, treasurer of St. Bartholomew, were among the principal members. Upon the restoration between £5,000 and £6,000 have been expended. It is said to be unique as an edifice of the Norman style of architecture. Its massive solidity had suffered little from the lapse of time, and its chief features, after so many centuries, remained unimpaired. Hence the work of restoration has been, not so much the repair of the fabric itself, as the removal of a mass of rubbish by which its stately proportions had been, to a great extent, obscured for generations. Rahere, a gentleman of the court of Henry I., and described by a contemporary historian as "a man of singular and pleasant wit, and therefore by many called the King's jester and minstrel," was the founder of the church, the erection of which was begun 1103, and is said to have been finished about 1113. When complete it measured 280ft. in length, and had a nave, which was pulled down at the Reformation, 87ft. long, and 60ft. broad. The building is now about 130ft. by 57ft., and 47ft. high, with an open timber roof, which is supposed to be as old as the fabric itself. At the end of the south aisle is a square brick tower, 75ft. high, containing five bells, and erected in 1628. A fire in 1830 destroyed a beautiful chapel of the time of Edward III., with a large western archway, which stood on the western side of the south wing. Of Rahere, the founder and first prior of the church, an effigy and tomb are still to be seen within its walls, inserted within a screen, and in a good state of preservation. On the south side of the clerestory is an oriel window, built by Prior Bolton early in the sixteenth century, and ornamented by his rebus—an arrow inserted through a tun,—hence, probably, the origin of the sign "Bolt-in-tun." The church contains some very ancient monuments besides that of Rahere; among others the Elizabethan tomb of Sir Walter Mildmay, founder of Emmanuel College, Cambridge, who died in 1589, and of Rycroft, the King's printer of the Polyglott. Among its baptismal records is that of William Hogarth, dated November, 1697.

BUILDINGS.

The old Infirmary at Sunderland has been purchased by the Primitive Methodists, and is being converted into a Theological Institute. The alterations, at a cost of £600, are being carried out in accordance with plans prepared by Messrs. Joseph Potts and Sons, architects, of Sunderland.

There is every probability of Leicester-square and its immediate neighbourhood being turned before long into a theatrical market-place. Negotiations have been for some time in progress for the purchase of the old and now deserted Sablonnière Hotel, which stands at the south-east corner of the square, and was once the residence of the great painter Hogarth. The intending purchasers are a popular dramatist, a popular novelist, and their friends, and the design of the purchasers is to convert it at once into a theatre. If the new street from St. Martin's Church to Oxford-street should be constructed in the line intended by the Metropolitan Board of Works, the Sablonnière will then be left in an advantageous corner position. Simultaneously with these negotiations others are in progress for the purchase of the site of Savile-house, the object being to construct a first-class playhouse on that spot. Shortly after the fire in the spring of 1865 which destroyed that building, the various holders of the property demanded something like £48,000 for the freehold—a price that frightened several theatrical proprietors of that period. It is now confidently stated that a well-known *impresario* and the chairman of a great hall company have almost completed the purchase. A site in Tichborne-street is also spoken of as an "eligible" and probable place for another theatre, and it has been carefully surveyed several times for this purpose during the last four years.

NOTICE.

FRIDAY next being GOOD FRIDAY, the "BUILDING NEWS" will be published on THURSDAY, the 9th inst. Advertisers and others are requested to forward all communications not later than Five p.m. on WEDNESDAY.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

Notice.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

Received.—R. V.—S. N.—W. S.—I. M. S.—W. T.—L. L.—C. B.—P. and K.—A. F. K.—I. P. S.—H. H.—C. and B.—A. T. B.—I. P. S.—W. P.—I. H.—H. and N.—W. and C. K.—W. H. W.—L. B. and Co.—I. H.—I. W. T.—E. R. P.—W. R.—L. W. and A.—I. W.—W. L. C.—I. C.—I. H. M.—C. L.

W. P.—Apply to Lockwood and Co., 7, Stationers' Hall-court.

Correspondence.

THE NEW HOUSE OF COMMONS.

To the Editor of the Building News.

Sir,—Severe illness prevents my answering Mr. Talbot Bury's letters in your next impression as fully as I had intended. But time presses, and I wish to say a few words on the New House of Commons. I have not the slightest wish, nor am I at the present moment physically capable of entering into any competition, but I have a fair right to demand that the present or any future Government shall not allow itself to be hoodwinked or cajoled into the perpetration of another job for the new House of Commons, such as that which has just come to maturity in the detestable and useless corridor, and the other works in New Palace-yard. The honour of a nation should be sacred in the hands of its executive, and the interests of art should never be sacrificed to any actual or supposed hereditary claim. Let three architects, who are known to possess some skill in Perpendicular work, be selected. By all means let Mr. E. M. Barry be one of them; and, if he can produce a fitting design, exhibiting the same feeling, character, and finesse as the original building, I should be the last person to oppose his appointment to carry it out. In justice, however, to the cause I maintain, I cannot forbear renewing my testimony to the fact that what he has accomplished is simply an absolute and too costly proof of incompetency, which, by its contrast with the old work, places him in a very much worse position than if he started *de novo*. Should the authorities disregard the successive warnings, which have reached them from all sides from men who are perfectly competent to offer an opinion, they will be condemned by universal opinion. £100,000 is rather too much to pay on the top of £27,000 for a still more extensive fiasco.—I am, &c.,

E. Welby Pugin.

PUGIN *v.* BARRY.

Sir,—The energies of Mr. Clayton—although I do not presume to place myself on a level with such a master of analysis—and the persistent blundering of Mr. Talbot Bury, are totally misapplied and superfluous. I really think that it would be much more to the purpose, if, instead of throwing the dust of their small inferences and inquiries into people's eyes, they would direct their attention to such facts as the following:—

1. Mr. Herbert, without insisting on the identity of every detail, saw with his own eyes Mr. Pugin make the designs for the Throne substantially as it is at present. He remembers all the circumstances connected with it, and has described them, as we all know.

Mr. Edward Pugin saw his father make several different designs, one of which was made on board a Ramsgate steamer.

I, myself, saw three different designs, which I know to have been by Mr. Pugin. They were lost at the railway station at Birmingham, found by me, opened and discussed in my presence as Mr. Pugin's; and I vividly remember Mr. Pugin's complaints of the trouble he had been subjected to, and the labour unnecessarily inflicted on him through Sir C. Barry's perpetual changes.

Mr. Pugin's Diary speaks of a "Throne" drawing made by him at Salisbury, and sent to Mr. Barry on November 12, 1835. Dr. Barry (Notes, p. 6) acknowledges that "a drawing of the Throne, by Mr. Pugin, for the estimate drawings still exists."

Mr. Clayton, last week, in your journal, tells us that, amongst the drawings referring to the Throne exhibited recently at the Arundel Society's rooms, "one of them, a general design of it, was, beyond all possibility of doubt, by Mr. Pugin," which, he adds, "was, no doubt, the one Mr. Herbert saw in progress."

Mr. Wolfe (Dr. Barry's Notes, p. 9) says that "Pugin worked on the Throne, and that the greater part of the ornamental detail of it was his." Mr. Wolfe also informs us that Sir Charles Barry wrote to Pugin, on Sept. 3, 1844, saying "that he had made a new design for the Throne," at which time Mr. Pugin paid Sir Charles, at his own entreaty, a visit of five days to work (as is always impressed on us) on the details. Yet Dr. Barry informs us that the design for the Throne, in his pamphlet, is dated Dec. 17, 1844. In other words, the details were worked out by Mr. Pugin about three months before the design was made by Sir C. Barry.

Now, it is really inconceivable that, with all these indisputable facts before these gentlemen, the sole inference deduced from them is exactly that which is the least probable, viz., that Sir Charles made the design in the photograph himself. And this inference, moreover, is shackled with the monstrous inconsistency, just elicited from Mr. Wolfe's statement—that the details were made by one person three months before the design was made by another.

2. Mr. Talbot Bury asks whether Mr. Pugin's brother-in-law, Mr. J. Powell, has not seen this drawing of the Throne, and has informed him that Mr. Bury is right and Mr. Herbert wrong? I answer that Mr. Powell has made no such unqualified admission. I have before me a letter from him to Mr. Edward Pugin, wherein he admits that "the drawing looks wonderfully like Mr. Pugin's touch," adding, "one thing is *certain*, it never could have existed without his mind." This is, in reality, the pith of the whole matter. Mr. Pugin's mind, manifested in all the other designs he made for the Throne, is manifest in this as well. It flashes out plainly enough, in spite of the "main lines" and "Pugin-like symmetry of square forms," which are assumed so positively to be the attributes of Sir C. Barry's work.

3. It would conduce very materially to a settlement of this question if we were informed whether there are in existence any more drawings of this kind said to be by Sir C. Barry—any of the "general drawings of all the internal fittings of the House of Lords," made during Mr. Pugin's visit to Brighton in 1844.

4. Let me remind Mr. Pugin's antagonists that the general question about the original design is not in the remotest degree settled by this minor discussion about the Throne. The Throne drawing, indeed, makes the "nursery secret office" doubly suspicious, and at the same time calls from Dr. Barry for an explanation of the fact that Sir C. Barry's visit to Mr. Pugin at Salisbury, from Nov. 2 to Nov. 9, 1835, is not entered in Sir C. Barry's Diary.—I am, &c., T. S. Burton.

21, Savile-row.

ORGANS.

Sir,—Schulze's bellows may be old fashioned, but, for all that, they are steadier than Willis's: no one is asked to use Schulze's bellows, but Willis is asked to improve his. Gigantic organs, gigantic architecture, gigantic bands and choruses, are not tests of the artists. There is only a certain quantity of variety of tone possible—it is not necessary to have a gigantic instrument to produce it. We all know that an orchestra beyond a certain size produces no greater effect of tone than one of a sufficient number of players. As to the British public and its capacities, I am sure your correspondent has not seen many of the scores of Covent Garden and Her Majesty's. I do not know any other public that will swallow as much. We make slight alterations in this country when the evening is hot and the singers out of humour, but this is entirely a matter of opinion. As to the emasculate tone of the old instruments, well it is what I admire. I think it mellow, full, round, delicious, refined, free from either thin sharpness or noisy vulgarity, but this is also entirely a matter of opinion. If Willis does not think it necessary to have good metal, why are the 32ft. pipes in the monster organ to be all tin?—I am, &c.,

Warrington Taylor.

190, Euston-road.

Sir,—I am sorry that the interesting controversy on Organs seems drawing to a close, as we sometimes arrive at the truth after wading through much misrepresentation. Your correspondent "J. C. J." can have but very little knowledge of organ pipe metal, when he asks us, why, if metal has so much tin in its composition, it is not spotted? Now, spotted metal is produced by mixing certain quantities of tin with good lead, in proportion varying from one-third to two-thirds of tin. If metal, containing about these proportions, is not spotted, it is because the spot has been planed out. The pipes in the organ at St. Paul's Cathedral are made of metal containing three-fourths of tin to one-fourth of lead, and that composition will not spot on account of its richness. I notice that "J. C. J." calls the Kingston organ "a very large organ," and then says that Mr. Lewes has never built a really large organ. Mr. Lewes is the builder of the celebrated organ in St. Hilda's Church, South Shields, an instrument that for beauty and power of tone far surpasses any instrument of similar size constructed by Mr. Willis; in this (the St. Hilda's) organ the wind reservoirs contain, according to Mr. Rae's published account, 160 cubic feet of air. If "J. C. J." will tell us how much air can be contained in the reservoirs of the Kingston organ, we can then judge for ourselves whether the organ at South Shields entitles Mr. Lewes to be classed with the "great" organ builders or not. I suppose that even Mr. Willis must have had a few "small country church organs" to build in his time, and were they small because he had not then talent enough to build large organs? I should also like to know where Mr. Lewes's unsuccessful specimen of an organ exists? and why Mr. Willis, with all his talent, and an immense sum of money at his disposal, so failed to fill the Liverpool Townhall with his gigantic organ of over 100 stops, that he has lately been obliged to add a number of very powerful reed stops, at (I believe) a pressure of 22in.?—I am, &c.,

Y. Z.

THE BIRMINGHAM SPRING EXHIBITION.

Sir,—Being on a visit to Birmingham (chiefly on account of the Exhibition) I have more than once visited the Architectural Room, making notes respecting the various drawings as I went through. As an architect of some position in London, and consequently having had much experience in designing and carrying out work (chiefly church architecture), I feel convinced you will not refuse to allow me a little space in your valuable paper for their insertion. I am also happy to say Birmingham is considered by London people to possess some of the finest and most imposing buildings in England, and the people are considered art-loving and art-encouraging. Having said this by way of preface, I will commence my criticism.

The Gothic style appears to preponderate over Italian, and the examples of both styles are, on the whole, very good. The designs of Mr. J. G. Bland may be mentioned as very thoughtful studies in Gothic architecture, the views of Stroud and Acock's Green Churches being specially worthy of remark. The etching is beautiful. This gentleman has, I believe, distinguished himself by numerous structures, in which polychromy is used extensively, chiefly in brickwork. Mr. J. A. Chatwin's design for St. Augustine's Church, Edgbaston, and St. Lawrence's Church, Birmingham, shows a deep knowledge of Gothic, and a considerable amount of æsthetic feeling. Mr. G. Holmes's designs are also worthy of remark. Mr. John Davis, jun., sends three elaborate drawings. Assuming that he is a young man, the drawings do him much credit. The two etchings show immense labour and perseverance, and, though abounding in faults, are very promising. The coloured drawing is not so satisfactory, being somewhat crude and approaching to tawdriness. How-

ever, if Mr. Davis perseveres (studying carefully our best ecclesiastical structures, and wedding himself to no particular branch of Gothic), he may in time do something really meritorious. The drawing by Mr. F. Barlow Osborn is a very successful attempt to adapt Gothic to commercial requirements. It has a solid substantial appearance, and its proportions are good and detail elegant. The drawing of Norwich Cathedral by Mr Bakwell is a very interesting and faithful representation of the interior of that noble edifice. Among the other Gothic works must be mentioned those by Messrs. Nichols, Ingall, Veall, &c., many of whose designs are satisfactory. Among the Classic contributors are Messrs. Chatwin, Yeoville Thomason, Holmes, Bateman, and Corser, Phipson, Plevins, &c., most of whose designs are good, but not so interesting to a lover of Gothic architecture as the former.

The collection of photographs is very interesting. Most of them are taken from the works themselves. For sharpness and delicacy, I have never seen them surpassed. I trust I shall have the pleasure of seeing most of the above drawings at the London Architectural Exhibition next year.—I am, &c.,

A London Architect.

Farringdon-street, London.

LOW ESTIMATES.

Sir,—The letter from "Fair Play" in the Building News, March 13, induces me to take up my pen and vindicate myself and others who are not the lowest in these "low tenders," and who wish to see justice done to builder and proprietor, by explaining the unprincipled way in which the work is carried out in a contract now in the course of execution, for which I and a few more were invited to tender. My business calling me to Portsmouth, I thought I would prolong my journey to Hayling Island to see the building I had tendered for, when the highest tender was sent in at £2,054, and the lowest at £845, and which had to be completed by the 25th of March, subject to a penalty of £10 per week after that time until completed. On my arrival I found, a short distance from the railway station, only the carcase of the building that had to be completed by March 25! I asked to see the foreman, but found there was not one, and that there were but five or six men on the job. I was told that the "governor" would be there shortly, and, as he did not arrive, I made a survey in his absence, and I discovered that timber and other materials, far inferior in quality and less in size than those mentioned in the specification, were being used. I much doubt if this can pass. In justice to the proprietors, I can say that the wording of the conditions and specifications for this building is very explicit, but it is far from being carried out.—I am, &c.,

Fair Play's Mate.

THE NEW ISLINGTON WORKHOUSE.

Sir, The statement in last week's number with reference to this building is incorrect. Since the selection and adoption of my design, the compulsory requirements of the Poor Law Board have considerably increased the cost. The infirmary, planned on the Pavilion principle, provides just upon 500, and the "separation wards" 1,300 cubic feet per inmate, as against the 500 cubic feet asked for in the first instance. Central stoves have been preferred for the wards instead of fireplaces in the side walls, as originally intended, with additional kitchen, scullery, and other internal arrangements; also a detached doctor's residence, and a large dispensary. The cubical capacity of the casual ward has been increased. Several improvements, suggested by myself, and not included in their original instructions, have also been adopted by the Guardians. The amount stated in the original instructions issued by the trustees was, including the margin of 10 per cent., about £40,000. The amount of the accepted tender, which, in addition to the Poor Law requirements, &c., above stated, includes "sanitary" fittings of the most approved description, piping for hot and cold water, warming, and gas throughout the entire building; also for all enclosing and other walls, earthwork, drainage, &c., is, on the other hand, under £62,000.

57, Oxford street, W. Robt. Hy. Burden.

Intercommunication.

QUESTIONS.

[789.]—PLATINUM DISCS.—Can any reader inform me where, and at what price, platinum discs for economising gas, as exhibited at the last soirée of the Royal Society, are obtainable? An increase of the quantity and quality of light is much desired by all, and especially by—A Night Worker.

[790.]—QUANTITIES AND PRICES OF TIMBER.—Will some one tell me how to understand the quantities and prices of timber and deals, as advertised in the Building News, and the meaning of duty and drawback, &c? How many lineal yards or feet of 11in. by 3in.; ditto, of 9in. by 3in.; ditto, of 7in. by 3in., or cubic feet, to the load or hundred?—Ignoramus.

[801.]—THE AUTO-PLANOGRAPH.—Can you inform me where I could obtain a sketch and description of the auto-planograph, exhibited by Mr. R. Jahns, at the Liverpool Architectural Society's meeting, mentioned at p. 210 of the Building News; or can you give me Mr Jahn's address? If so, you would oblige a subscriber.—H. Francis Clarke.

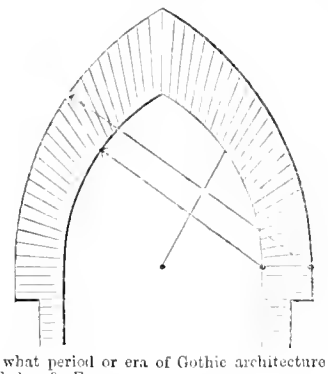
[802.]—A SEA WALL.—Sir,—Please insert the following in your journal as soon as convenient, and oblige:—A sea wall, built in 1866, enclosing a parcel of ground to be used as a promenade, the height of which above the ground was 7ft, and the thickness about 2ft. 6in., about three weeks since succumbed to the force of the sea during a heavy gale, and was a second time destroyed. As it is intended to rebuild it, I should be obliged by yourself or any of your readers giving me any plan by which it might resist the force of the sea. It was built with good heavy stone, laid on edgeways, and cemented with best Portland. I should also think it a favour if you could give me a receipt for making good concrete.—Alexander.

[803.]—MOUNTING DRAWINGS ON CLOTH.—Would "C. E., Tor may," oblige a subscriber by giving a description of his way to mount drawings on cloth? and oblige yours—A Constant Reader.

[804.]—EYESIGHT.—I shall be obliged if I can be informed whether continual working in a shop where all the glass is frosted does not tend to injure the eyesight?—D.

[805.]—DRAWING INK.—Could you, or any of your readers, enlighten me as to the best ink I can use in drawing on a substance very similar to ground glass or slate? It is necessary that the ink should stand the effects of being washed.—S. T. H.

[806.]—ARCHES.—Is this arch constructionally good;



and to what period or era of Gothic architecture does it rightly belong?—F.

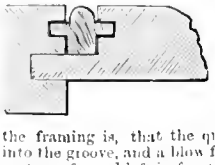
[807.]—TUNBRIDGE WELLS INFIRMARY COMPETITION.—Can any of your readers furnish information respecting the above-named competition? In 1866, an advertisement appeared, inviting architects to send in designs for certain alterations and additions to the infirmary before January 1, 1867. An extension of time was given, and the day finally selected for sending in the designs was April 1 (All Fool's Day, be it observed), a day singularly well chosen, and possibly intended as a dismal joke at the expense of the dupes who responded to the invitation.—An April Fool.

[808.]—MEASURING OLD BUILDINGS.—In measuring old buildings I often have to guess the height of some unaccessible point, from not knowing how to obtain it without a theodolite. Will you readers kindly tell me whether there is any easy method of doing this accurately without instruments?—Ecclesiologist.

[809.]—TENDERING FOR OLD LEAD.—I tendered for the old lead on a church roof at so much per ton, as weighed in the churchyard. Can I claim for a per centage for dross, or must I give exactly what I have offered without making any deduction whatever?—Plummet.

REPLIES.

[767A.]—BEAD AND FLUSH FRAMING.—Seeing your previous correspondents disagree as to the right construction of bead and flush panels, I think the proper construction is an



astragal tongued in dry, as in sketch; but I am afraid that, in these days of cheap foreign joinery, this is too much to expect from builders; though this would be cheaper than the bead on the framing. My objection to the bead on the framing is, that the quirk of the bead nearly cuts into the groove, and a blow from the other side breaks the portion of wood left in front. This is also often effected by dampness causing the tongue of panel to swell, and so bursting the face off. I object to the bead on the panel, because the shrinkage of the panel (generally the widest piece of wood in the framing, and therefore subject to greater expansion and contraction) causes the end bead to slide on the mitre and assume a curved form, finding employment again for the joiner's enemy putty. But, as work is generally executed, I should give the preference of the two plans, except in thick framing, to the bead on the panel.—Robert Phillips, Foreman of Works, Dobroyd Castle, Todmorden.

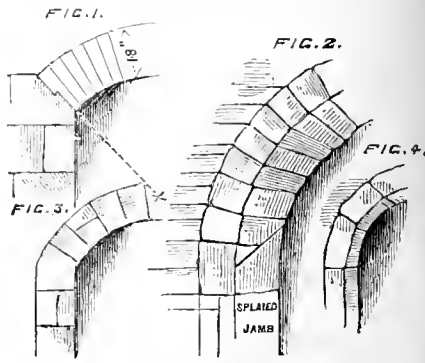
[775.]—COMPETITIONS OF DRAWINGS FROM EXISTING BUILDINGS.—I beg to say that I went and measured an old wood roof to a church some few miles from where I reside, and had no difficulty whatever when I got to understand the sexton; and, further, I intend measuring and drawing the whole church, some parts of which are Fourteenth century.—Another Constant Reader.

[779.]—AGREEMENTS.—If there was a stamped agreement stating the price the builder was to pay the subcontractor, the work must be paid for at the rate mentioned in that agreement, and the builder must supply a copy of it. But if it was not stamped within a month of the date of the signature it will not hold, and the work must be paid for measure and value, at the usual market prices, as determined by a licensed surveyor.—F. T.

[784.]—"PRACTICAL BUILDER" AND TREATISE ON CIRCLES AND RAMPS.—The most practical treatise on circular surfaces and ramps, and oblique arches, and the best and most useful information upon practical building, may be found in "Gwilt's Cyclopædia," published by Longman and Co.—T. T. H.

[790.]—BOOK OF DESIGNS FOR CARVINGS.—If "W. F. H." is in earnest, and wishes to obtain grace and variety in the forms of vases, he cannot do better than study the Etruscan Vases in the British Museum. One day spent in studying and sketching from them would do him more good than any number of books.—W. T. R.

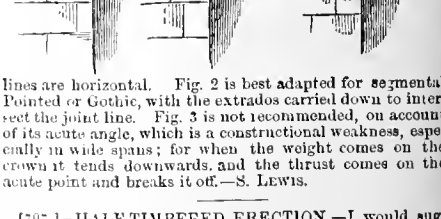
[793.]—SHAPE OF ABUTMENT STONES.—"F." has shown his abutment stones as they are generally formed for



modern works. Fig. 1, in the above sketch, would seem more appropriate and secure than what he has shown; fig. 2 shows an interior abutment stone; and figs. 3 and 4 are exteriors, all of which radiate from different centres. The latter three sketches are from ancient examples.—Clerk of Works.

[793.]—The question of your correspondent amounts to a principle, and is not "purely a matter of taste." It is a matter of pure taste—the maximum amount of beauty for the minimum amount of cost. Referring to the sketches, and remarking that it is highly inexpedient to work a stone at an acute angle, then No. 3 would be objected to on principle, because the projecting beak would crumble away with a very slight knock. And as for No. 2, let one fancy the trouble and expense of cutting out the nasty corner at the bottom, not forgetting the fact that, if the arch stones are, as is generally the case, of a strongly contrasting colour, the arch would appear to be either flying in the air or resting on a pane of glass, ever seeking the opportunity of slipping down, to the discomfiture, at least, of people's minds, if not their bones. I, therefore, prefer No. 1, both constructively and æsthetically, and cannot see the difference whether used in what your correspondent is pleased to call "Classic or Gothic," as being the most common-sense method—a method which, alas, is not apparently so highly developed as the opposite one of "freaks o' fancy." The question recalls to memory those pointed brick arches where the bricks are "rubbed" into all sorts of earthly shapes merely that the joints shall radiate to one common centre instead of to two—not knowing why, unless it be that the cost should be increased five times.—H.

[793.]—There is no general rule for the shape of abutment stones. Some adopt one and some another form; but for strength and repose fig. 1 suggests itself, where the main



lines are horizontal. Fig. 2 is best adapted for segmental Pointed or Gothic, with the extrados carried down to intersect the joint line. Fig. 3 is not recommended, on account of its acute angle, which is a constructional weakness, especially in wide spans; for when the weight comes on the crown it tends downwards, and the thrust comes on the acute point and breaks it off.—S. Lewis.

[797.]—HALF-TIMBERED ERECTION.—I would suggest to "W. W." to line over the inside of his partitions with ½-inch rabbetted boarding, the face of which should be left rough for papering. I would also advise "W. W." to dispense with such flimsy constructions, and adopt the Portland cement concrete walls, which would be durable, and, in a sanitary sense, much more healthful of the two.—F. H. Luscom.

STAINED GLASS.

The church of St. Michael, North Waltham, Hants, rebuilt in 1866, has recently been enriched by the placing of several stained glass windows, by Baillie, in memory of the late Rev. Henry Carey, M.A.

A stained glass window has just been completed and fixed in the north-east side of the chancel of South Molton Church, Devonshire. It has a large four-light window. The subjects in the four top lights are The Blind Receiving Sight, The Lame Walking, The Lepers Cleansed, and The Dead Raised. The subjects of the lower panels are Feed the Hungry, Give Drink to the Thirsty, Clothe the Naked, Visit the Sick. The window is by Messrs. E. and S. Beer, of Exeter.

STATUES, MEMORIALS, ETC.

The model of the statue of President Lincoln, which is to form part of the "Lincoln monument" to be erected by the War Fund Committee, has been completed by the artist, Mr. H. K. Brown. The statue, which will be of bronze, will be 9ft. in height, representing Mr. Lincoln in a standing position, holding in his left hand a copy of the Emancipation Proclamation, with the right hand pointing to the words, "Shall be for ever free," engraved thereon. The statue will rest upon a pedestal 15ft. in height, ornamented with appropriate devices. The total cost of the monument will be 15,000 dols., which amount has been fully subscribed in one dollar subscriptions. The monument will be placed in the Park, near the great fountain.

WAGES MOVEMENT.

It is calculated that at least 1,500 operative builders are on strike at Geneva, and the wages of whom amount to about £240 per day. The master builders have issued an address to the men, in which they say—"With your energetic concurrence, we shall be able to avoid a general strike; learn to unite to resist the tyranny of an association; learn to oppose to it the free expression of your will. Free and independent workmen, make use of your liberty; make known your opinion, and prove that the International Association represents but a small minority, whose violence and threats cannot intimidate you."

Letters from Philadelphia inform us that throughout the United States, at the beginning of the year, the working men submitted to a marked reduction of wages in nearly every branch of labour.

It is stated that, in addition to the numerous dismissals of hired artizans and labourers which have taken place at Portsmouth, and at other yards, a reduction to the extent of 1,200 men will be made at Woolwich yard alone.

LEGAL INTELLIGENCE.

Claim against Chapel Trustees.—Parkes *v.* Mountain and others.—In this case before the Birmingham County Court, Mr. Parkes, tube maker, Birmingham, sued George Mountain, John Palfreyman, Jabez Reynolds, and John Page (trustees of the United Methodist Free Churches Chapel, at Ridding-lane, Wednesbury), to recover £46, being the price of work done in putting a warming apparatus into the chapel. The execution of the work in question was not disputed, but the defendants alleged that the agreement to do it had been made with a Mr. Brotherton, of Wolverhampton, who undertook to execute it for £25. Mr. Brotherton had taken the chair at a tea-meeting of the congregation in December, 1866, and the defendants alleged that Mr. Brotherton on that occasion remarked that the chapel was very cold, and some further conversation taking place, he undertook to get the chapel warmed for £25, and give six months credit. The defendants were willing to pay £25 for that work in the terms of the alleged contract. Mr. Brotherton was called, and denied having made any offer to put a warming apparatus in the chapel for £25, or for any other amount. He denied having alluded to the warming of the chapel in any remarks that he made on the occasion of the tea-meeting. Mr. Parkes, the plaintiff, and his brother, were also called, and deposed to doing the work on instructions received from Mr. Palfreyman, one of the trustees of the chapel. George Mountain and John Page, two of the defendants, were called, and swore to Mr. Brotherton offering to warm the chapel for £25. The judge said that no doubt there had been a misunderstanding on the part of the defendants as to who was to do the work for them, but they were legally liable, and the verdict must be for the plaintiff for the full amount.

NOTICES OF PUBLICATIONS.

"Recollections of the Paris Exhibition of 1867." By Eugene Rimmel: Chapman and Hall, 193, Piccadilly.

M. Rimmel, the well-known perfumer, was an Assistant-Commissioner of the Paris Exhibition, and wrote a description of it in two French newspapers, which he afterwards published in a collected form. He has here given us an English version of that work. Perhaps his attractively got-up little volume has been somewhat late in appearing; still it is interesting enough, without being very original, and will, no doubt, be to many a welcome souvenir of the latest, and in some respects the greatest, of the International Exhibitions. M. Rimmel, it may be stated, joins heartily in the opinion that the jury awards, as a whole, and particularly as regards this country, were open to censure. "Eminent noblemen had to judge manufactures with which they were totally unacquainted, and learned doctors to pronounce on the merits of fancy articles which all their science did not enable them to appreciate." His argument is that the right man was not in the right place. Again, the jurors were originally misinformed as to the time when they would be wanted, and the result was the paucity of rewards obtained by British exhibitors, which gave rise to loud complaints.

"Rating of Railways." By Edward Ryde, Surveyor: Cassell and Co.

In the form of letters, each letter complete in itself, Messrs. Cassell are issuing a series of practical reference books, from the pen of Mr. Ryde, of Parliament-street. The present pamphlet treats of the rating of railways, a subject of special interest to professional men, but one little understood by the public at large. In connection with railway rating, a vast number of questions have to be considered, and Mr. Ryde brings the experience of thirty years to elucidate and explain the general rules and principles to be adopted. In a small shilling *brochure*, of thirty-six pages, this wide subject is necessarily treated very briefly, but this is, perhaps, a merit. In subsequent letters the author will deal with land surveying, compensation cases, timber measuring, light and air questions, dilapidations and nuisances, and other subjects of importance to men in his profession, and not without interest to the general public.

"Manual of Wood Carving, &c." By W. Bemrose, Junr. With an Introduction by Llewellynn Jewitt, F.S.A. Fifth Edition: Bemrose and Sons, 21, Paternoster-row.

We have had recently to notice more than one new manual of Wood Carving, and we are now called upon to notice another which has reached a fifth edition. This may presumably be taken as a proof that the art is being more generally practised than formerly, and that carved furniture, and other objects, are coming into general favour. "Take care of the beautiful," said Goethe, "and the useful will take care of itself." There is truth in the maxim. But wood carving, it may be said, is not more beautiful than useful. As Mr. Jewitt, in an elegant introduction to Mr. Bemrose's work, remarks, "There is scarcely an art to which our English homes are so much indebted for their beauty, their comfort, and their attractiveness, as that of wood carving; and there is none which is capable of more development, or of being practised with more pleasurable results, than it is." Nor is the notion well founded that, because a piece of furniture is carved, it must be costly. In one sense, carved furniture is costly, but there can be no doubt that it is 50 per cent. less expensive than much of the veneered furniture, and more than 500 per cent. better and richer looking. The manual before us, which is chiefly intended for the instruction of learners and amateurs in the art, is superior to most works of the class we have seen, in the number and variety of examples of carving it gives, suitable for general use—*i.e.*, for domestic furniture. Some of the side-board backs and the book-cases are rich and elaborate, and would require very considerable skill on the part of an amateur for their successful execution. Others of the designs are more simple, but equally effective, and in good taste. The church furniture, which includes lecterns, stools, chairs, almsbowls, &c., is good on the whole. Two new features in wood carving are, we observe, introduced in Mr. Bemrose's work. The one he has named "Diaper Carving:" it consists in the groundwork, or parts usually cut away in carving, being punched in patterns, thus throwing up the design with such force that the effect is almost equal to carving itself. This is an improvement on the old method of filling subordinate parts by scribing. Furniture made up entirely on this plan looks remarkably well, says the author, while it can be rapidly executed. The other new feature is the introduction of club nails (known as "cast hobs"), which may be introduced with advantage on various parts of carved work, as shown in several of the plates. These nail-heads may be of various shapes, and when placed at intervals of half-an-inch along the edge of a plain shelf, they produce a very neat appearance. This manual shows great taste in the getting up, and is published at a very low figure, considering the number of plates, and the amount of instruction it contains.

"Workmen and Wages at Home and Abroad." By J. Ward, author of the "World and its Workshops," &c.: Longmans.

The great argument of this work is briefly this:—The workman has no right to insist on his master paying him higher wages, if the master can find a man who can supply his place for lower wages; nor has a workman the right to say to his fellow-workman, that he shall not work for such wages as he likes himself, but at such wages as the other likes. If workmen have a right to demand higher wages, the master has an equal right to refuse them. If the master depends upon the workman's labour, it is equally clear that the workman depends upon the master's capital; and to compel the master to raise wages beyond what he can afford is injustice and tyranny, and must in the end be the ruin of both master and man. Mr. Ward endorses the conclusions that trades'-unions are founded for an unsound purpose, and that, consequently, their moral effects are bad; that society can be best aided by free and open competition; and that education and forethought alone can secure to every one his just reward. He reviews very ably and interestingly the condition of workmen and wages here and on the Continent as well as in America, and his reflections lead the author to this other conclusion, that there is probably no other country on the face of the globe where sober, industrious, young mechanics and labourers can so soon raise themselves to ease, independence, and comparative comfort as here—in no other country in Europe are the working classes so free from enforced taxation as they are in Great Britain. It would be well, thinks Mr. Ward, for the great body of the working classes if they understood, or would even take the trouble to understand, the economic laws by which they are governed, and which are as fixed and enduring as the great laws of the universe. We are afraid that some of the acts which have taken place in connection with recent labour agitations and trades'-unions, as well as not a little of the published evidence before the present Royal Commission, go to prove only too conclusively the soundness of these opinions. On a former occasion we gave some statistics from Mr. Ward's book to show that the general earnings of Paris workmen in the different branches of industry are much below those paid in this country. The work is appropriately dedicated to Mr. Gladstone.

Our Office Table.

The Dublin papers announce the death of Mr. Bernard Mulrenin, a distinguished miniature painter of that city, and president and secretary of the Royal Hibernian Academy.—M. Picot, the veteran historical painter, has just died at Paris, aged 82. He obtained the first prize of L'Ecole des Beaux Arts, with his "Mort de Jacob," so long ago as the year 1813.

Mr. W. Gibbs Rogers, the carver, is about to sell by auction his collection of several hundred specimens of old Italian, Flemish, Venetian, and French works, carvings by Grinling Gibbons and Chippendale, and many of Mr. Rogers's own works of original designs and working drawings.

Although subsequent search at the works of Messrs. Bell and Black, at Bow, has not resulted in any additional "find" of china of any importance, collectors of this ware continue to manifest great interest in the recent discoveries by their attendance in considerable numbers to watch the operations of the excavators. Most of the specimens of Bow china hitherto recovered have unfortunately been broken by the pick-axes of the labourers engaged in cutting the drains.

Among the many marvels of this marvellous age, not the least, thinks the *Leader*, is the conversion of a railway arch into a theatre, with boxes, pit, gallery, and stage, all complete. This, it would seem, is in course of construction near the Elephant and Castle, and immediately contiguous to Mr. Spurgeon's tabernacle.

A meeting of operative house-painters was held on Wednesday evening at Cleveland Hall, Fitzroy-square, to hear a deputation from the Manchester Alliance of Painters, on the necessity of a better organization in the London trade. Several speeches were made, pointing out the advantages of unions, and urging members of local societies to unite themselves to the Manchester Alliance, which was conducted on the federative principle. After some discussion, resolutions were adopted, pledging the members present to co-operate with the Manchester Alliance.

We hear that the town of Willington is to have a public park, through the liberality of Lord Boyne. The ground will shortly be laid out, and a bridge requires to be built, in order to connect the two portions of the estate divided by the river Wear.

The following will act as presidents of the various sections at the Norwich meeting of the British Association for the Advancement of Science:—Professor Tyndall, mathematical section; Mr Frankland, chemical section; the Rev. M. J. Berkeley, biological section; Lord Strangford, geological section; Right Hon. W. E. Gladstone, M.P., statistical section; and Mr. G. P. Bidder, mechanical section. Professors Olley and Huxley, together with Mr. Scott, of the Board of Trade, are also expected to deliver lectures.

The number of women artists in New York has become so large as to justify the formation of a society for the aid of all their sister artists who may be in need. To raise a fond for this purpose it was proposed, at a recent meeting, that each member of the association shall contribute a picture once a year to the exhibition, which shall then be sold for the benefit of the society. Mrs. Pope has been named president, and Mrs. Gray treasurer of the society, a number of gentlemen being appointed "an advisory committee" to counsel and assist the ladies.

Mr. Whitworth, the well-known engineer, has intimated to the Government his readiness to place in the hands of trustees a sum sufficient to provide £100 a year for thirty young men who have passed a satisfactory examination on the subjects of "Technical Education." The details of the scheme, says the *Pall Mall Gazette*, have not yet been arranged.

A new patent feeding holder, applicable to writing and ruling pens, has just been introduced by Messrs. Rowney and Co., of Rathbone-place. The roling pen, which will contain a supply of Indian ink sufficient for several days, appears especially suitable for architects. Mr. Gilbert R. Redgrave has used the pen, and has found it thoroughly to answer his purpose. He says that the ingenious method by which the ink is forced into the nibs seems to him to completely overcome the tendency to blot possessed by all previous self-feeding pens. The construction of the instrument is very simple, and its use easily acquired, and he has no hesitation in stating that it is a valuable acquisition to the architect.

The *Mechanics' Magazine* believes that leaden tobacco-boxes have nearly disappeared in this country, though it sees some occasionally. Dr. Mayer, of Berlin, it is remarked, has traced six cases of lead colic and paralysis to the use of these utensils. M. Chevallier has also found that tobacco, wrapped in lead foil, becomes impregnated in the course of time with acetate of lead.

A large proportion of the lucifer matches used in this country are imported from abroad. The Match-Making Company of Jonkœping, in Sweden, furnishes a large quantity. In 1866 they made 45,693,241 boxes, of which 36,000,000 were sent to this country. They make a considerable number of matches on a plan of their own in which phosphorus is not required.

"A correspondent," says Mr. Vale, "the week before last, gave an account of a building just completed with a smoke tower, and no chimneys. I beg to state that a gentleman in Devon adopted a similar plan some 35 years since. It proved to answer all anticipations, and the draughts from the several fireplaces were perfect. But the idea of making a building without chimney tops! They should be added to a house especially for foul air shafts, for all voids between floors, cellars, basements, and every other room throughout, a matter of vital consequence, but too often little regarded."

By a process which is still a secret, Mr. Adolphe Braun, of Dornach (Haut-Rhin), has produced an immense number of absolute *facsimiles* of the best drawings left by the great masters. These new photographs are superior, it is said, to all former works of the same kind in the ordinary excellencies of detail and surface-quality. They also reproduce exactly the tint of the original neutral, brown, red, or greenish, as the case may be. The new photos are confidently asserted to be absolutely permanent, but this must of course remain to be proved by time.

The will of the late King of Bavaria, which was read at Munich the other day, contains some very interesting bequests. The testator bequeaths the Walhalla, near Ratisboone, to all Germany; the Temple of Glory, near Munich, the Monument of the Deliverance, near Kilheim, and the other buildings which he possessed to King Louis II., to whom he recommends his poor dependants. Prince Leopold receives the Chateau of Leopold, and the marble quarries of Untersberg.

Eastwell Park, Kent, the residence of the Earl of Winchilsea, had a narrow escape of total destruction by fire last week. The flames, however, were subdued, after doing damage to the extent of £12,000.

MEETINGS FOR THE ENSUING WEEK.

Tues.—Institution of Civil Engineers,—"The City Terminus Extension of the Charing Cross Railway," 8. Second, on "The Experimental Determination of the Strains on the Ties of a Bow String Girder," by Wilfred Airey, Assoc. Inst. C.E.

Society of Arts.—"Cantor Lectures," the Conversion of Chloride of Sodium into Carbonate of Soda; the Decomposition of Common Salt into Hydrochloric Acid and Sulphate of Soda; Glauber's Salt; the Transformation of this Compound into Soda Ash, Soda Crystals, and Bicarbonate of Soda, Ballard's Process, and the important and recent Discovery of the Utilization of Soda Waste, &c., Illustrations.

Wed.—Geological Society, 8

Sat.—Associated Arts Institute, Committee Meeting.

Trade News.

TENDERS.

Carshalton, Surrey.—For villa residence, for Mr. W. H. White. Messrs. Goodman and Vinall, architects. Quantities supplied:—

Simpson	£1,042
Shepherd	980
Lathey Brothers	976
Rhodes and Roberts	934
Sharpington and Cole	839
Jarrett	834

Charlton.—For rebuilding Infant School, Charlton, Kent. Mr. W. Wigginton, Cornhill, architect:—

Ennor	£592
Kilby	555
Axford and Whittier	555
Abraham	530
Walker	502

Charlton.—For Almshouses, Charlton, Kent, for the trustees of the Dutch Church, Austin friars, E.C. Mr. W. Wigginton, architect, Cornhill:—

Abrahams	£3174
Kilby	3122
Ager	3117
Ashby and Sons	3038
Macey	2991
Hill and Keddell	2969
Ennor	2865
Axford and Whittier (accepted)	2833

Goldenhill.—For the woodwork of two houses and shops. Mr. R Dain, architect, Burslem:—

Halfpenny	£340 10 0
Wooldridge	325 0 0
Bennet and Cooke	315 0 0

Hanley.—For the erection of six houses on the Grove estate. Quantities supplied. Mr. C. Lynam, architect, Stoke-on-Trent:—

Sutton	£3,900
Matthews	3,737
Collis and Hudson	3,669
Oakley and Minks	3,580
Wooldridge (accepted)	3,562

London.—Rebuilding No. 19 and 20 Walbrook, E.C., for Messrs. Lawson and Sons. Mr. Wimble, architect:—

Myers and Son	£3,560
Piper	3,337
Newman and Mann	3,195
Adamson	3,190
Colls	3,156

By Mr. C. Moore.—Freehold two cottages, situate in Edward road, New Barnet, let at £26 per annum—£325.

Freehold residence, situate in Henry road, New Barnet, annual value £30—£385.

Freehold residence, situate in Henry road, New Barnet, annual value £30—£385.

Freehold residence, situate in Henry road, New Barnet, annual value £30—£380.

Freehold residence, situate in Henry road, New Barnet, annual value £30—£380.

Freehold plot of building land, in Henry road, New Barnet—£110.

Freehold two residences, known as Elizabeth villas, Victoria road, New Barnet, producing £52 per annum—£710.

March 24.

At the Mart.—By Messrs. Debenham, Tewson, and Farmer.—Copyhold residence, with stabling and coach house, No. 564, Mile end road, annual value £90—£1,210.

Leasehold two residences, Nos. 25 and 26, Albion square, Dalston, let at £38 per annum each, term 94 years from 1845, at £12 per annum—£800.

Leasehold residence, known as St. Germain's Lodge, St. Germain's road, Forest Hill, let at £60 per annum, term 99 years from 1866, at £6 per annum—£600.

Leasehold improved ground rents, amounting to £240 per annum (for 76 years), secured on nine residences in Highbury grove—£4,490.

Freehold property, known as Holm Elms, Wimbledon, comprising a residence, with stabling, coach house, garden, grounds, and farm yard, with farm buildings, the whole comprising nearly 12 acres—£8,400

By Messrs. Bond and Son.—Leasehold shop and premises, No. 33, Brill place, Skinner street, Somers Town, annual value £28, term 54½ years from 1827, at £3 per annum—£105.

Leasehold residence, No. 40, Bedford row, let on lease at £120 per annum, term 21 years from 1854, at £100 per annum—£65.

March 25.

At the Mart—By Messrs. E. Fox and Bousfield.—Freehold house, No. 20, Clarence street, Rotherhithe street Rotherhithe, let at £14 19s. per annum—£140.

Leasehold two houses and shops, Nos. 7 and 8, Bedford row, Lower road, Rotherhithe, producing £44 per annum, term 32½ years unexpired, at £6 per annum—£360.

Leasehold residence, No. 13, Victoria road, St. John's Wood, annual value £130, term 99 years from 1855, at £18 per annum—£1,550.

By Messrs. Candy and Luckin.—Leasehold residence, No. 43, Jackson road, Holloway road, let at £38 per annum, term 98 years from 1864, at £6 per annum—£375.

Leasehold residence, No. 43, Lowman road, Jackson road, Holloway, let at £40 per annum, term 99 years from 1866, at £6 per annum—£375.

Leasehold house, shop, and premises, No. 1, Roman road, Barnsbury, let at £40 per annum, term 99 years from 1859, at £6 per annum—£400.

Leasehold two houses, Nos. 2 and 3, Roman road, producing £69 16s. per annum, term 99 years from 1859, at £12 per annum—£540.

By Messrs. W. and C. Moore.—Leasehold two houses, Nos. 2 and 3, Montrose terrace, Roman road, producing £60 per annum, term 92 years unexpired, at £12 per annum—£550.

Leasehold business premises, No. 1, Ebury square, Pimlico, let on lease at £24 per annum, term 99 years from 1791 at £1 6s. 3d. per annum—£190.

Leasehold house, No. 55, William street, Regent's Park, let at £61 2s. per annum, term 99 years from 1823, at £7 per annum—£525.

Leasehold residence, No. 40, Hawley Road, Kentish Town Road, let at £44 per annum, term 92 years from 1846, at £6 per annum—£510.

Leasehold residence, No. 21, Crowndale road, Camden Town, let at £44 per annum, term 99 years from 1844, at £6 per annum—£615.

Leasehold residence, No. 25, Ampthill square, Hampstead road, let at £67 10s. per annum, term similar to above at £16 10s. per annum—£905.

Leasehold two residences, Nos. 35 and 36, Harrington square, Hampstead road, producing £142 per annum, term 99 years from 1843, at £22 per annum—£1,980.

Leasehold residence, No. 64, Gloucester crescent, Bishop's road, Bayswater, let at £100 per annum, term 95 years from 1854, at £2 per annum—£1,630.

Leasehold two residences, Nos. 16 and 17, Rutland street, Hampstead road, producing £95 per annum, term 97 years from 1840, at £10 per annum—£1,345.

Leasehold two residences, Nos. 6 and 8, Harringay Street, Rutland Street, Hampstead Road, producing £100 per annum, term 99 years from 1825, at £16 16s. per annum—£1,420.

MARCH 26.

AT THE MART.—By Mr. Newbon.—Policy of Assurance, amounting, with bonuses, to £1,262 10s. 6d., effected with the Norwich Union Office on the life of a gentleman aged 76 years.—£640.

Leasehold improved ground-rents, amounting to £32 per annum, secured on eight houses in Iseldon road, Hornsey road, term 80 years from 1862—£575.

Leasehold improved ground rents, amounting to £13 4s per annum, secured on six houses in Wellington street, Holloway, term 99 years from 1859—£215.

Leasehold improved ground rent of £12 per annum, secured on No. 37, St. George's road, Notting Hill, term 99 years from 1862—£200.

Leasehold residence, No. 3, Whitley villas, Caledonian road, let at £40 per annum, term 90 years from 1852, at £8 per annum—£525.

By Mr. John M. Dean.—Freehold house and premises, known as Perseverence Cottage, Abbey street, Barking road, annual value £15—135.

Freehold ground rent of £18 per annum, secured on six houses in Albert road, Plaistow road—£355.

Freehold ground rent of £6 per annum, arising from two houses in Lower Hamlet's road, Forest lane, Forest Gate, £115.

By Mr. Henry Staines.—Freehold six houses, Nos. 1 to 6, Park place, Sale street, Bethnal Green road, producing £70 4s. per annum—£510.

MARCH 27.

AT THE MART.—By Messrs. Debenham, Tewson, and Farmer.—Leasehold house, No, 194, Albany road, Camberwell, term 14¾ years unexpired, free from ground rent—£210.

By Mr Skinner.—Leasehold house, No. 2, Cornwall terrace, Creek Bridge road, Deptford, let at £26 per annum term 76 years unexpired at £3 per annum—£150.

Leasehold collar factory in rear of the above, let at £50 per annum, term similar to above, at £8 per annum—£505.

Leasehold piece of ground, situate in Knott street, Creek Bridge road, term similar to above at £3 per annum—£80.

By Messrs. Broad, Pritchard, and Wiltshire.—Leasehold groundrents of £39 10s. per annum, arising from seven houses in Russell terrace, Holland road, Brixton, term 80 years from 1842—£540.

Leasehold three houses, Nos. 14 to 16, Inkerman road, Kentish Town, producing £74 per annum, term 56 years, unexpired, at £5 per annum—£615.

Leasehold house and shop, No. 108, Euston road, let for three years at £75 per annum, term five years unexpired, at £45 per annum—£50.

Leasehold residence with stabling, known as Bloomfield Lodge, Portsdown road, Maida Hill, let at £72 per annum, term 81¾ years from 1856, at £15 per annum—£840.

Leasehold residence, No. 3, Portsdown road, let at £55 per annum, also the house in the rear, let at £16 per annum, terms similar to above, at £13 per annum—£690.

Leasehold residence, No. 2A, Camden Park road, annual value £45, term 98 years from 1863, at £8 per annum—£400.

Leasehold residence, No. 33, Patshull road, Kentish Town, annual value £45, term 85½ years from 1865, at £6 per annum—£450.

Leasehold residence, No. 12, Church terrace, Kentish Town, let at £25 per annum, term 67 years from Lady-day, 1868, at £5 per annum—£250.

Leasehold residence, No. 15, Church terrace, rent, term, and ground-rent same as above—£235.

Leasehold residence, No. 16, Church terrace, let at £26 per annum, term and ground-rent same as above—£245.

Leasehold residence, No. 21, Church terrace, let at £26 per annum, term and ground-rent same as above—£245.

Leasehold residence, No. 22, Church terrace, let at £26 per annum, term and ground-rent same as above—£245.

Leasehold residence, No. 24, Church terrace, let at £26 per annum, term and ground-rent same as above—£250.

APRIL 1.

AT THE MART.—By Messrs. E. Fox and Bousfield.—Leasehold, 15 houses, three with shops, Nos. 47 to 61, Murray street, Hoxton, producing £522 per annum, term 99 years from 1843, at £82 per annum—£5,150.

Leasehold, two houses and shops, Nos. 175 and 176, Edgware road, producing £125 per annum, term four years unexpired, at £6 12s. per annum—£340.

Leasehold, two houses, Nos. 101 and 102, Lisson grove, North, producing £91 per annum, term 24 years unexpired, at £15 15s. per annum—£705.

Leasehold house, No. 9, Cumberland terrace, Bayswater, let at £42 per annum, term 79 years from 1867, at £7 per annum—£365.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Samuel Edward Marples, Ramsgate, architect, April 15, at 1.—Thomas Livewell Neave, North-square, Mile End, carpenter, April 15, at 2.—Henry Pack, 8, Falmouth-street, Stratford New Town, joiner, April 15.—James Paramor, Margate, builder, April 11, at 12.—Benjamin Ryley, Royal Hill, Greenwich, engineer, April 15, at 1.

TO SURRENDER IN THE COUNTRY.

James Bates, Wolverhampton, brick and tile dealer, April 8, at 12.—Philip Harrel, Ugborough, mason, April 9, at 12.—Thomas Jackson, Pudsey, stonemason, April 7, at 9.15.—Joseph Jefferson, Old Accrington, joiner, April 20, at 1.—George Llewellyn, Pontypool, painter, April 13, at 11.—George Winn, Alfreton, builder, April 15, at 12.—George John Bell, Norwich, builder, April 13, at 11—David Watkin, Coychurch, Glamorganshire, carpenter, April 17.—Frederick Young, Brynmawr, railway contractor, April 12, at 11.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

April 23, T. Brading, Ryde, builder.—April 11, G. Hunt, Bury St. Edmunds, plumber.—May 1, G. Lapthorn, High-street, Poplar, master joiner.—May 5, R. C. Rudman, Walmer-road, Notting hill, builder.—May 8, B. Scotting, Shepherd's Bush, builder.—May 1, G. Wood, Mold Green, stonemason.—April 20, T. Eddisford, Heath Charnock, near Chorley, tile manufacturer.—April 22, T. D. Kirkham, Lower Broughton, decorator.—April 14, C. Cotten, Hythe, carpenter.—April 17, J. Scott, Egremont, joiner.

DIVIDENDS.

April 17, J. Taylor, Worsbro' Dale, near Barnsley, builder.

SCOTCH SEQUESTRATION.

Robert and James Carswell Swan, Prospect-hill, near Glasgow, builders.

PARTNERSHIPS DISSOLVED

Birkby and Kelitt, Wike, stonemasons.—Evans and Martin, Penge, builders.—Harrison and D'Hooghe, Darlington, surveyors.

THE BUILDING NEWS.

LONDON, FRIDAY, APRIL 10, 1868.

MANCHESTER TOWNHALL.

ONCE more we find ourselves in Manchester, and once again in front of a room full of designs for its new Townhall. This time our notice is restricted to the productions of those favoured eight architects who were started as a crew to pull for the prize some six months ago, for our readers will doubtlessly recollect that out of the 136 designs sent in in August last, ten were chosen to compete amongst themselves for the honour and glory of building the municipal palace in Cottonopolis. It was found that amongst these ten were only eight men, two of them having sent in two designs apiece. At present the eight beatitudes don't seem to be much quoted amongst them, and the commination service seems to have prolonged itself from the first day of Lent to this, very nearly the last of it, for the—well—not blessings we hear, are, if not loud, most certainly deep. We wonder if ever there were, or if ever there could be, a satisfactory architectural competition. Architects and committees would both need much alteration before that consummation could be arrived at, and it often occurs to us that the French word *concours* is better fitted to express the fact than our own. They use the same word for horse racing, and there is much the same amount of jockeying and hocussing in the one as in the other, and this does not seem to have been an exception. It may be well just passingly to review what has hitherto taken place before examining in detail the plans before us. Just twelve months ago the corporation advertised for plans, and, as we have said, 136 designs were sent in, some good, some bad, and many indifferent; a professional umpire was called in, and those he delighted to honour were withdrawn from view, and, with the exception of some others, who did not choose to exhibit their designs, the rest were exposed to the public view, and on which we commented at some length. Much dissatisfaction was at the time expressed that all the designs, whether temporarily successful or not, were not treated alike, so that those who were beaten might see that they had fairly been defeated, and the successful architects were then challenged to exhibit their designs in this new competition, in order that it might be seen how far they had pillaged from the industry and invention of others. This they have of course not done, and their original designs are still mysteriously hidden. On Valentine's day last eight sets of drawings were sent in from Messrs. Lee, Brodrick, Wyatt, Speakman, and Charlesworth, Salomans, Waterhouse, Worthington, and Scott, junior, and these comprise 126 drawings, on which Messrs. Street and Donaldson were requested to report. This they did after two days' examination, which would allow them about five minutes per drawing, and as a natural consequence their report was so unsatisfactory that they had to supplement it with another; and now comes the strangest part of this very strange matter. Their second report was "a confidential communication," to be kept strictly private, yet read to a committee of upwards of sixty persons! We all know how very private such a thing must be, and each hearer recollects so well the criticism against his friend; and the discord this has produced and the bitterness of feeling it has caused can easily be imagined. The corporation would do wisely even yet to publish this mysterious document at once, for if it is fair they have nothing to be ashamed of for giving publicity to it, and their withholding it seems to imply that it is not so.

Of course Mr. Waterhouse is successful, though from the evidence of the drawings it seems to us a wonder why. His design is very poor—a flat façade, with a low mean entrance, and a horribly ugly tower in the centre, a tower which seems to have no connection with the building from which it springs, and to have but little between the parts which compose it. The composition of the front itself is very faulty, and the windows are, in some instances, placed in utter disregard to structural requirements, and piers come down over voids, in bold defiance to all laws of gravity or art—in fact, this front of Mr. Waterhouse's design is a failure. The other fronts are more successful, but none of them attain eminence in art, and if we come to analyse the design, we find it is more the handicraft than the architecture which commends it. Some of the sketches are exceedingly beautiful, and the little pen and ink sketch of the perspective view from the point demanded by the committee in their instruction is a charming little drawing and a very artful dodge. Its sketchiness reveals nothing and suggests everything, whilst it enables Mr. Waterhouse to supplement his design by a perspective drawing, taken from a more advantageous point of view. Very exquisite is the drawing of one of the internal circular staircases, which have an open and arcaded well-hole. Very few could draw this in such admirable perspective, and none represent it better. Another staircase is also shown, which is a marvellous illustration of how poor a design may be well represented. In execution it would be positively ugly, but as a picture from this point, with all the adventitious aid of an impossible point of sight and extreme elegance of drawing, it is very pleasing. The main hall has a roof of the Westminster Hall type, but instead of showing the rafters the ceiling is curved, following the main line of the arch rib, a change which is not an improvement on its prototype, and the acoustic effect of which would certainly be bad. It is only when we come to the plan that we find anything commendable, and here Mr. Waterhouse has been very successful. It is exceedingly simple; and when the awkwardness of the site is taken into consideration, our professional readers will know how much thought and trouble must have been bestowed upon it to produce this apparent simplicity. By making his main entrance on the ground-floor Mr. Waterhouse obtains two good things. He gets all his steps under cover, and preserves the whole front to Albert-square on the first floor for reception rooms *en suite*. He has, moreover, shown great skill and wisdom in placing the main hall in the centre of his sill, and not ranging with the centre of his façade, a point not seen by any other of the competitors, and which gives him greater and more equal open space for ventilation; and by raising the ground floor a few steps he maintains a continuous corridor on the ground floor, and yet obtains a cartway and ready means of access to the basement. These corridors form a continuous ambulatory around each floor, and have the circular staircases before alluded to at each angle, giving ready access to all divisions of the buildings. To obtain all this Mr. Waterhouse has encroached somewhat on the space allowed for the buildings, and thus obtains one advantage over those who have complied with the conditions, and at which some of them take what seems to us reasonable exception. Altogether Mr. Waterhouse's design does not please us. It has great merit in parts, but wants much more thought and consideration to make it a perfect whole, and will require quite as much alteration as some of the others would do before it or they could be fitted for its purposes.

[On account of going to press a day earlier than usual this week, the concluding part of this article came to hand only just as we were going to press, and must therefore be postponed till next week.]

RECOLLECTIONS OF THE PARIS EXHIBITION.

IN the statistical introduction to the catalogue of the British section of the Paris Exhibition, a remarkable document, issued from beneath the shadows of the new boilers at Brompton on the 1st of April—(appropriately enough, as some were wicked enough to think)—is a table showing the number of persons engaged in domestic service, and in all the principal industrial operations of the United Kingdom, according to the census of 1861. From this we learn that the fourth great industry of this country is building—standing in that position relatively after "service" (domestic and agricultural), "dress," and "cotton." If we add to these numbers engaged in building operations purely, those set down under the head furniture, without recording the various trades and industries which contribute materials for the builder's use, such as lead, iron, glass, &c. ("stone and clay" alone counting for a very large number), we find that cotton itself must yield its place and give way to the builder, who thus takes rank as third in the list of industrial operators, following only the great staple headed "dress," which ranks next to domestic and agricultural service, the term under which the largest number of all working individuals, men and women, are included. Now, although it is only with the comparatively small proportion of workers in this industry which can be deemed artistic, and the small amount of their work which can be recorded amongst the fine arts, to which we now desire to refer, still, as a little leaven leavens the whole lump, so does the work done by this minority, and in this infinitesimal proportion influence for good or evil, both artistically and constructively, the whole mass of building works carried out in the United Kingdom. Thus the importance of this matter, of the good or bad architecture of the age, shows itself in connection with any comparative exhibition of the arts and the industries of the period. With this point in view it is not unprofitable to enquire before the opening of this year's exhibitions, what results from the great display of last year are evident and patent to all, or what has been lost of opportunity, and how far our coming exhibitions, though on no world-wide competitive scale, may profit by the experience of last year's failures.

Whether South Kensington profited by the statistics gathered by themselves, and gave sufficient prominence to architecture in the Exhibition, and whether it would not have been preferable to have had the architectural drawings properly hung at the opening of the Paris Great Exhibition, instead of devoting so much care to placing prominently in position the case of old newspapers and such like fidfads, let those more directly interested in the matter say; but what we think is that the important series of drawings sent to Paris deserved better treatment at the hands of the authorities, even if the names of those sending them were not sufficient to ensure it. The small space in which these works were huddled together, not in the Fine Art ring at all, was disgraceful to those who had the disposal of the space, and we are informed that a definite application for more was definitely refused.

Whether the combination of the Art Manufactures Court with the exhibition of architects' designs was practically of advantage to architects may be a moot point, but there can be no doubt that it was highly distasteful to the South Kensington authorities, and that it suffered accordingly. At any rate, it seems by the report of the Paris Exhibition Architectural Committee, just issued, that the combination was more or less satisfactory to the promoters, inasmuch as they do not deprecate any similar arrangement at any future time, though bewailing the troubles attending it in this instance. It, however, it was an advantage to the works of art industry to be placed so near the fine arts as to occupy the outer wall

enclosing that ring, it was hardly so for the Fine Art itself, which was placed beside it, when it ought to have been within the proper circle, and, indeed, it was scarcely fair to deny to the architecture of Great Britain alone of all the architecture exhibited a sufficient place in the range of the Fine Arts; but when it is considered that the number of all the drawings and models exhibited through this committee amounted to more than all those exhibited by other countries put together,* France alone excepted, of course, an excuse may perhaps be found in the impossibility of providing adequate space in a proper position for such an important display. At the same time it may be deemed an honour to British architecture to have taken up so determined and definite a position with regard to practical work, and shown more designs for actual buildings, &c., than all the rest of the world, France even included, and altogether to have made a satisfactory show of architectural designs both as exhibited in drawings and in works of a more substantial character. (See the before-mentioned table.)

If we look upon the special style of French drawing in contradistinction to that of our own, we may not find a reason for this curious fact, that the French prefer to show "Projets" and ancient studies rather than executed works, but we may at least ask if the executed works of France do not suffer from the too careful attention to draughtsmanship, the liney elaboration of delicate ornamentation, the monotonous, care-taking symmetry of parts which is the result of paper-planning and drawing-board decoration. On the other hand, is not the vigorous, bold—coarse, perhaps, often wanting in refinement—but strong drawing and colouring of our British delineation better adapted to show the actual form and appearance of the buildings, and to lead the designer himself to approve and provide more variety, light and shade, boldness and vigour in the actual work? And for the purposes of *exhibition* is not the latter style more desirable after all, if the object be to interest the public in the works of architects? for, even to the professional man, it takes some time and imagination (besides the examination of the plan) to understand the effect of an elevation, and to the unprofessional visitor it is almost impossible, while a good perspective drawing properly shaded, and with the materials truthfully coloured, is surely of the highest value as an architectural study. Yet it is the fashion to deprecate such exhibition drawings as if they were never got up except to deceive, and to praise the French style of delineation, and speak of mere elevations and plans as if technical draughtsmanship was the object, and not architectural representation.

Now, for the Royal Academy to exhibit merely such technical drawings would be absurd, and nothing could lead less to popularise architecture. Then who was right as to the kind of drawings exhibited, France or England, in the Paris Exhibition? where all the world was invited to see, amongst other things, the architecture of the period pre-eminently before the draughtsmanship. All this has a bearing upon the daily work of architects, as well as on all exhibitions of architecture, and we commend it to the consideration of all who may have any concern in the matter; but we wish emphatically to assert that to draw—even the figure—is not to design, and to make archæological drawings is not to conceive fit architectural clothing for the every-day building wants of the nineteenth century.

But for the Architectural Exhibition to take up the special line of technical delineation in combination with popular—though not on that account useless—representation of buildings and designs, is perfectly right, and indeed obligatory; for therein consists the life, the *raison d'etre* of the society itself, and a cause for increased opportunities of usefulness, even when the Academy shall be enabled to offer space on its walls for a proper exhibition of architectural works; and if it should unfortunately turn out that the Academy still looks coldly on one of the arts which it is established to foster and encourage, the Architectural Exhibition Society will still remain to shelter and protect, if not to honour and adorn, the neglected sister of the arts. It would then become the pride, as well as the duty, of the managers, to see how far they could extend the popularity as well as the professional usefulness of the extensive collection of drawings and photographs which yearly they offer to the inspection of the public.

We shall look with anxiety at the position which this society will hereafter assume, and we venture to predict for it—if only true to its purpose—a future of extended usefulness, instead of apprehended dissolution. At the same time, if eclipsed in its displays, or deprived of its resources by the all-absorbing power of a regenerated and enlarged academy, we shall not regret its extinction, but remember its period of existence with all gratitude, honour it for its usefulness in the day of its power, and recollect it as having risen up to perform a duty neglected by another to the best of its opportunity and ability.

* Comparative Statement of the Exhibits in Architecture at the Paris Exhibition of 1867.—Under the head of "works" are included all designs actually executed or in execution; while under the other head are included all mere studies; designs only proposed for execution, restorations of buildings not intended to be carried out, &c., &c.

* A much larger number had to be rejected for want of space.—*See Report.*

THE EARTH SYSTEM.

WHETHER the earth system is destined to be the one generally adopted for sanitary purposes we must wait to see. At all events every day's experience proves that the water system is very far from perfect. It is, in truth, open to objection on many grounds, as its warmest advocates cannot but admit. If it cures certain evils, it creates others which are just as bad in their effects. Four years ago the Committee on the Metropolitan Sewage stated in their report that no efficient artificial method had been discovered to purify, for drinking and culinary purposes, water which had once been infected by town sewage. And this fact remains. By no known mechanical means can such water be more than partially cleansed; it is always liable to putrify again. Processes of filtration and deodorisation cannot, therefore, be relied upon to do more than mitigate the evil. Water which appears perfectly pure to the eye is sufficient, under certain conditions, adds the same report, to breed serious epidemics in the population which drinks it. That the present system of sewage is defective, unsatisfactory, and, in fact, attended with positive injury to the public health, though its primary object is to subserve the ends of health, it need not take long to prove. The evidence at hand is abundant and conclusive. For example, no fewer than 100 cases of fever at Tottenham were distinctly traced to the water from the sewage works that irrigated the fields in the neighbourhood. And the Registrar General has shown that 78 per cent. of the deaths has been due to the use of water rendered impure from the presence of sewage matter. Though irrigation and water-closets are advocated by Mr. Rawlinson, Mr. Latham, and other sanitary engineers, the system is strongly condemned by other authorities, including many eminent medical men. Dr. Hawkesley observes that "the great fault of the irrigation system is, that it leaves unredressed the crying evils of polluted air and water. The drains and sewers remain exactly where they were—an enormous laboratory of pestiferous gas, and the deadly adulterators of our water. Under this system the double and treble mortality must go on—the degeneration of the human constitution—the spoiled homes of our labouring classes." Dr. Macadam says, "The irrigated meadow is not so healthy as ordinary pasture land." Dr. Carpenter, of Croydon, Dr. Buchanan, Dr. Capelli, of Italy, and others, also report against the system. Mr. Thorwirth, of Berlin, though an advocate of irrigation, yet recommends that "the lands to be irrigated should be a mile or so away from any human habitation." More deaths and illness, it is proved, occur along the line of great sewers than elsewhere; and facts also prove that irrigation is really noxious and pestilential. As to sewers, Mr. Bazalgette remarks that they "should have free ventilation into the open air, or the gases generated in them will escape through the untrapped house drains into the houses, where they become dangerous and offensive." Of course they must be ventilated in order to be cleansed and repaired. But the difficulty of trapping sewers is very great. Mr. Hayward, engineer of the City of London, describes the difficulty as "gigantic." In his evidence before the House of Commons he confessed himself unable to suggest any better means of ventilating the sewers than are used at present. "I am afraid," he said, "that we must let out the stink in the middle of the streets." What the effect of this is on the public health need not be told. The epidemic in Washington, in 1857, was clearly traced to the escape of gas from sewers; and so late as last year a sewer in Philadelphia absolutely exploded from the accumulated gas. The case of Croydon is constantly cited as an example of successful irrigation, but though Croydon possesses peculiar advantages as regards the application of the system, the result afforded is after all only partial. The farm at Croydon, it is stated, comprises 312 acres, the crop raised on which brings annually £1,800, but then the value of the sewage passed over it is £17,500; therefore, seven-eighths is wasted, and the air and water are poisoned in that degree. Medical men assert, with regard to water-closets, that since their introduction, owing to the lowering effect of the poisons emanating directly and indirectly from them, the type of disease has been altered, and has become more dangerous. The three great objections to the wet system, then, are, first, its noxious effects on health; second, its expensiveness in the matter of water-works, pumping-engines, straining-tanks, &c.; and, third, its wastefulness. With these facts before us, it is not surprising that we should turn our attention to the earth or dry system, for a remedy for the evils from which

we suffer. The merits of this system have received a great deal of discussion lately, and it must be confessed that the advocates of the plan are able to say much in its favour. A very sensible little pamphlet has just been published by Messrs. Spon and Son, of Charing Cross, on this very important question. The writer strongly advocates the adoption of the earth system, and replies to the objections that have been made to it. There can be no doubt that a dry system is *primâ facie* consistent with nature. The use of earth was under certain conditions commanded in the Scriptures, Deut. xxiii., 12, 14. The power which earth possesses of deodorising fœcal matter is indisputable, while the application of water to human excrement favours its decomposition. "It is proposed in this system," says the writer, "that the soap and household water shall be carried off in ordinary rain drains, to be applied to subsoil irrigation, thus avoiding all the evils of pollution, both of air and of water." Again, "the earth method has this great advantage over the sewage system that, although the liquid must be discharged at all times and seasons when the tanks are full, the earth may have its fertilising property increased to almost any extent, and may be stored dry in sacks, and transported to any part of the country as necessity arises." To the objection that the requisite amount of earth for the effective employment of the earth system is so great as to render its application in large places impossible, it is replied that contractors have offered to supply the quantity that might be requisite for any part of London. It would not be attended with anything like the cost of the present method, and, finally, it has been tried with the most satisfactory results. The earth system has already been adopted in public unions, of which may be mentioned Caister, Bradfield, near Reading, Frome, Bromley, Horsham, &c., in barracks, in the Royal Infirmary, Manchester, and in Broadmere Lunatic Asylum; and of its working in Wakefield Gaol, Captain Armytage, the governor, so late as December 26 last, expressed himself as being "perfectly satisfied." The system has also been tried on Baron Rothschild's estate, in a village containing 800 inhabitants, and the Baron's agent, in a communication (as late as December 20 last) expresses the following opinion:—"In practice, the system is so wholesome, simple, and inexpensive, that no one who tries it properly would ever desert it for the water method." Earth-closets and urinals have likewise been adopted in Dorchester County School, where there are about 80 boys; in Brighton Barracks, for 200 men, besides other places, with like success. Ample testimony to the great value of the system has also been borne by the Government of India, which, as is well known, awarded the Rev. Henry Moule £500 in token of its sense of the benefits conferred upon the inhabitants of that country by his system. These are facts which are simply indisputable, and surely they deserve the careful attention of all sanitary reformers.

CONTINENTAL ART.

MR. J. BEVINGTON ATKINSON, in an article in the *Contemporary Review*, on "Art in the Paris Exhibition," gives an interesting account of the condition and characteristics of modern continental art. At the Exhibition the picture galleries as usual excited most of popular interest. 2,116 representatives of some twenty-six national schools constituted as it were a vast and crowded panorama of the contemporary art of the entire world. Six schools or geographic groups could be distinguished.—1, the French; 2, the Belgian and Dutch; 3, the German; 4, schools of southern nations, including Italy and Spain; 5, schools of northern nations, comprising Norway, Sweden, Denmark, and Russia; 6, the English school. The sketches given of each indicate indirectly the conditions of the respective peoples and the phases of civilization. The arts are essentially representative; they pass easily into manufactures and diffuse themselves willingly over life, and thus in their various manifestations become typical and illustrative of countries, climates, and races.

The French school of painting was again proved to be the first in Europe. According to Mr. Atkinson, the arts in France, in common with governments and dynasties, have undergone changes and revolutions. French artists have passed from classic to romantic styles, and thence downwards into such naturalism, realism, or frivolity as may belong to rustic scenes, or to incidents of the toilette and the boudoir. The school of David and his disciples, co-existent with the First Empire, the abnegation of life and nature, could not withstand the assaults of ardent realists and romancists led on by Gericault. The French school reached its zenith under Delaroche, Delacroix, Ary Scheffer, and Flandrin. The period is best represented by the works of Delaroche. He was the reflection of his age; he responded to the impulses freshly awakened in literature and art. The overthrow of usurped authority, the renunciation of dead tradition, the renewal of national life in Europe, the health and vigour gained by recurrence to nature, made the school of Delaroche a product and necessity of the time. The strength of this school was its truth, its health was in freedom, its productive resource was in nature. According to it high art was nothing else than noble thoughts nobly expressed. This style the French have surrendered for pictures of nudity or costume; this school, honourable to humanity, foreign nations, to the shame of France, are the last to uphold and honour.

French art is described by negations—large pictures do not abound, high art is exceptional, works of noble intent are few. The positive side of the school remains to be illustrated. No nation can beat the French in the painting of a battle. Since the days of Horace Vernet battle-pieces have become specialities in Paris. Our neighbours are just the fellows either for a skirmish in the field or on canvas. An artist is as indispensable to the grand army as a drummer or a chaplain. War in its bravery, carnage, and brutality is celebrated by not a few—among them, Yvon, Pils, Bellangé, Beaucé, Beaumé, Rigo, and Protais. It is surprising what movement, energy, and passion animate these desperate onslaughts. They are clever, realistic, and vivid. They cannot, however, be too strongly reprobated for their inhumanity and barbarity. The French talk of the glory of war, and their painters are glutted in its carnage. The first Napoleon decided for Europe the tactics of a campaign, and Horace Vernet has equally determined for the whole world the style in which battles shall henceforth be painted.

As before said, since the death of Delaroche, Ary Scheffer, and Flandrin, high, historic, and sacred art has been less and less practised. Romance, voluptuousness, elegant trifling, these are now the motives and ends of French art; these the sentiments and desires to which are due the brilliancy and allurement of Parisian picture galleries. In French pictures now the vogue, cleverness takes the place of conscience; the diction, rhetoric, and elocution, so to say, of art, are studied to the disregard of substance and truth. Gérôme is precisely the man to fulfil these conditions, and, consequently, he has become the fashionable artist of the day. The morality of his pictures, "Phryne" and the "Egyptian Dancing Girl," is not the less culpable because, after the manner of the French, passion wears a thin veil of disguise. That it was possible for Gérôme to have walked soberly, to have trodden with honour the highway of history, is indicated by such noble works as the "Dead Gladiators" and "Dead Cæsar." In art treatment, and for mastery over every technical method, it is needless to say, Gérôme has scarcely an equal. His drawing is academic for precision: his touch is only less brilliant than that of Meissonier; the intellectual conception of his subject is clear, wit sparkles on his canvas, indeed the keen edge of satire often bites malignantly. That an artist so singularly gifted should make the outrage of taste and morals his deliberate intent must be taken as a grave comment on the manners of the Second Empire.

The transition from Gérôme to Cabanel is easy. The license of the French stage, the intrigue of Parisian *salons*, the dissoluteness of works of fiction, are inevitably reflected in the pictures of artists meant for better things. The French can paint a woman, but not a goddess; their nymphs are grisettes, their Magdalens repent of repentance. It has long been the creed of the French Academy that the drawing of the nude figure is the acme of art, the last pledge of talent and trained skill. Ingre's "Odalisque" and Flandrin's "Fisher Boy" have been for many a year famous as faultless models of the male and female form. The excuse in justification of such performances is supposed to be in their treatment. And surely minds the most modest cannot be shocked by the Elgin marbles, and modesty herself might take a lesson even in Paris, in the presence of the Venus of Milo. Cabanel and his compeers, however, would scarcely care for anything so quiet. A certain æsthetic sensuousness, which the French affect greatly, seems as it were to reach its quintessence in Cabanel's "Venus," tossed ashore on the top of sea foam.

It must be counted an ill omen when a gallery is conspicuous for "genre,"—a term to designate a nondescript class of pictures. Tableaux de société are sure to be feeling and clever among a people who live less in private life than public places, who make etiquette and deportment parts of scholastic training, who believe that attitude and address are everything, and that manners make the man. Positively there are no more sparkling pictures in the whole world than the small cabinet works of Meissonier, Plassan, Fichel, Vetter, Toulmouche, Duverger, Frère, Hillemacher, and Leleux. Meissonier, like others of his countrymen, by his treatment gives to the most trivial subjects importance. Among the other artists above enumerated Plassan deserves to be singled out as especially French. He is fond of painting a girl at prayer by her bedside, for the sake, it would seem, of the demi toilette, excused by the situation. Toulmouche also bears the unmistakable traits of a Frenchman—address *savoir faire*, polish *aplomb*. It is no disparagement to say that French artists would a thousand times rather be frivolous than heavy and dull. French art, indeed, is too apt to treat life as a jest, society as a comedy—hence pictures too frequently have no more substance than vaudevilles at *Le Theatre des Varietes*.

In what may be called the school of naturalism, Hamon, Breton, Millet, Bonnat, Hèbert, Ribot, and Rosa Bonheur are pre-eminent. Hamon's "Aurua," a graceful figure sipping morning dew from flowers, is well-known. Breton and Millet are rustic and rude; the peasants they paint have never seen a city, they are children of nature. The French are not likely to be outdone in this or any other branch of the art. They lead in battles, are at ease in boudoirs, and at home in the home of the peasant. Rosa Bonheur's fame is well known. It may be observed, however, without detraction, that the more that is known of animal painting in France the more evident it becomes that she does not stand alone.

It only remains to speak of French landscape, to the surprise of the whole world lately strangely exalted by the International Jury. French landscape painters do not show themselves over ambitious in the choice of subjects. They seldom aspire to a mountain; for the most part they rest content with a marsh, a moor, a common, or a wind-stricken tree. Certainly they cannot be said to compass the whole of creation. Rousseau, Daubigny, Francais, Lambinèt, Huet, Combet, Cabat, Carot, are all limited in range and effect. They paint poetry with a heavy brush; pigments they load on thickly with a clumsy hand; light they mingle with over-much shadow; colour is toned down with dirt; so that often the most brilliant of successes is but the solution of the problem how to make the darkness visible. The French figure school is the first in Europe; the same school in landscape receives ample justice by a place in the second rank.

The Belgian Gallery at the Exhibition contained 186 pictures, representing seventy-five painters. Belgian painters are, in more senses than one, national; they give pledge of sincerity and fidelity in the choice of subjects which lie near to the homes of their fathers. Thus there is much circumstantial reality and power of persuasion in Ley's picture of the "Burgomaster Lancelot Van Ursel Haranguing the City Guard for the Defence of the City." The same painter, in works taken from the lives of Luther and

Lucas Cranach, identifies himself with Protestantism. His style, too, is of the period of the German Reformation, and has much in common with the manner of Holbein, Durer, and Cranach.

Holland built to herself a separate gallery, which at once ensured the isolation and prominence of 170 pictures. Modern Dutch art is near akin to its ancestry. Yet it must be admitted that the painters of Holland are within their narrow limits singularly complete. One painter can be named, Alma Tadema, who proves the possession of originating power. His aim is to restore the domestic manners of the ancient Egyptians, Greeks, and Romans. His genius is essentially northern; that it should have been cast as a waif and stray on the shores of Holland, is passing strange. One element he has in common with the Dutch, that of technical excellence and skill.

The German school, which comprises representatives from Austria, Bavaria, Baden, Wurtemberg, Luxemburg, and Hesse, contributed 437 pictures. In Austria art, refusing reform altogether, goes on slumbering still, conservative and stagnant. The Prussian gallery presented a striking contrast. Kiraus is perfect in his way. A broad Hogarth truth which stops just short of caricature, the power to tell facts by a touch, and to clench characters by a stroke have secured to him pre-eminence. Bavarian painting was required to conform to the conditions imposed by architecture, but a change is impending. Piloty, the realist, now rules the young school of Munich. This clever painter has been for some years known to Europe by his "Death of Wallenstein" and "Nero amid the Burning of Rome." He paints for effect. Piloty, the realist, is expressly an artist for the present times. German art has changed its sphere and style, but it cannot cast off its national idiosyncracy. It may cease to be grand, but it still remains ponderous. A German painter elaborates a picture as a professor might propound a problem in "Euclid." Yet the productions of the Teutonic intellect are almost as a matter of course scholarly, academic, and right minded. It is, however, not a little strange that a people with whom æsthetic culture has been a hobby should in the application of the science to actual art want subtlety, sensitiveness, and even an eye for beauty.

The arts in Italy and Spain, Greece and Portugal are but reflections or shadows of the past. Lisbon, with less to lose than Athens, finds herself in like miserable plight, and so Portugal and Greece may be blotted out altogether from the chart of European arts. Among Italian cities Florence, as of yore, takes the lead. Florence lives in the naturalism of Masaccio, Venice dotes on glowing memories of Titian and Veronese; and the reckless Neapolitan of the present day paints with the savage rudeness of Caravaggio and Ribera.

The conditions conducive to high art still subsist in Spain. Her vigour and resource promise the resumption of her ancient position. In the Spanish gallery at the Exhibition were two of the grandest interiors ever painted; the one solemn in that gloom which is the glory of Spanish Gothic, the other the Sistine Chapel. Spanish figure pictures have the dramatic force, breadth, and shadowed solemnity which pronounce with national character the pictures of Herrera and Velasquez.

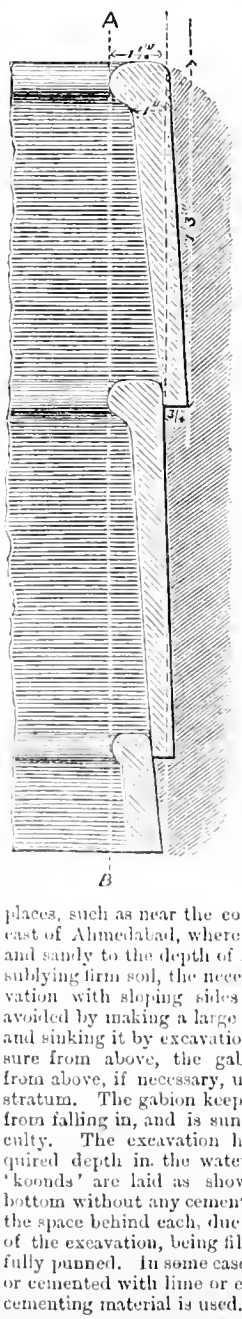
The Latin races that first caught the light of knowledge as it dawned in the east, now dwell in half shadow, and the lands peopled by the Celt, the Saxon, the Gaul, and the Slavonian find that the sun inclines to northern latitudes. The arts have assuredly found their way to the banks of the Neva. Yet Russia has no distinctive art nationality. She does not create, but she borrows wisely: her school, if not a copy, is at least a compilation. Of Denmark it is impossible but to speak disparagingly. The contemporary art of Copenhagen must be pronounced unworthy of the land that gave birth to Thorwaldsen, to Oersted, to Worsae, and to Andersen. The honour of Scandinavia is, however, safe in the keeping of Sweden and Norway. The art products of these sister kingdoms at least inspire respect. The school of Tidemand, who is to Norway what Wilkie Webster and Faed have been to Scotland, makes a faithful chronicle of humble peasant life. There is much that is independent and outspoken in the art language of these peoples espoused to Protestantism. The church as a church seldom makes her presence known; the state collectively in ceremonies or pageants does not intrude; but man, the unit, or rather the master of his house and home, stands upon canvas ready to assert such human rights as belong to honest industry or bravely borne poverty.

We have, in this abstract of Mr. Atkinson's paper, freely used the author's words without qualifying them with any criticism of our own—a task which we may perform ere long.

"KOOND" WELLS.

THE *Bombay Builder* contains the following observations on "Koond" wells, which will be found interesting to English readers:—"It frequently happens that people would be glad to have wells in their compounds, but the cost of a permanent one is beyond their means, and a 'kutcha' one is always more or less unsatisfactory. The object of this article is to explain a simple and very cheap way of sinking wells, of small diameter, it is true, but which will amply suffice for irrigating a good large garden, and for all purposes, except where an exceptionally large supply of water is an object, as in the case of factories, mills, &c. The system is, as will be described, equally applicable to wells of large diameter, but where such are necessary, the funds for their construction with the usual masonry steening are generally forthcoming.

"'Koond' wells will possibly be familiar to some of the readers of the *Bombay Builder*; but the greater proportion will, in all probability, have never heard of them. The method of constructing them is well known in Guzerat, and is one of many wrinkles which engineers will do well not to be too proud to pick up from the natives.



"'Koonds' are cylinders of the usual native pottery, handmade, carefully burnt, and of a rather peculiar shape. The sketch in the margin represents a section through a portion of one side of the lining of a 'koond' well, showing the dimensions and shape of the cylinders (or 'koonds'), and the manner in which they are set one above the other. It will be observed (vide vertical dotted line A B) that, from the taper given to the 'koonds' during the moulding, the full diameter of the well is preserved from top to bottom. In sinking one of these wells in firm soil, and where the greatest depth to be attained is not more than 40ft., the excavation is carried down, with a diameter a few inches greater than that of the 'koonds,' without any lining, the last few feet being in the water-bearing stratum, and the water being kept under by leather baskets plying from a windlass above, or by a 'kos' and pair of bullocks. In some places, such as near the coast, and to the north-east of Ahmedabad, where the soil is often friable and sandy to the depth of from 6ft. to 10ft., with subdying firm soil, the necessity for a larger excavation with sloping sides through the sand is avoided by making a large gabion of cotton twigs, and sinking it by excavation from inside and pressure from above, the gabion being lengthened from above, if necessary, until it reaches the firm stratum. The gabion keeps the sand or loose soil from falling in, and is sunk with very little difficulty. The excavation having reached the required depth in the water-bearing stratum, the 'koonds' are laid as shown above from top to bottom without any cementing material whatever, the space behind each, due to the extra diameter of the excavation, being filled in with earth carefully punned. In some cases the joints are pointed or cemented with lime or clay, but in general no cementing material is used. In this way a neat and useful well is sunk very cheaply, and will last for many years.

"Wells of entire 'koonds' (or cylinders), as described above, are rarely made of a greater diameter than 3½ft., their usual diameter being from 2½ft. to 3ft., which is quite sufficient for the working of the bullock 'kos.' Where wells of a greater diameter are required, the system is somewhat different. It would naturally be a most difficult matter to burn larger cylinders without warping and cracking, and they are therefore, soon after being moulded, cut vertically into a number of vousseirs (as one may say), which are set in rings, from bottom to top, breaking joint, the diameter of the well being, in construction, slightly reduced to ensure the firm wedging in of the last vousseir in each ring, thus obtaining the greatest strength possible to resist the inward pressure of the earth tending to rupture the 'koond' lining."

CATHEDRAL ARRANGEMENTS.

AT the last meeting of the Worcester Diocesan Architectural Society, Mr. Beresford Hope read a paper on Cathedral Arrangements. He said that he would not detain the company by any lengthened prologue, but at once enter on the subject of "Cathedrals and their Arrangements." The fine old cathedral of Worcester was now undergoing restoration, and, various opinions being entertained as to that restoration, he should say as little upon that matter as possible, or else he might put his head into a wasp's nest, and therefore he proposed to speak on the general question. However, if anyone present should put his head into the cap which he (the lecturer) provided, it would not be the lecturer's fault. For himself, he would much rather have been addressing an audience in a town where a cathedral ought to be built—say Birmingham, for instance—and stirring them up to the good work, for we wanted more cathedrals in England. We had been building numerous gaols, but no cathedrals. The popular idea of a cathedral was that it was a large church, with a great deal of carving, and painted glass, and so much space that no one knew how to make use of it; whereas not one of these features was essential to such a building. An *ecclesia cathedralis* was a church in which the bishop's seat was fixed, and that was essential to a cathedral. He was addressing them, of course, as Church people—as an Episcopal community—as members of the Church, in which were the three orders of bishop, priest, and deacon. The cathedral should be regarded as a most perfect and complete building, devoted to the service of God, in which due place and room enough could be provided not only for every order of the clergy to officiate, but for large congregations of the laity. People were too apt to deal with a parish church as if it were a unit in the ecclesiastical system, and to look on a cathedral as a splendid exception, greater and grander than a parish church, and to a certain extent superfluous; but he would start from a different point of view, as the whole history of Christian antiquity ran counter to such a theory. The bishop and his cathedral church was, in truth, the centre of the ecclesiastical system, and the parish churches were, in fact, only offshoots of the cathedral—deputies of that great church—representatives of that building in which Christian truth was first preached, but which building, as Christianity progressed, could not be used as a place of worship for the whole diocese. If they went back to the primitive Church they would see that the centre and moving principle of the system was the bishop and his clergy, acting in and through the cathedral for the worship of God, and the discipline of the people committed to their charge. Parish churches should be imitations of cathedrals as far as they could be, but both should act and react beneficially on each other so far as the conduct of the services was concerned. But a cathedral was greater and better than a mere building—it was an institution. The finest church in the world would not be a cathedral, unless the bishop's chair was there; but the humblest church would become a cathedral with that addition. The bishop and his chapter were necessary to the great idea of a cathedral as an institution; and a cathedral would be untrue to its character and purpose if it did not contain adequate space set apart for its clergy and for the due performance of Divine worship. As to the origin of cathedrals, the records before the time of Constantine were uncertain and scattered; but when, under that

Emperor, Christianity became tolerated, the *basilicæ*, or Roman courts of justice, were used as Christian temples. The heathen temples were not at first used for Christian worship, but were still required for the rites of Paganism, which for some time went on side by side with Christianity. Mr. Hope described the arrangement of these *basilicæ* when converted into Christian temples. There was the apsidal or east end, around which sat the bishop and clergy, with the altar before them. The celebration of the Lord's Supper was the great bond of union to the early Christians, not one of whom would have considered the Lord's Day duly observed without participating in that holy rite. The altar was usually covered with an elaborate architectural canopy, and on the apse behind it was in many cases a mosaic picture representing Our Lord in Judgment, the Lamb of God, or some apostles and saints. The word nave meant a ship, being symbolical of the Church as an ark floating on the troubled waters of this life; and the cross form was observed in the first Christian churches built, and universally recognized as the appropriate symbol of the believer's faith in Christ crucified. At Constantinople other forms also prevailed. The apsidal east end was subsequently abandoned, and the bishop and clergy were seated in the choir, as at the present day. Some still thought the primitive arrangement was best and most solemn, when they sat in the eastern semicircle. Others were of opinion that the bishop and clergy taking up a lower position in the chorus cantorum was a salutary thing; but this and the other usages of the Church we now took as they were handed down to us. The Prayer Book, the liturgy in which had been reformed last in the time of Edward VI., had also been accepted to the present time, and our cathedral arrangements ought to have been reformed as well as the rubric and liturgy, for cathedrals now stood in the same relationship to those of the Middle Ages as the Prayer Book did to the service books before the Reformation. The existing arrangements agreed with the ancient ones so far as having fixed stalls for the clergy, but what they differed in was this: the Roman service was in Latin, and the people could not be expected to follow it. The communion service, or the mass, was the one central thing around which all the other services clustered. These services were called the "hours," because of different services being assigned to various hours of the day and night. Being said in Latin they were sealed to the laity, who usually only attended the mass. There was a multiplication of these masses, for a superstitious veneration of relics had led to the erection of numerous altars. The removal of this superstition and the translation of the services into English was a part of the work of the Reformation. The "hours" were thus converted into short services, which every worshipper was enabled to follow, and thus the Prayer Book was made. Of course there could be now but one altar in a church, except, as at Hereford Cathedral, where the lady chapel was a separate parish church, and had an altar to itself. A cathedral might be considered under two heads—those parts of it which were for use or necessity, and those for dignity or ornament. Gorgeous roofs, pillars, and arches, towers and spires, flying buttresses and pinnacles, and transepts, all these were ornamental, but not essential to a cathedral. The lecturer here referred to a large ground-plan of Worcester Cathedral, pointing out its various parts. The double transepts, he said, originated with the Monastery of Clugny, in France, and took deep root in England, as shown by the many cathedrals in which they existed. A square east end was now much more common than an apse. Triforium meant a gallery, or thoroughfare, above the arches of an aisle; and clerestory meant clear of walls, and capable of being pierced with windows. He next came to consider how a cathedral should be arranged in the most dignified and practical way for the service of Almighty God and the due accommodation of clergy and people. To begin at the east end: in parish churches, where there was not more space than was actually required, the altar was necessarily placed close to the east wall, but there was no necessity for this in a cathedral, which admitted of a chapel or ambulatory behind the altar, putting the latter in a more prominent and elevated position. Indeed, it was necessary that the altar and its approaches should be so raised above the rest of the building, in order to confer on it more dignity, and that what was done there might be seen throughout the choir. To prevent the altar appearing naked and undignified, it should be supported by something architecturally ornamental, and hence the reredos. The Dean of St. Paul's had consented to admit a canopy or lofty structure on marble columns, with a kind of pediment or cupola, over the altar in that cathedral. There should be ample space in the sacrarium for the free action and passage of the bishop and clergy on all occasions, also for communicants: and in all cases the sanctuary should be approached by steps. Sedilia (seats) for the bishop and clergy, and a shelf or bracket for the bread and wine in the early part of the sacramental service, must likewise be provided. And then he came to the clergy, or clerks. Their stalls in the choir were not always filled by them, but frequently might be seen in those stalls a large display of coloured bonnets. Now if the Queen alone had a right to sit on her throne, if strangers in the House of Commons were not permitted to trespass one inch beyond their own boundary, if our Corporations and other bodies observed the same formalities, surely in the House of God everything should be done decently and in order, and the stalls should be preserved rigidly for those for whom they had been intended; and, although there might be more stalls than were required by the clergy on ordinary occasions, it should be remembered that a cathedral was built for the highest purposes, and that there were such occasions as choir festivals, diocesan synods, ordinations, &c., when every seat would be wanted. He was for sending all the coats and bonnets into the nave, and retaining the surplices in the choir. A lectern might be placed just inside or just outside the screen which divided the choir from the nave. From that point the reader would be well heard; but there should certainly be a pulpit in the nave. There were two kinds of sermons, one in which the bishop might have occasion to address his clergy, and this would be in the choir, but the other for general purposes in the nave. King John's tomb, in Worcester Cathedral, he did not consider to be ornamental, but, as it was there, he would not advise its removal. The bishop's throne had always been on the south side of the choir. As to the choir screens, some time ago it was thought that the removal of organs, screens, and everything else, so as to give an uninterrupted view from east to west, and to make a desert in which a coach and six could be driven, was the most desirable thing; but a better taste and a sense of what was right and decidedly more beautiful now prevailed. The screen projected for Worcester Cathedral was beautiful; still he would rather not have servilely imitated the prevailing style of screen, and would have preferred a specimen he had recently seen, which was carried up to and terminated in a gallery, but was of such light and open work that neither sight nor sound was impeded. As to the nave, the question was how best to accommodate the worshippers. They might have either chairs or benches, but if chairs they should be broad, and not fastened together with a strip of wood. Moveable benches, however, were better. The font should be at the west end of one of the aisles, screened off in a kind of baptistry chapel. The lecturer then spoke of the external buildings incidental to a Chapter, and especially commented on the necessity of a Guesten Hall for the entertainment of visitors. (This wicked sally occasioned much laughter.) A great debt of gratitude, however, was due to the Dean and Chapter for the spirited way in which they had taken the cathedral in hand, and he concluded by an earnest appeal to all who heard him to do as much as in them lay for the promotion of this excellent work.

JERUSALEM.

THE latest of the published consular reports to the Foreign Office contains that of Mr. Consul Moore on Jerusalem. From this document some interesting particulars may be gleaned. We learn that the population of the city of Jerusalem is estimated at 18,000, of whom about 5,000 are Mohammedans, 8,000 to 9,000 Jews, and the rest Christians of various denominations. The chief native industry is the manufacture of soap, and what is called "Jerusalem ware," consisting of chaplets, crucifixes, beads, crosses, and the like, made principally of mother-of pearl and olive-wood, and sold to the pilgrims, who annually resort to the Holy City to the number of 6,000 to 8,000. No mines are worked, although it is known that sulphur, bitumen, and rock-salt abound on the shores of the Dead Sea; but security and capital are wanting, and so long as these are absent the probable wealth to be extracted from those regions will remain unavailable. No factories are to be met with. The employment of the people in the rural districts is agriculture, which is carried on in the most primitive mode. It is very satisfactory to be able to report that at length the construction of a carriageable road between Jaffa and Jerusalem has been commenced by the local Turkish administration, a work of primary importance to the material progress of the country, whilst claiming the special interests of Christendom. It is expected that the work will be completed in the spring of this year. It will certainly be an immense improvement on the wretched mule-track that has hitherto done service as the high road to Jerusalem. The value of this improvement would be much enhanced were a harbour to be made at Jaffa. The other roads of the district are of a most wretched description, and, with the want of security, are the main cause of the poverty and general backwardness of the country. Two lines of telegraph, viâ Beyrout and Alexandria respectively, connect Jerusalem with Europe.

THE PRINCIPLE OF CONTRACTS.

A MEETING of the Metropolitan Board of Works was held on Monday, when the tenders were opened for the paving, &c., of the footways, and the erection of fences on the Thames Embankment north, between Westminster Bridge and the Temple. The tenders were divided into A to B, and B to C sections, A to B representing a portion of the western end of the embankment, and B to C the continuation of it to the Temple—viz.:—

	A to B.	B to C.	Total.
From Messrs. Newell and Robson	£7,000 0 0	£2,150 0 0	£9,150 0 0
From Mr. A. S. Gouch	6,960 3 11	...2,160 11 3	... 9,120 15 2
From Mr. E. Thirst	6,729 0 0	...2,290 0 0	... 9,019 0 0
From Mr. T. Turner	7,295 0 0	...2,270 0 0	... 9,565 0 0
From Mr. G. Furness	8,387 0 0	...2,563 0 0	...10,950 0 0
From Messrs. James Knight and Son...	5,742 0 0	...2,193 0 0	... 7,935 0 0
From Mr. A. W. Ritson.....	9,500 0 0	...2,550 0 0	...12,050 0 0
From Messrs. Hill and Keddell.....	6,200 0 0	...1,890 0 0	... 8,090 0 0
From Mr. H. Booth	6,343 0 0	...2,053 0 0	... 8,396 0 0
From Mr. H. Benthall	6,856 0 0	...2,140 0 0	... 8,996 0 0
From Mr. J. Mowlem	6,928 0 0	...1,958 0 0	... 7,986 0 0

The Board then resolved itself into committee, and the public were excluded for the space of half an hour. On their re-entering Mr. Pollard (the chief clerk) read the report of the committee of the whole board, which recommended that the contract should be given to Messrs. James Knight and Son, their tender being the lowest, and only amounting to £7,935. Mr. Freeman moved the adoption of the report, which was seconded by Mr. Fowler. Mr. Savage said that, on principle, he should move as an amendment that, as each contractor had made two separate tenders (A to B and B to C), the lowest one in each case should be taken. For instance, although Messrs. Knight and Son were the lowest by £256 on the A to B tender they were £303 above Messrs. Hill and Keddell on the B to C tender. If the principle of saving the ratepayers' money were strictly adhered to those two contracts would be given to the lowest tenderers in each case. Mr. Legg seconded the amendment, which was put and lost by a large majority.

Mr. Bidgood, on the original motion being put, moved, as an amendment, that Mr. John Mowlem, of Bankside, should have the contract, as his tender was only £51 above the Messrs. Knight's, and he was well known to the Board to be of the highest standing. Dr. Evans followed on the same side, and seconded the amendment.

Mr. Freeman said it was most unfair for Dr. Evans and the other gentlemen who had not spoken in committee to now bring forward such amendments based on such arguments. He said that if the contracts were given in all cases to the largest contractors it would entirely shut out all others from tendering. He was strongly of opinion that the tenders should not be separated. The amendment was then put and lost, and the original motion carried by a large majority.

Mr. Knight was then called in and informed of the Board's choice, after which it adjourned until Friday, the 11th of April.

The death of Herr Vandernnel, architect, Vienna, is announced.

ART EXHIBITION, BOMBAY.

WE have received from the editor of the *Bombay Builder* a catalogue of the Art Exhibition which was opened in Bombay in February last. The idea of this exhibition is due to the Hon. C. J. Erskine, who was president of the Sir Jamsetjee Jejeebhoy School of Art before he left India. It was at first intended to confine the exhibition to the products of the students of that school, but ultimately the doors were opened to contributions from all quarters. On the scheme being definitely drawn out the Government contributed 4,500rs. towards the expenses. It may be said that in 1853 the late Sir Jamsetjee Jejeebhoy offered the Government the magnificent sum of a lakh of rupees as an endowment for the maintenance of art students, provided the Government erected a building and established a school of art. The offer was referred to the Home Government, and after the delays which are usual in such matters, consequent upon the references backwards and forwards, the institution was opened in 1857. From a speech delivered by the Hon. Mr. Ellis, on the occasion of opening the exhibition in February, it appears that this school of art is in a flourishing condition, that it has assisted to foster artistic life, and exercises a civilizing influence over the people of India. If England is destined to hold India, and so become an exception to the rule in the long history of conquests, such means must be used more extensively than hitherto.

The exhibition consists of oil paintings by artists at home and in India, an immense collection of photographs and water colour sketches, including a number of contributions from Major Baigrie, sketched by him in Abyssinia; beautiful specimens of gold-embroidered work from Koolburga; collections of porcelain, and specimens of native art in all its branches. Connoisseurs of jewellery, in particular, have much to feed their eyes upon, for the famous jewel-cloth prepared at the expense of the Gaekwar of Baroda for the tomb of the Prophet at Mecca, and worth it is said about twenty-five lakhs of rupees, is one of the articles exhibited. As another instance, we may mention a magnificent sword and dagger, in sheaths, lavishly mounted with precious stones, and worth, we were told, about three lakhs.

GOTHIC FORMS.

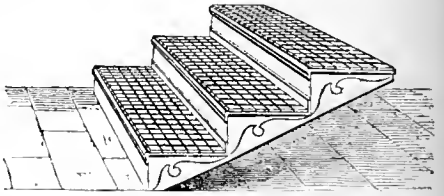
WE have just received the second portion of Mr. Talbert's work on Gothic forms applied to furniture, metal work, &c., for interior purposes. The first portion, consisting of about fifteen plates, was noticed at length in the Building News of July 12th, 1867. The opinion then expressed, that modern Gothic furniture was apt to be overdone, we have seen no reason to modify. The work professes to show how Gothic forms may be adapted to domestic furniture, and it must be allowed that it exhibits considerable skill and much fancy; but that it represents Gothic furniture, such as our ancestors actually used, we may be permitted to doubt. The author observes, "I consider the principal use of the work is, that it may be of a suggestive nature." In this we agree, and cannot but admire the modesty of the remark. Our own opinion regarding Gothic furniture is, that it was very simple: Mr. Talbert's idea is, that it was very florid. The few pieces of ancient furniture which are in existence, such as the cope-chest at Salisbury, the Glastonbury chair, and an aumbry here and there, are exceedingly plain. The very bench-ends in many churches having beautifully carved rood screens are comparatively rough, and it may be fairly inferred that domestic furniture was not more elegant. In the present designs the principal fault appears to be the excessive use of little columns, crockets, trefoils, and quatrefoils, accompanied by too ostentatious a display of construction. In short, all of them would be improved by a little judicious pruning. Plate 17 shows some drawing-room furniture in walnut, ornamented with brass filagree-work, and inlaid with satin wood, all the constructive framing being turned. Mr. Talbert confesses to the difficulty of designing Gothic furniture for a drawing-room, as it is almost impossible to make it sufficiently light, without destroying its Gothic character. Judging from the engraving, the attempt has not been successful. A cabinet of a later period (plate 20) is well worth notice, but the table and stool in the same plate are rather cockneyfied. Plate 21 exhibits a drawing-room, with its furniture complete, and we must confess it does not give us a comfortable impression. From the chimney-piece to the bird-cage it is what the Yankees call too "all-fired" Gothic, and not of a good kind of Gothic; and the same may be said, though in a less degree, of the library interior (plate 22), which recently appeared in the Building News. A writing-table and large book-case (plate 23), and a cupboard, which was exhibited at the Paris Exhibition, are among the best of the designs. A piano (plate 25) is not without grace; and a cabinet (plate 27), for exhibiting objects of *vertu*, will find many admirers. It is, however, in hall furniture that Gothic design tells best. Plate 30 shows a hall table of solid appearance, suited only to a large house. Some designs for tables are also given in plate 28. Here, as in all the other designs, the simplest forms are the best. There is, in this plate, a small folding-table, which is, in our opinion, more truly Gothic than anything in the collection; but the drawing-room table, with columns and carved caps, surmounted by trefoils, is overdone. Mr. Talbert says, "The greatest difficulty to deal with is the drawing-room; there has been little attention paid to the subject, and the requirements are directly opposed to what is generally considered to be in the spirit of Gothic design." And he sums up in these words:—"It is not mediæval furniture confined to the antiquarian knowledge of the past that is wanted, but a recognition of the more honest principles that governed them, substantial work, and ornament, not at war, but having some fellowship with, the Gothic architecture of the present day." These are "brave words" which cannot be gainsaid. Mr. Talbert will in time get over the difficulty.

HONOLULU CATHEDRAL.

ABOUT fifteen months since (Building News, No. 627) we gave an exterior perspective view of Honolulu Cathedral; and we this week give a view of the choir of the same cathedral, the only portion of the work which the architects, Messrs. W. Slater and Mr. R. H. Carpenter, have as yet undertaken, the nave, transepts, and towers being deferred till a future period. The length of the choir from the first step to the outside of the apse columns, we may observe, is 45ft. It has been the object of the architects to convey the cathedral idea more by the general plan and arrangement of the building than by any grandeur of design or physical magnitude. The local deficiency of building materials made it specially necessary to study simplicity in its details, for there were only two courses open—either to send out the masons' work complete from England, or to build the whole of rough stone, plastered inside and out. A design embodying the latter idea was, as will be remembered, at first proposed, highly decorated with colour in the interior; but the other expedient was considered to be the best, and has been acted on. The choir has three bays, with a polygonal apse of five arches, the processional path being continued all round it, with coupled windows in each bay. The columns of the arcade are cylindrical, with carved capitals, and the arches have two orders of simple mouldings. Above them runs a string of ornamental terra cotta under the sills of the clerestory window. In each bay of the clerestory are two lancet lights with coupled shafts; the bays of the apse have one light. The bays are divided by shafts resting on corbels above the arcade caps. These shafts run up to the level of the springing of the clerestory windows, at which level spring also the arched ribs of the roof. The whole of the roof is of timber, and boarded and panelled between the trusses, and is intended to be decorated with colour. For the ordinary walling black basalt and reef-stone (cut from the reefs by the native prisoners) is used. The natives thoroughly understand and can execute this sort of walling satisfactorily; but skilled masons' labour is very expensive, as much as five or six dollars a day being asked. Oregon timber and American pine are used for the roofs, which are covered with tiles. The windows of the clerestory will be filled with coloured glass, but the aisle windows will have movable glazed sashes, and inside Venetian shutters. The stone used for the arcades and windows is Ketton, white Mansfield, and Doulting. There will be two rows of stalls, six in number, on each side, the dean and precentor's stalls being respectively at the west end of the north and south blocks, and the chancellor and treasurer's stalls at the eastern end. The bishop's throne will be on the south side eastward of the stalls. The altar is raised seven steps above the nave level, and will have over it a lofty baldachin of metal work. A low iron screen is to stand in the western arch; and there will also be iron grilles in all the side and apse arches, with gates opening into the processional path.

HAWKSLEY'S PATENT STEPS.

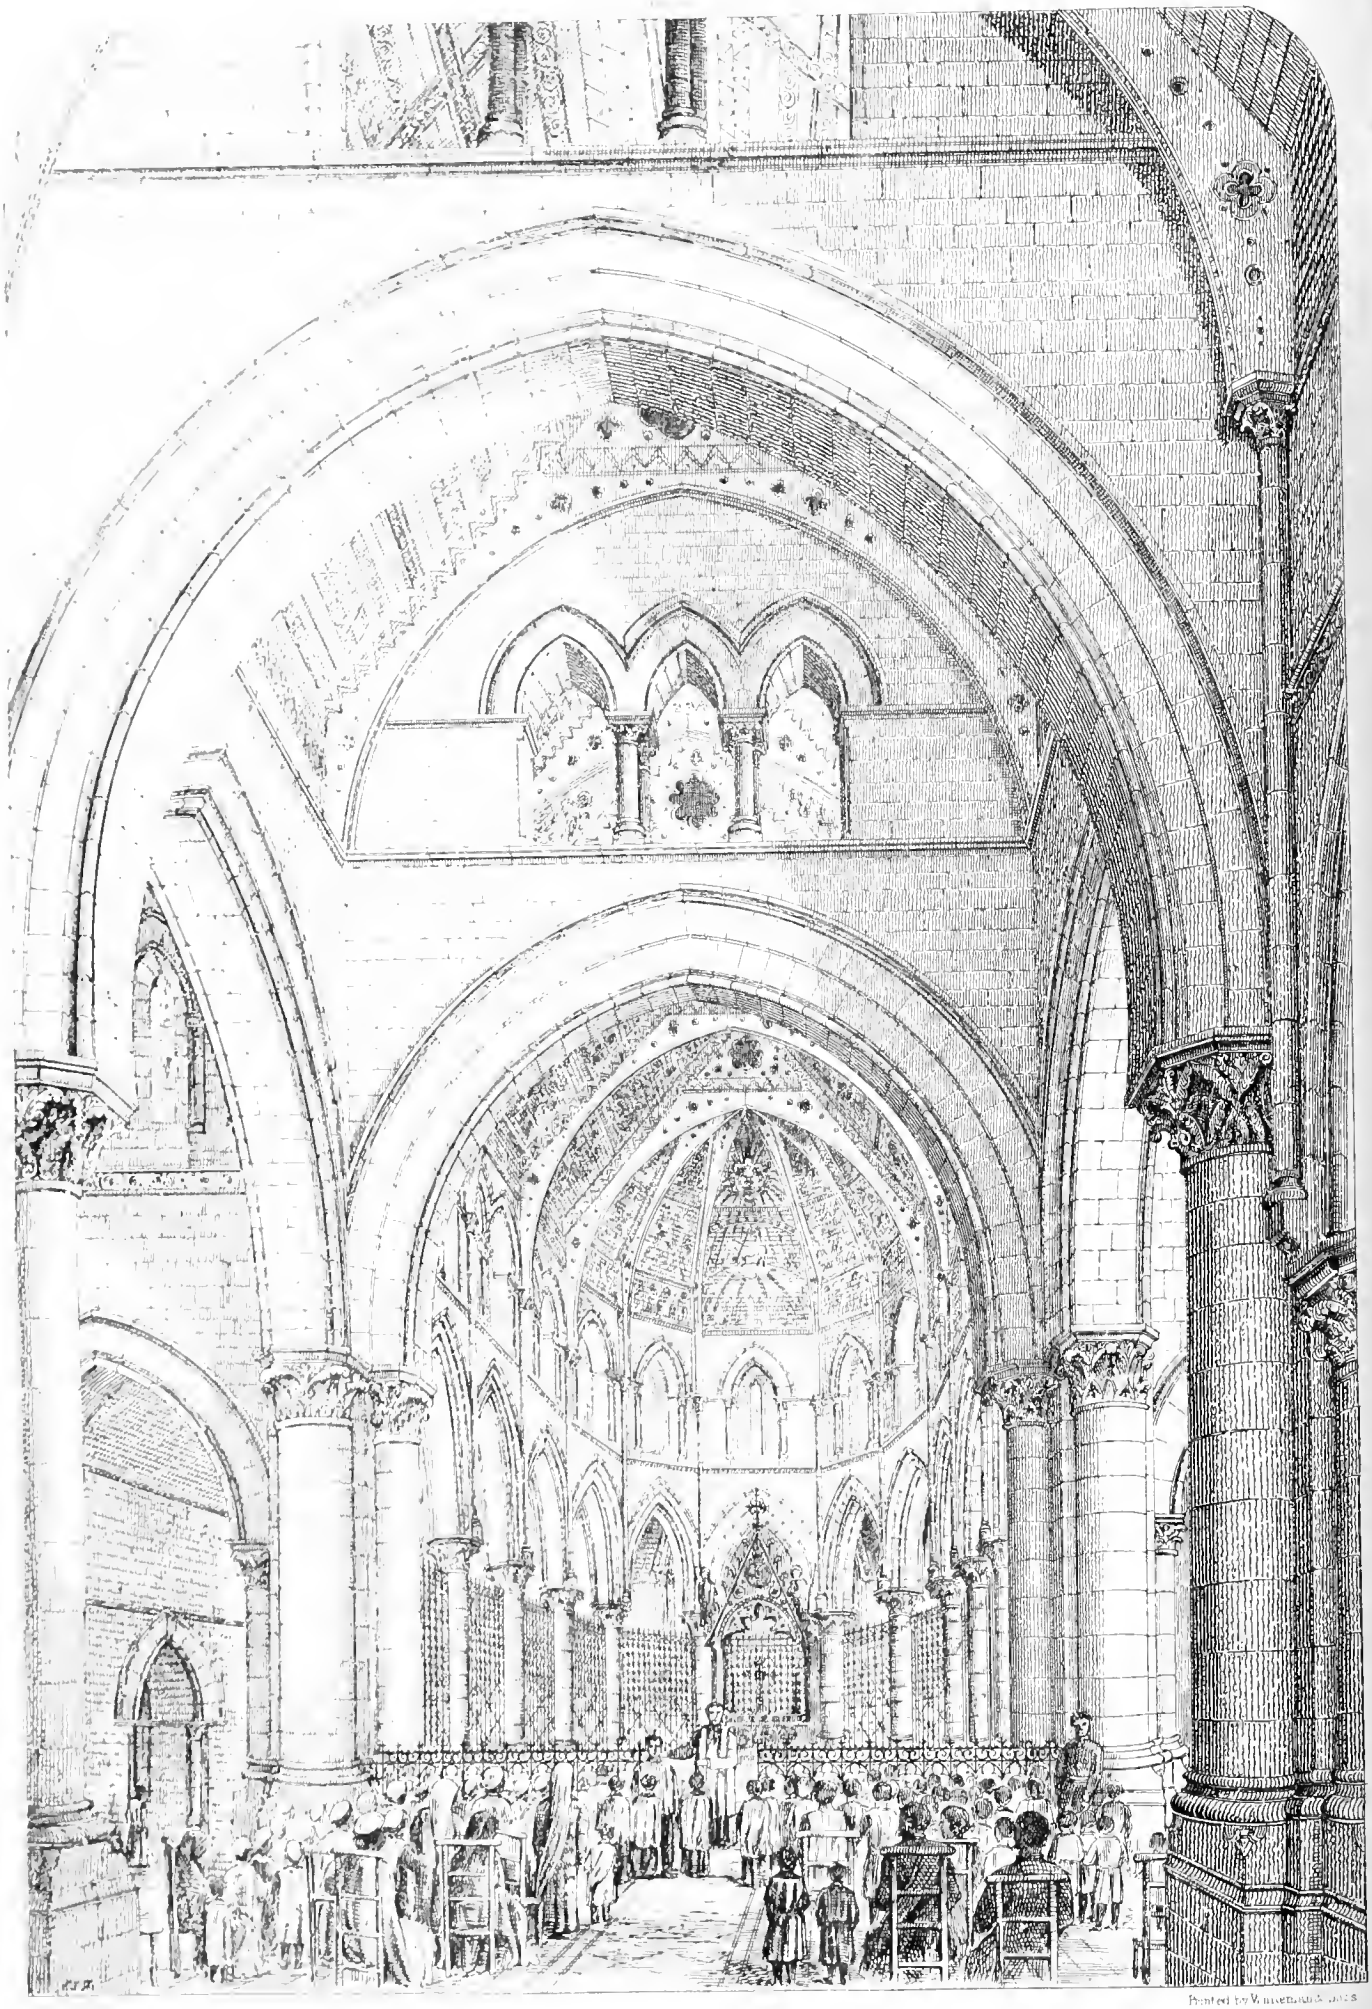
MANY of our readers have no doubt witnessed the rapid wear and tear that stairs and steps are subject to at railway stations and other places where there is an immense traffic. Hence, unprotected wood is but of very little use for such a purpose at such places. Sometimes lead and sometimes brass edging is put on the



nose of each step as a protection. Lead, however, soon wears out, and brass is expensive. To meet this difficulty Mr. George Hawksley has recently patented an invention which is likely to be of much use. The invention consists of a cast-iron frame, having numerous square openings, of the form of the tread of each stair or step. Into each opening is inserted, as seen in the illustration, square pieces of wood, with the grain upwards. Experience has proved that a step so constructed will admit of a vast amount of wear. We are informed that at the Victoria Park Railway Station, through which passes a greater traffic than at any other station in the metropolis, and where lead edging wears through in six or eight months, Hawksley's patent steps have been used for twenty months without perceptible wear. It is used in most of the North London stations, and we can personally testify as to its utility and durability.

SMOKED CEILINGS.

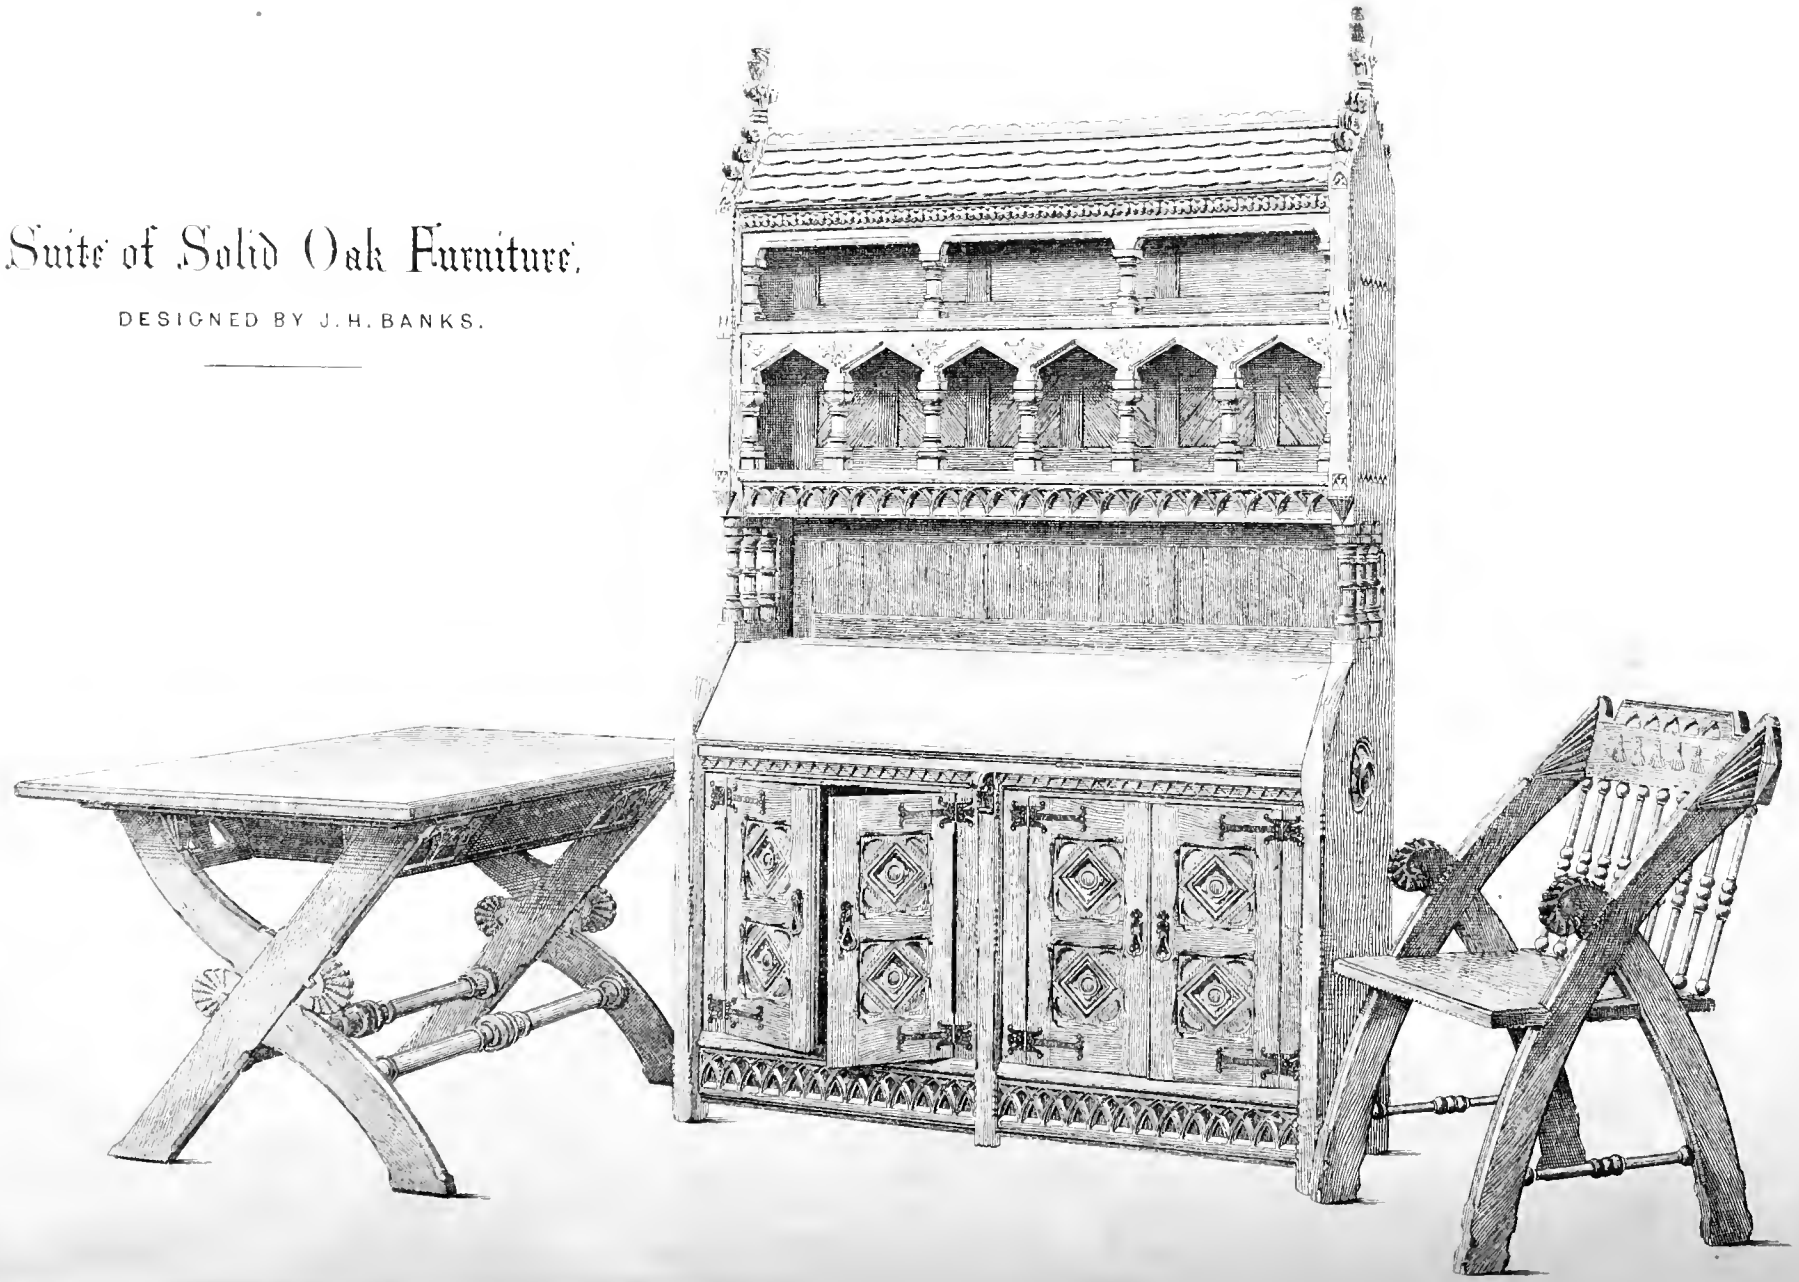
IT is generally supposed that the smoking of ceilings is occasioned by impurity in the gas, whereas, in this case, there is no connection between the deposition of soot and the quality of the gas. The evil arises either from the flame being raised so high that some of its forked points give out smoke, or more frequently from a careless mode of lighting. If, when lighting the lamps, the stop-cock be opened suddenly, and a burst of gas be permitted to escape before the match be applied to light it, then a strong puff follows the lighting of each burner, and a cloud of black smoke rises to the ceiling. This, in many houses and shops, is repeated daily, and the inevitable consequence is a blackened ceiling. Now, if the match be applied to the lip of the burner, and the stop-cock cautiously opened, no more gas escapes than is sufficient to make a ring of blue flame; the cock should then be gently turned on until the flames stand 2in. or 2½in. high. When this is done, few chimney glasses or globes will be broken, and the ceilings will not be blackened for years.



Choir of Honolulu Cathedral. W. SLATER & R. H. CARPENTER, ARCHTS

Suite of Solid Oak Furniture.

DESIGNED BY J. H. BANKS.



THEATRES.*

HASTE in building is an evil which overshadows all others connected with modern theatre construction. The bad arrangements of line and mass, the defects of the pit-extension system, the narrow vomitaries and the wretched exits are but slight inconveniences when compared with all that is involved in this word Haste. Let us see what it is which is involved by haste. It may be premised, as a matter of course, that no one ever builds a theatre for the love of the thing. Whatever force the dramatic art may have once possessed, it is quite clear that here, at any rate, it has no force in these days sufficient to encourage its most devoted patron to enshrine it in a temple worthy of it. The man or men who advance the money for building a theatre do it as a mere matter of money investment. On the other hand, affection for religion and affection for home have not yet altogether disappeared, and men may still be found sufficiently animated by the spirit of love to build church or house with some idea of safety and endurance, and with other wiser thoughts of investment than those which are founded on nothing but an excessive rate of interest. If the drama were all that some say it is, and that others hope it may become, if it were a real teacher and a real refiner, if, as in old time, it were a co-worker with religion, poetry, and philosophy, it would be treated as worthily, and housed in enduring temples as strongly and as nobly built, as cathedral or palace. Instead of this we find it accommodated in what the sad experience of the last few years too plainly proves to be nothing more than the flimsiest of temporary lodgings. But if, as some think, the drama in England is in a moribund condition, then the sooner it is carried out and buried the better. Its habitations might then be swept clear away, and the holocaust, which hangs like the sword of Damocles over every theatre in England, would be averted for ever. Although much —very much—in the present aspect of the stage tends to encourage this hopeless view, although men of a literary or artistic turn of mind rarely come away from the theatre without confessing their fatigue and disappointment, and although the greatest "successes" are for the most part the results of the most unhealthy excitement, still I cannot help thinking that the drama has a work to do, a position to occupy, of which we are as yet but partially conscious. When we have become alive to the importance of the art as a prime instrument in the field of education, when the pictures of the stage shall be as true within the bounds of true conventionalism and the dramatic ideal as nature and museum and book can make them, then we may expect to see theatres built for the honour of the art, instead of for the greatest percentage on the least possible outlay. Meanwhile this, like every other question of reform, must be treated as something to be developed. We are not ripe for sudden and sweeping changes, which only tend to bewilder the public. At the same time it is impossible to rest contented with the present state of things. The primary reason for haste in theatre building is to obtain a quick return for the outlay. For this everything is sacrificed. An architect is selected who shows the proprietor how eminently qualified he is for the work by consenting or offering to get the building ready for use in as many months as ought to be absorbed by the architect in *thinking* out the subject. The first consequence of this weak consenting on the part of the architect is to shelve all idea of "thinking," and merely to adapt from what has already been badly done by himself or his contemporaries. The greater haste the greater success, is the motto alike of proprietor, manager, and architect; and the second consequence of the architect's acceptance of the conditions is insecurity of structure, for as brick walls and vaults take time to build and time to dry, it is manifest that time will be saved wherever wood can be used in place of brick, plaster, or stone. That by the free use of wood framing and thin boarding the interior of a theatre is made as combustible as an ancient pyra, is of slight moment compared with the receipts of a season; and it is very clear that the architect's endeavour to enrich his client (and thus obtain a character for what is called "business-like qualities") should supersede all other considerations, and especially such trifles as the convenience of the public or the safety of the audience. Even in those cases where brickwork has been introduced in a larger degree than usual, haste steps in and compels the builder to carry up the walls with a speed altogether inconsistent with sound construction. Moreover, the mere fact of a brick wall being introduced here and there is worth little or nothing in a conservative or preventative sense unless a fair substance is secured—that is to say, the walls of a building which has always large quantities of combustible material stored in it must not be regulated by the minimum allowance of the Act of Parliament (an Act, by the way, which has done incalculable harm). Haste, again, is the parent of most of the mistakes in what is called the "decoration of the house." We have seen of late years an indication of something better than usual, in the employment of first-rate artists to paint figure subjects. The innovation has been but feebly carried out, and no artist can be said to have had a fair chance; the works have not been painted on the spot, and I believe no encouragement has been given to the painter to re-touch his work. No one, I imagine, can put this down to anything but haste. This it is which compels all the decorations to be executed on canvas during the time the house is actually building, so that experiment is out of the question, and there is no opportunity until too late of seeing the effect of distance or the form of the house on the colours or lines which have been applied on the canvas within the narrow limits of the painter's studio. This same impolitic haste, with all the evil hurry-scurry which invariably accompanies it, prevents also anything like joint action among artists; for, however artistic an architect may be, and however anxious to do well, it is simply physically impossible for him to hold that communion with his co-workers (painters, sculptors, decorators) which is so absolutely necessary to make a building successful; whilst to draw and design any decoration to a large scale with his own hands is equally impossible, even if he has the power to design ornament, a power which is by no means common in any branch of art. This question of rapid building is one of real and serious interest; and it would be well if the legislature could be urged to interfere in this vital question. Parliament has dictated all kinds of things for the encouragement of cheap and nasty building; it has made all sorts of little provisions for all sorts of trivial things; it has placed innumerable restraints upon sound construction; for the security of the outdoor public it has been tenderly anxious; for the passer-by, who has room to come and go, it has enacted no end of safety clauses; but it has done nothing for the indoor public, and has been altogether careless of those masses who are thickly crowded beneath the inflammable roofs and slight construction of our public places of amusement. If the new Parliament would deserve well in this department of domestic affairs, let it look well at the condition of our public buildings, and do something to mitigate the immoderate haste with which so many of them are framed.

EDWARD W. GODWIN.

* Continued from page 207.

THE TERMINUS OF THE MIDLAND RAILWAY, NEAR KING'S CROSS, LONDON.*

I VENTURE to call the attention of the members by a few words to what may be considered one of the most important works now carrying on in our metropolis, vast in extent—for it will cover seven acres—and gigantic in the proportions of its terminus shed. This grand feature is distinguished by a construction which, as to boldness and ingenuity, reflects the highest credit for conception and execution on its eminent engineer, Mr. W. H. Barlow; on Messrs. Waring, the contractors; on Messrs. Ordish and Le Feuvre, who designed the details of the roof; and on Mr. Alleyne, of the Butterfly Iron Works, who arranged the travelling staging and hoisting gear for the purpose of fixing the roofing in its place.

The roof of the terminus shed is 690ft. long, and has a clear span of 240ft. The main ribs, which are 29ft. 4in. apart from centre to centre, are latticed, and 6ft. deep, forming the curve of a four-centred pointed arch, the radii being 57ft. and 163ft. respectively, and rising to the height of 96ft. above the level of the platform. The feet of the ribs cover a remarkably small area, as though they stood on pins; but here at the springing, instead of being latticed, they have plate webs and are let into a shoe, which spreads out on each side to the projection of a buttress, so as to give a firm footing, and these shoes are bolted down to anchor plates at the foundation, built into the wall to ensure further stability. Except the shoes, the whole consists of plate iron, three intermediate ribs between the main ribs being of rolled iron, I section, 10½ inches deep. There are at regular distances on the sweep of the roof trussed purlins to carry the intermediate ribs, and so constructed that they stiffen laterally the lower flanges of the main ribs. In the whole height of the roof there are no ties, the sweep being so adjusted, and the weight so distributed and equipoised, that the series of girders, about 2ft. deep, extending across the station at the level of the floor, are sufficient to retain the feet and resist the tensile strain at that point upon the ribs.

The floor is also designed with considerable ingenuity, and merits our attention. The whole area, 690ft. by 240ft., is upheld by a series of cast columns, 14ft. 8in. apart from centre to centre, and 15ft. high, and on the caps are the transverse girders already mentioned, and a series of longitudinal girders. The vaulting, if it may be so called, of this basement storey or ceiling rests on this net-work of girders, and is formed of Mallet's buckled plates securely fixed to the girders, and thereon comes the floor. Thus it will be perceived that the columns afford clearer space for stowage beneath than piers would have done, and the buckled plates are lighter and more sure in construction than brick vaults.

The ribs and roofing are erected and fixed in place by means of a travelling staging and hoisting gear. The system on which Mr. J. G. N. Alleyne, of the Butterfly Iron Works, has designed the staging is, that the main rib is never lost hold of until all the wind-ties are finally fixed to the walls. The staging is divided into three sections, the centre consisting of six divisions, the side ones of five divisions each, and from front to rear there are four divisions. The standards consist of die-square balks of timber, 12in. square; the horizontal traverse pieces are double, 12in. by 6in. each, except the lower one, which is 12in. square, with iron shoes bolted down to receive the feet of the standards and braces. The cross braces are 12in. by 12in. in the two lower tiers, 10in. by 10in. in the two next tiers, and in the upper ranges 9in. by 9in. The wheels, on which the three sections move are 2ft. 8in. in diameter, and run on a balk of timber, 18in. square; altogether, there are 123 wheels under the staging. Of course, the three divisions of the staging can be moved, and are moved distinctly and separately; but when main ribs are being hoisted and adjusted, they are all three bolted together at each horizontal timber with wrought-iron clamps and bolts, and screwed firmly together against a chock of timber. Each gallery of the stage is fitted with two slides, which are forced outwards against the rib by folding wedges, so that the work can be adjusted to the greatest accuracy.

* Read by PROFESSOR DONALDSON before the Royal Institute of British Architects, March 16, 1868.

For moving the staging the following process is followed. When, in the first instance, two ribs have been fixed and the riveting finished, and everything is properly adjusted, the folding wedges of the two side stages are knocked out. The rib, in taking its proper deflection, rests firmly on the centre compartment; the wedges of this are not disturbed, the whole centre compartment being kept bolted down to the floor. The slides are drawn inwards, and the side divisions of the staging are moved, so that the slides originally opposite to No. 1 rib are brought to be opposite No. 2 rib; they are then wedged out and bold No. 2, and are in turn bolted down to the floor. The wedges of the centre compartment are now removed; it is set free from the floor, moved up to No. 2 rib, and the three compartments or divisions are bolted together as before, and are then ready for No. 3 rib. The sides may be moved in about thirty minutes each, and the centre in ten minutes. These movements may be effected by hand-power of three men with iron bars to each wheel. For hoisting steam power is used. The derrick employed for the purpose is arranged with an universal joint, so that it can be raised, lowered, or twisted round in any direction. The steam crab is furnished with a double warping barrel, so that the rope does not accumulate on it—a system first used, probably, at the Exhibition in London, 1862.

THE NEW UNIVERSITY OF LONDON.

THE Senate of the University of London, at its last meeting, finally decided upon the figures which they believe are most suitable for the ornamentation of the exterior of the new building in course of erection in Burlington Gardens for the purposes of the university, and which is at last making fair progress.

1. It has been thought that the four figures over the four piers of the entrance portico should typify the four faculties of the university as represented by Englishmen illustrious in arts, science, law, and medicine; and those of Bentham, Milton, Newton, and Harvey were happily chosen. The Chief Commissioner of Works at first demurred, we believe, to the position assigned to Bentham, but this must have been in ignorance of the intention and meaning of the Senate. Bentham they believe to be the best representative of jurisprudence and the science of legislation as distinguished from law in the common sense of the term; and a knowledge of his works has always been more or less demanded from candidates seeking the degrees in law. The Chief Commissioner further suggested that Shakspeare should appear amongst the distinguished representatives of modern knowledge, and find a place over the portico. It was at once rejoined that Shakspeare could in no sense be regarded as an example of academic culture, and his statue will, therefore, not displace that of Bentham, but be placed in a prominent position within the building itself.

2. Along the roof-line of the central portion of the building six standing figures in the classical style will represent men of ancient times eminent in various departments of study included in the university course, and Cicero, Galen, Aristotle, Plato, Archimedes, and Tribonian have been selected for this group.

3. In the niches of the ground floor of the wings will be placed six portrait statues of distinguished representatives of modern knowledge; those on the west wing being British, on the east wing foreigners. In the former position will be found Locke, Bacon, Adam Smith; in the latter, Cuvier, Leibnitz, and Linnæus.

4. There will lastly be on the roof-line of the wings six standing figures of representatives of modern knowledge—those on the west British, those on the east foreigners, and these will be supplied by Hume, Hunter, Dalton, Galileo, Laplace, and Goethe. In addition, the statues at the angles of the wings will be grouped with astronomical and chemical accessories, sufficient to give the required mass, instead of being double groups as proposed by Mr. Pennethorne.

Opinions differ as to the probable beauty of the building when erected. Not a few persons regret that the wings are not to be carried up to a level with the central part of the building, and anticipate that it will not be sufficiently imposing for a university. However, whatever may happen outside, it is certain that the doings within its walls will still further increase the brilliant reputation which the young university has already made for itself.

RANSOME'S ARTIFICIAL STONE.

THE highest endorsement of the qualities and capabilities of this remarkable product, says the *Mechanics' Magazine*, is probably its intended introduction, by Mr. Digby Wyatt, in conspicuous positions in the new Government Offices, in Downing-street. It is to be used for a pair of enriched truncated pierced screens, in the Renaissance style, which are to enclose the third-floor galleries of the Indian court. This fine quadrangle was designed to have been left open at the top, but is being covered by an elegant roof of wrought iron, which will be filled in with glass throughout. The inner faces of the quadrangle consist of windows almost entirely, excepting only the spaces taken up by the polished granite columns, and the piers which support the superstructure and spaces at the ends of the quadrangle for eight statues of distinguished Indian governors and heroes, and appropriate historical tableaux in alto-relievo. Three galleries cross each end of the court on a level with the respective floors, the two under galleries having balustrades in front. The upper galleries will have the screens referred to, in addition to the balustrade. They have been designed, with exquisite effect, by Mr. Digby Wyatt, and are each 67ft. long by about 6ft. 8in. high, with a mean thickness of about 6in., and will contain about 340 cubic feet. Had the patent stone been liable to warp or shrink it would, of course, have been totally unsuited for ornamental work of such a high character. But it has been abundantly demonstrated to possess incapability of shrinkage, and the absolute rigid retention in every particular of the form in which it leaves the mould. A convincing test as to shrinkage has repeatedly been applied with success, viz., by casting in a block a piece of plate glass cut to parallel lines to preclude the possibility of dovetailing. On breaking the stone after it is thoroughly hardened it is found impossible to extract the glass by any other process than cutting round it to the bottom, which would not be necessary if even the slightest degree of shrinkage took place.

The patterns—to Mr. Wyatt's drawings—and the moulds from them, have been made by the art workmen at the company's works, East Greenwich, and the screens, which are in a forward state, will be finished and fitted as soon as the roof of the quadrangle is covered in, although that need not hinder their erection, the material being invulnerable to atmospheric influences. Builders and contractors are now getting bound doors, sashes, mouldings, and other carpentry goods from Norway and Sweden; they will never need to go so far afield for capitals, finials, trusses, balustrades, or other ornamental work in stone, while the Patent Concrete Stone Company is able, as now, to compete against all comers.

STREET WATERING.

A CORRESPONDENT says:—Sir,—In looking over *The Engineer* for 1859 I accidentally alighted on the following paragraph, and thinking it may very possibly resemble Mr. Cooper's new patent system, which is making so much stir just now, it is worth re-publishing:—

September 2, 1859.

"*New Process for Watering Streets.*—A curious experiment is now being tried at Lyons for laying the dust in public promenades, and has so far been attended with success. A chemist of that city, having accidentally spilt some hydrochloric acid on a terrace of his, found that it hardened the spot on which it had fallen, and maintained it in a state of permanent moisture. This led him to think that, by watering the streets with this acid, the dust on large macadamized roads might be laid or rather prevented from rising. Experiments were first made on the Cours Napoléon, between the Rhône and the Perrachio Station. The success was complete, and has also proved durable, the carriage way having now been several months free from dust; and another experiment is now being made on the Place Bellecour. During the hottest part of the day, the ground, although dry and gravelly, has the appearance of being as consistent and damp as if it had been watered half an hour before; but as evening approaches, the moisture becomes more and more perceptible. Every morning the ground is stiffer and more comfortable to walk on. This may be easily accounted for: the acid decomposing the gravel or stone, forms one or several deliquescent salts, which therefore attract the moisture of the air. The question as to whether roads thus watered are likely to last as long as they ought, can only be decided by time."

Perhaps you, or one of your correspondents, might be able to tell me whether the system referred to is still continued, or whether it was abandoned as a failure.

SCHOOL OF ARTS IN PARIS.

THE Minister of Agriculture, Commerce, and Public Works has just issued the programme of the conditions of admission to this important school, which is open to foreigners as well as natives of France, and on the same conditions. Diplomas of "Engineer of Arts and Manufactures" are granted annually by the Minister to those pupils who are recommended by the Council of the school as having passed through all the examinations in a satisfactory manner, and certificates of capacity are granted to those who have exhibited sufficient knowledge in the most important departments of instruction. All the pupils are out-of-door scholars, and no uniform, nor any other distinctive mark, is worn by them. The course of study occupies three years, and the fees, including the costs of experiment, are 800 francs (£32) per annum, half the amount being paid on entering, and the remainder, in two equal instalments, in the months of February and May. The only other conditions are—the deposit of a sum of 35f. to defray any losses or injuries done by the pupils' negligence, and the purchase of the necessary books and instruments, which may be had at the school, at rates fixed by the director. In the case of pupils, natives of France, whose families are not in a condition to defray the costs of the school, subventions are granted by the State, under certain conditions, but this, of course, does not apply to foreigners.

All pupils, says the *Society of Arts Journal*, must pass an examination before admission, and these examinations take place twice in the year, namely, in July and October. The programme for admission consists of compositions and oral examination in the following subjects:—French language; arithmetic; elementary geometry; algebra, as far as the general theory of equations exclusively; rectilinear trigonometry; analytical geometry; descriptive geometry; physics; that part of the usual course of the lycées which precedes heat; chemistry; rudiments of metallurgy; natural history; freehand, linear drawing, and tinting. In addition to these, the pupil is examined also in the general subjects, as in other superior schools. Full particulars are to be obtained by application to the secretary of the school. The pupils must have attained the age of seventeen on the first day of the year of application, and must produce testimonials of good conduct and a certificate of vaccination.

WINDOW PANES IN WINTER.

OUR contemporary, *Galignani*, records a very curious discovery recently made by M. Auguste Bertsch, and which has been turned to practical account by M. Kuhlmann, the celebrated chemist. Who is there that has not, during cold winters, stopped to admire the beautifully symmetrical and yet fantastic figures of leaves and flowers depicted on the window panes of a well heated room, the air of which is charged with aqueous particles? M. Bertsch has found that Epsom salts (sulphate of magnesia) dissolved in beer, together with a small quantity of dextrine (artificial gum), and in this state applied to a pane of glass with a sponge or brush, will, on crystallising, produce the identical designs above alluded to, hitherto considered peculiar to water; with this improvement, however, that the liquid may receive any colour whatever, at the option of the operator. The ephemeral productions of frost may thus be easily perpetuated; but M. Kuhlmann, on being apprised of the fact, conceived the idea of going a step further, and transferring those fairy-like creations to stuffs and paper. For this purpose he first got the crystallisations on sheets of iron, on which he afterwards laid one of lead. By means of a powerful hydraulic press the minutest details of the figures in question were durably imprinted on the soft metal, and a copy of them in relief was then obtained by galvanoplastics. But here another difficulty arose. In the impression of cotton stuffs the pattern must be continuous; whereas in M. Kuhlmann's plates the lines at one end would clearly not coincide with those at the other, so that disagree-

able interruptions would be caused in the printed designs. This obstacle, however, has been overcome in a most ingenious manner by effecting the crystallisation on the cylindrical surface of a roller. A slight rotary motion imparted to it will prevent the liquid from accumulating at any particular point before it has evaporated.

COMPETITION.

ST. ANDREW'S CHURCH, HERTFORD.—The committee met in the Shire Hall, Hertford, on March 27, to select a design for the rebuilding of St. Andrew's Church. Five designs were first voted for, viz:—"Well considered," 8; "A device" (a quartrefoil), 7; "All things considered," 7; "Hope and Faith," 1; "£3,000," 6 votes. The competition was at length between "Well considered," 8, and "Quartrefoil," 7. The former was unanimously chosen as being the most worthy to carry out the above object. The architect is Mr. John Johnson, 35, Moorgate-street, E.C., whose estimate is £3,000, exclusive of tower, carving, lighting, or warming. In our observations on the drawings (March 13), we spoke highly of the selected design "Well considered," and also mentioned that the choice was between several of the above-named mottoes. The decision is considered quite impartial.

SCHOOL OF ART.

THE other day deputations waited upon the Duke of Marlborough, as President of the Privy Council, to present memorials praying for a Government grant in aid of the Midland Institute and the Birmiogham School of Art. Mr. Mathews, on behalf of the Birmingham and Midland Institute, referred to the position which they held in the educational work of the town. The Institute cost £23,000, all of which was subscribed in the neighbourhood. Their students were taught at a loss of about £400 a year. It was impossible to make the classes self-supporting, as the cost of teaching would be above the reach of those taught. The prizes, too, which were given, were very insignificant, and ought to be increased in value. At present the students could only earn from the grant £30, which was insufficient. Mr. C. R. Cope, on behalf of the Birmingham School of Art, pressed for assistance, to enable them to erect suitable rooms for imparting instruction. They had about 1,050 pupils now, and were obliged to turn applicants away. At present the school had a suite of rooms at the Midland Institute, which were now wanted for the science scholars. The claims of both institutions having been urged by several other gentlemen present, the Duke of Marlborough promised that Government would give its early attention to the matter.

Building Intelligence.

CHURCHES AND CHAPELS.

A new Methodist Chapel has been completed at Wolstanton, Staffordshire. The building, which is of a plain character, cost £850, and will seat 350 persons. The architect employed was Mr. R. Dain, of Burslem; and the builder, Mr. J. Trevor, of Newcastle-under-Lyne.

The parish church of North Reston has been fully restored, under the direction of Mr. Withers, architect, London. The work was executed by Mr. C. Clarke, of Louth.

A new church is about to be erected in the parish of St. Marylebone, in the immediate neighbourhood of Dorset-square, for a new district, which will bear the name St. Cyprian.

The quarterly meeting of the Salisbury Diocesan Church Building Society was held last week under the presidency of the Lord Bishop. Applications for aid were received from the promoters of works of restoration at Trowbridge, Holy Trinity, Dorchester, and Drimpton, and grants were made in each instance. The usual routine business was transacted, and an earnest appeal for further subscriptions made, it being announced that the grants made at this meeting would nearly exhaust all the Society's available funds for the present year.

BUILDINGS.

The market at Bury having undergone important alterations, under the superintendence of Mr. Green, civil engineer and architect, of Portsmouth, near Todmorden, has just been reopened. The cost of the work has been between £4,000 and £5,000.

The extensive buildings in course of erection by the Middlesborough Exchange Company are rapidly approaching completion. The various offices, nearly sixty in number, will be ready for occupation in May, and the large Exchange Hall is expected to be finished by July, when the whole will be opened with an appropriate demonstration.

The committee appointed by the town to carry out the Redcar Sea Wall and Promenade improvements have contracted with Messrs. Lynas and Middleton for the labour required in the construction of the work for the sum of £1,056, the committee finding materials. The estimated cost of the whole, which forms a substantial roadway and wall of paved slag facing the sea, is £2,400, towards which upwards of £1,900 is already subscribed, of which £1,000 is the contribution of the Earl of Zetland. The work was commenced last week.

The new courts and offices for the Borough of Wigan are nearly completed. The building is in the Italian style, the main façades being faced with Longridge stone up to the first-floor windows, the second storey consisting of pressed red bricks with stone dressings. Messrs. Nuttall and Cook were the architects, their design being chosen from fourteen sets sent in competition. Messrs. Fairclough and Son, of Wigan, are the contractors. The cost of the building is about £17,000.

It is once more positively stated that Her Majesty's Theatre is to be rebuilt. The Prince of Wales, if rumour be true, will lay the foundation stone on his return from Ireland. Mr. Charles Lee is to be the architect, and the cost is put down at £65,000—certainly a very moderate sum. The Bijou Theatre—the theatre within a theatre—will not be rebuilt.

During his recent visit to Australia, H.R.H. the Duke of Edinburgh laid the foundation stone of a fine graving dock, which is in course of construction at Williamstown, Victoria. This dock, which has been named the Alfred Graving Dock, will be 420ft. in length over all, and 400ft. long on the floor within the entrance. It will be 97ft. in width at the top, and the entrance will be 80ft. wide in the clear. At ordinary spring tides there will be a depth of 24ft. 6in. over the sill at low water, and 27ft. at high water. The dock is being built of the basaltic stone of the neighbourhood, known as bluestone, and its cost, complete, with pumping engines, &c., is estimated at £185,000. The dockyard, with which the graving dock will be connected, comprises an area of fifteen acres, and includes a slip capable of raising vessels of 2,000 tons. The new dock was commenced in 1864, and it is expected that it will be completed in 1869.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—O. W. D.—M. and Co., with photographs and samples of paper.—A. H. H.—M. H. and Co.—A. B.—E. C.—I. L.—T. M. S.—C. F. H.—G. S.—A. C.—I. D. W.—I. R., with drawings.—I. H. P.—F. B. and Co.—I. I and Sons.—W. F.—D. O. B.—C. R.—R. S.—G. D. I.—I. L. H. G.—L. and Son.—I. F. and Son.—R. L.—W. H.—I. I. —H. D.—B. J. T.—M. and Co.—I. I. B.

R. W. M.—Your question on brass rubbings was answered in the BUILDING NEWS, No. 657, page 554.

SUBSCRIBER, who deals pretty largely in personalities, takes good care to be safe himself by not even sending his name.

S. L. W. wishes to know whether any decision has been come to on the competition for the church of St. Swithin, Lincoln.

Correspondence.

ORGANS.

To the Editor of the BUILDING NEWS.

SIR,—I will not follow your correspondent "W. T." into the question of Covent Garden scores or the meteorological influences upon the singers, the public, and the orchestra; though, if he is consistent in his ideas of orchestras as compared with organs, I suppose that he would return to the orchestras as they existed in the time of Handel and Purcel, and that he votes Mozart and his successors bores. Nor will I do more than note the audacity of the assertion that "there is only a certain variety of tone possible." Anyone who will assert that all the possible variety of sound is produced by the finest German organ, or by any old organ in existence, merely makes a rash statement utterly incapable of proof.

In the first letter upon this subject that occurred in your columns, "A. B. C." remarked that mechanical power alone would not secure a fine instrument; but that an organ builder, to be a good one, must be an educated man. Now these positions I am certainly not going to controvert. I presume, however, that by education was meant musical education, as, in fact, at the end of the letter it is so limited, and a hard slap is given to the parsons (almost always men of good usual education), who, with their half musical education and various crotchets, will meddle with things they don't understand.

Taking my stand here, then, I would remark that it is rather a curious fact that neither of the trio named as *the* organ builders of the world are educated musicians. I am informed upon authority that I cannot doubt that not one of them is an organ player. Granting, then, that fine mechanism is not the only requisite for producing a fine organ, I still maintain that a great knowledge of mechanism is necessary for its production, and when accompanied with great musical ability, and accurate and intimate acquaintance with music and musical instruments—qualities, I confess, seldom to be found in the organ-building fraternity—I say, that then it can hardly fail to lead to great results. Now, these are the very qualifications of the organ builder whom I singled out as the most advanced example of the advancing school. If Mr. Willis had not been a great organ builder, and so had his time so fully occupied, he would have been a great organ player.

The whole of the question of the production of sound, its variety and proportion, is so open to discussion that it would be impossible to carry it on in a periodical correspondence. This much is certain, that the "leave things as they were" principle is no wiser or more possible in music than in politics. The sound must be proportionate and apportioned to the place in which, and the uses for which, the organ is required. Those who love to listen to the soothing, sleepy tones of their own extempore performances are pretty sure to prefer the old style.

I am asked, if good metal is not necessary, why the great organ at Hyde Park is to have tin pipes? It was said that the advocate of Willis was an advocate of cheap metal. I mentioned this and other instances to show that where there was no lack of funds he preferred good metal. The reason for using pure tin in the present case is simply and solely for the appearance. The tone will be precisely the same, granting the same conditions of scale, wind, voicing, &c., whether produced by tin, spotted, or white metal. This is not a matter of question; it can be tested and has been tested over and over again.

Now for my other opponent. I beg to inform "Y. Z." that one-third of tin produces but a poor spot, hardly worth the name, and that two-thirds, his other limit, does not spot at all; it is here that the metal becomes bright—at two-fifths the spots become confluent, not so pleasant to the sight as one-half, but superior in all other respects. The fact is unfortunately that metal with one-half or less tin has an unhappy quality of getting soft by age, so that it is positively better, unless metal of a fine quality can be afforded, to use an alloy of lead, tin, and antimony than the ordinary and nicest looking spotted metal, especially as the best builders have now ceased to thrash the pipes with tuning cones.

In writing now I feel that I am before the organ-building craft, and I am sure that our old notions about organs improving by age are erroneous. Their alteration, and, as I think, loss of fulness of tone, arises, in my opinion, from the instability of the metal; for in every old organ that I have seen there can be no doubt that the settlement at the mouth and foot has diminished the apparatus for the wind. If this is so, most likely the sounds we are told to deside-

rate were not those which the ancients themselves wished to get.

With regard to the metal in the St. Paul's organ, I have ascertained that they do not reach a spot. They contain, in fact, less than I said—viz., about 20 per cent. of tin, and so "Y. Z.'s" information upon this point is not more accurate than the myth about the Dean and Chapter locking the pipes up in the cupboard for fear of their being hurt. Of the organ at South Shields I have only heard, and so I will not offer an opinion. It is said to be a German organ, something like Schulze's work, certainly not so good as his. I have already said that I consider Willis in every way superior to Schulze.

I see no reason why I should name unsuccessful works of Mr. Lewes. I have no wish whatever to disparage him or do him damage; all I object to is the dictatorial attempt to thrust him down our throats, and to give him a position in the craft which he certainly has no claim to.

Thus, we are told that the organ at Shields "for beauty and power of tone far surpasses any instrument of a similar size constructed by Mr. Willis!" This is a mere assertion, and depends for the little value it may have as "Y. Z.'s" opinion upon whether he has really critically examined all or any of Mr. Willis's organs of a similar size. I cannot help doubting his extensive knowledge with the multitude of organs built by Mr. Willis, because of his remarks upon his Liverpool instrument, with which it is pretty certain he is not acquainted, or he could surely never have said anything so foolish as that it did not fill St. George's Hall. I can from personal knowledge affirm that there never was a more unfounded assertion. In judging of that splendid work we must remember that it was built sixteen or seventeen years ago, and that the most astonishing improvements and inventions, especially in the matter of reeds, have been made since the time of its building. But, before the addition of the great reeds, Mr. Hopkins and Dr. Rimbault, in the work on organ-building, call this an unrivalled instrument. The idea of its not filling the place is simply ridiculous. Ever since its erection, Mr. Willis has been making, and, in fact, is still making, so many improvements that in an instrument such as the Liverpool, which Mr. Willis, as well as all connected with it, would wish to be as perfect as possible, alterations from time to time are certain to take place.

Your correspondent's assertion with respect to *all* Willis's organs reminds me of an incident which happened to me some time ago. A clever amateur extempore player was inveighing in the usual style against the present degradation of the organ, and monsters in general, when some one asked what he thought of the Liverpool organ. "Ah!" he replied, "Abominable—a great, big, coarse thing like that at the Crystal Palace." But, when I quietly asked him if he had ever heard the said instrument, not having the presence of mind or moral opinions of Lord Chesterfield, he replied, no he had not. Can the assertion of "Y. Z." as to "all Mr. Willis's organs of such a size," and as to the unfilling qualities of the Liverpool one (Dr. Rimbault and Mr. Hopkins notwithstanding), be of a very different character to that of my musical friend?—I am, &c., J. C. J.

"NO MORE CHIMNEY TOPS."

Sir,—Your correspondent, who refers to the house which is being erected at Eastbourne, from my designs, without chimneys as ordinarily treated, has evidently not quite understood the whole scheme. The leading idea and the primary one being a flat promenade roof to the house, "chimney pots" in close proximity would, I think he will acknowledge, be objectionable. Your correspondent overlooks the fact that the smoke tower serves to ventilate every room passage, closet, and corner of the house by its superior extracting power. Then, why have "chimney pots?" Does not your correspondent believe in Mechi's "magic touch," which has been lately going the newspaper round? As to priority of invention, I am well aware that it is now too late in the day for anyone to do anything really original respecting chimneys. All I claim is an architectonic result, based upon sound engineering principles. I can refer your correspondent to plenty of single shafts that take several flues into them; but, if he be an architect, he will, I hope, spare me and your readers the pain of dwelling upon such things longer. In a few weeks I shall be able to give my professional brethren the result of my experiment—*i.e.*, as soon as we attach the flues to the smoke tower.—I am, &c., H. H. Vale, F.R.I.B.A.

17, South Castle-street, Liverpool, April 6.

PUGIN *v.* BARRY.

Sir,—Mr. Burton, in a letter last week on the "Throne drawing," quotes a passage from a friendly letter of mine, which might, I fear, accidentally lead to a wrong impression on the minds of your readers, viz., that I had made two criticisms on the same drawing, at variance with each other, to different friends. This apparent inconsistency will be at once explained by your kindly allowing me to state that the expression quoted regarding the touch being so like Mr. Pugin's was made on seeing the reduced photograph from the drawing, and not made as a criticism on the original drawing itself, which I had not seen. As I have no desire to inflict on the public weekly explanations of expressions in my private letters, I shall take it as a kindness if Mr. Burton, in any future correspondence on the subject, will avoid reference to them.—I am, &c.,

John Yardman Powell.

Birmingham, April 7.

Sir,—In a letter signed T. S. Burton, published in your last week's edition, I find that Dr. Barry is called on "for an explanation of the fact of Sir C. Barry's visit to Mr. Pugin at Salisbury from November 2, to November 9, 1835." A similar statement has been made by Mr. E. Pugin, viz., that Sir C. Barry was at Salisbury on that very week unknown to me, and he, Mr. E. Pugin, has put forth extracts from a so called diary of his father to prove it, thus: "Nov. 2, Mr. Barry arrived; Nov. 3, on River front compartments; Nov 9, Mr. Barry left." Now this I affirm is positively untrue. I left town on Sunday, November 1, 1835, for Mr. Pugin's, at Salisbury, and I was engaged with him until the 8th, finishing Mr. Graham's set of drawings for the Parliament houses. We worked together in the chapel of his house for the whole week, I resided at the house, and I know for a certainty that "Mr. Barry" was not at Salisbury during that time, and that Pugin was not engaged on anything for Mr. Barry.—I am, &c.,

Talbot Bury.

50, Welbeck-street, Cavendish-square, April 8.

[We cannot insert any more letters on this controversy.—Ed. B. N.]

Intercommunication.

QUESTIONS.

[810.]—MIXED CEMENT.—Will you, or some of your correspondents, kindly inform me what effect would be produced by using Portland and Roman cement mixed, say half and half; whether so used would be more durable for external cornice work, or separately; and if separately, which is best?—S. W. M

[811.]—MULBERRY WOOD.—Can you tell me where mulberry wood is to be obtained, as I want some to match in an old piece of furniture?—Cabinet Maker.

[812.]—FLAT SOFFIT FLUSHING.—How ought the circular groin line of a flat soffit, finishing upon a splay, be worked in brickwork?—R. X.

[813.]—BULGING WALL.—I have been building a flint wall, 1ft. 6in. thick, and 20ft. long, with good foundation, and 12ft. high, and it shows signs of bulging in the centre; what had I better do to make a sound job of it?—Nip.

[814.]—TO DEADEN RINGING OF AN ANVIL.—Could anyone inform me what will deaden the ringing of an anvil, so as to have the same effect as striking on lead?—A Constant Reader.

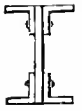
[815.]—TO DEADEN SOUND.—I should feel obliged to any of your readers who could inform me of the best way of preventing sound passing from one room to another. The rooms in question are separated by two 4½in. brick walls with a 3in. cavity between. At present the slightest noise in one room is distinctly audible in the other.—Metropolitan.

[816.]—STAMPED SPECIFICATIONS.—Some little time ago I asked whether it is necessary to have specifications. I received the answer that it is not usual to stamp them, unless they are to be enforced at law. I must confess that this answer does not satisfy me. Let us suppose a specification, with carefully worded general conditions, to be signed but not stamped, and a dispute to arise, can the conditions, &c., be enforced at law? I should be much obliged if some one would kindly give me a clear answer, for I fear that my ignorance of this point may lead me into difficulties.—Quiero Saber.

REPLIES.

[758.]—EGG SHAPED SEWERS.—Will you let me say a word about this question in "Intercommunication" in answer to your correspondent? There must be some mistake either in the original or copy, as it is impossible to work out the formula as given. It is $3 \log A + \log n + 6 s = \log D$; the diameter of the sewer in inches being represented by D. Every mathematician is aware that numbers, and the logarithms of numbers, cannot be manipulated together—they cannot exist in the state represented in the formula. For instance, we can have the expression $24 \times 34 = 816$, or its equivalent $\log 24 + \log 34 = \log 816$. The latter worked out would be $1.38021 + 1.53148 = 2.91169$. This last quantity being the log. of the number 816. We could not, however, work out the expression log. 24 + 34, which is similar to that given.—Algebra.

[774.]—STRENGTH OF WROUGHT-IRON GIRDERS.—In answer to the first part of "J. Walker's" question, the breaking weight at the centre of any girder may be calculated by the well-known formula $\frac{W = A \times d \times c}{l}$.



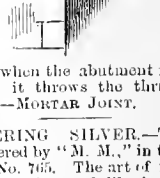
In this equation W is the weight applied at the middle of the span, A is the sectional area of the bottom flange in square inches, d is the depth, and l the length in feet; or both may be put in inches if more convenient. c is a constant, which varies according to the description of girder used. Its value for a girder, as shown in the sketch, may be taken at 75. As an example, suppose the angle irons to be 3in. × 3in. × ½in., with one rivet ¾in. in diameter uniting them to the web or vertical plate; then the value of A becomes equal to $2\left\{(3\text{in.} + 2\tfrac{1}{4}\text{in.}) 0.5\,\tfrac{1}{2}\right\}$ or 5½ square inches. If we suppose the depth to be one foot, and the span ten feet, we have the breaking weight at the centre $= W = \frac{5.25 \times 1 \times 75}{10} = 39.375$ tons. The girder would bear twice this weight uniformly spread or distributed over its surface. To obtain the sectional area necessary for the girder given by "J. Walker," in which the span is forty feet, and the distributed load ten tons, we must assume some depth, which may be taken at one-tenth of the span, or four feet. The expression for the strain at the centre is $S = \frac{W \times l}{8d}$, and in this case is $S = \frac{10 \times 40}{8 \times 4}$ = 12.5 tons. Supposing that we put a strain of four tons per square inch upon the material, we shall require $\frac{12.5}{4}$ or 3.125 square inches of sectional area in the flanges at the centre. This amount may be decreased towards the ends of the girder, where the strain becomes less. L. P. D.

[777.]—ARCHED PRINCIPAL RAFTERS.—The introduction of the laminated timber principle is due to De Lome, who constructed some fine examples of roofs of that description on the continent. The principle is simple, consisting merely in bolting together several thicknesses of inch or inch-and-a-half timber planking, bent to the required curve. A familiar example is to be found in the roof of Charter-house, which is formed of four circular ribs of deal, each one inch and a half in thickness and four inches wide. For some reason or other, saw cuts, nearly three-eighths of an inch deep, were cut in the under side of each rib. Marine glue was used in the putting of the ribs together, which was done upon a cradle centre. The rafters rest partly upon the circular ribs, and partly upon purlins, which are supported by the collar. The dimensions are—One circular rib, consisting of four thicknesses, 6in. by 4in.; purlins, 5in. by 4in.; collars, 6in. by 2in.; rafters, 4in. by 2½in.; ceiling joist, 3in. by 2in.—Architect.

[788.]—WATERWORKS AND RESERVOIRS.—There is no work of the kind "G. H." requires; but in "Weale's Quarterly Papers on Engineering" there is an excellent description of the Bann reservoirs, with plates showing the section and manner of making up the embankment. In your back numbers for last year there is a good deal of information upon retaining walls under the title "Elements of Engineering—Docks."—A Reader.

[792.]—SECTION OF ROADS.—For a road less than 15ft. wide one water table will be sufficient.—W. T.

[793.]—SHAPE OF ABUTMENT STONES.—In Gothic the shape of abutment stones in segmental arches is



usually thus: and when the abutment is small, it is generally advisable, as it throws the thrust more into the centre of the pier.—Mortar Joint.

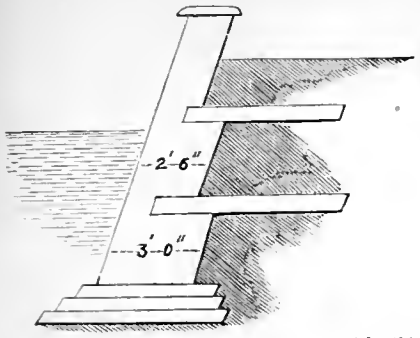
[795.]—LACQUERING SILVER.—The method of lacquering is answered by "M. M.," in the last number of Building News, No. 765. The art of making a perfectly green lacquer is lost. Rea, of Wardour street, sells the nearest approximation to it. A perfectly green tint is found in old Persian examples.

[796.]—MEASURING PROPORTIONS.—The readiest plan to do this in sketching out of doors is, when you have fixed upon your point of station, take a piece of tape tied to your coat button hole, and of such a length that a scale of (say) 12in. long tied at the end may be easily held out at arm's length, then, by carefully holding the arm at the same angle and turning round the scale, a very near approach to the proportion of the object to be sketched may be obtained.—Fred Rogers.

[797.]—HALF TIMBERED ERECTIONS.—This kind of construction may be kept quite air-tight by taking the following precautions. Let your plaster filling in finish about ¾in. behind the face of framing, run a groove in the framing coming flush with the plaster. This groove acting as a key when the timber shrinks there will be less likelihood of there being a chink to allow the weather in from the outside. Roughly plaster the inside of the brick filling in, and nail horizontal strips or battens to the wood framing, upon which the upright battening for plaster laths will come, and thus, by presenting a jacket of air between the outside and inside, you get the advantage of a hollow wall.—F. R.

[798.]—DECAYED STONE.—The plan which was found efficacious at Westminster was to first cleanse the stone from dirt with a light dust brush and then lay on lightly a solution of shellac in spirits of wine. This will prevent decayed stone from becoming worse inside a building.—I. P.

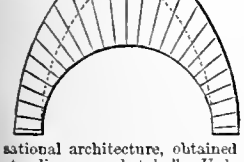
[802.]—A SEA WALL.—I would inform "Alexander" that a strong sea wall may be built, as shown in the accompanying sketch. After putting in a good solid foundation,



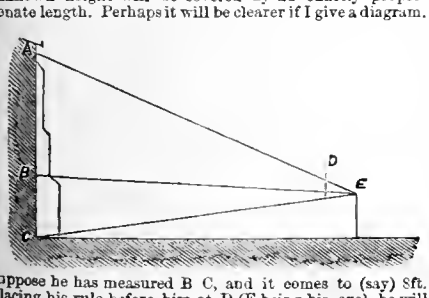
carry up your wall for three feet four or five bricks thick, then lay in a 3in. stone slab to project two feet on to a good bed of earth or concrete; then carry up the wall for four feet more three and a-half bricks thick, when another slab must be laid in, projecting 18in. or 20in. On the top of this last slab you may carry up your wall to the required height. This plan has been adopted in many docks and other sustaining or wing walls with great success, the various sets off at the back forming counterforts, which, by the downright pressure of the earth above them greatly strengthen the wall. Bricks to be laid in best Portland cement.

"Alexander" may have a good concrete by taking fresh burned stone lime, ground to a powder, without slaking, in proportion of five parts of gravel or sand to one of lime. It must be well turned or shovelled together, with a quantity of water added only sufficient to slake the lime into the state of very stiff mortar. After turning the compound over once or twice, throw it quickly (as it very soon sets) into the foundation or trench from a height of eight or ten feet, where, after being slightly rammed, it should not be touched. Be careful in all cases to fill the trench close up to the sides in every part.—W. H. D., Ipswich.

[806.]—ARCHES.—In answer to enquiry last week respecting arch, I would inform your correspondent that it belongs to no period of Gothic architecture, and that, therefore, as a Goth would say, its construction is faulty. Any arch whose voussoirs will not radiate from a point, or points, from which, as a centre or centres, the intrados can be described, must be an imperfect work. The arch of which you gave an illustration should have a semicircular intrados, the pointed extrados being merely ornamental, and so much dead weight, or nearly so. There are many examples of this latter description of arch, and some of the rusticated Renaissance doorways are treated very like it. A moment's consideration will show your correspondent that, by removing the masonry below the dotted line, we cut away the very heart of the arch, and the work must fall at the crown. This way of putting work together may be practised in Victorian times, and with other frivolous means for making a sensational architecture, obtained it the name of "the hair standing on end style." Unless well watched, bricklayers will build pointed arches after this fashion.—O. W. D.



[808.]—MEASURING OLD BUILDINGS.—I can suggest to "Ecclesiologist" a very simple method for obtaining the heights of inaccessible points, which I have often used myself with satisfactory results, though I am not aware that it is generally employed. Suppose he desires to obtain the height of some point from the ground. Having already measured some accessible height, let him stand some distance off, and hold his rule upright, so that the known height shall be covered by a certain length of it; then the unknown height will be covered by an exactly proportionate length. Perhaps it will be clearer if I give a diagram.



Suppose he has measured B C, and it comes to (say) 8ft. Placing his rule before him at D (F being his eye), he will cover the 8ft. with (suppose) 2in. of it. Then, looking up to A, he will find the whole height covered by (say) 6½in., and will, therefore, assume A C = 26ft. This may be very easily proved by the sixth book of Euclid.—A. K. C. L.

STATUES, MEMORIALS, ETC.

Some three years ago a public subscription was set on foot to provide for the execution of a statue of Sir Rowland Hill. A commission was given to Mr. Peter Hollins, of Birmingham, to execute a marble statue at the price of 950 guineas, which has just been completed by him, and is now about to be sent to the approaching exhibition of the Royal Academy. The statue has been cut out of a block (three tons weight) of Carrara marble. The figure is represented in an easy standing posture, the left foot being slightly advanced, and the left hand resting on a low pedestal. In the right hand Sir Rowland holds a roll of penny postage stamps, suggesting the work on which his fame chiefly rests. The figure is 6ft. 8in. in height.

WAGES MOVEMENT.

We stated about a fortnight ago that a dispute between the builders of the Potteries district and the carpenters and joiners, as to the hours of labour, had been referred to Mr. J. E. Davis, the stipendiary magistrate of the Potteries. The masters proposed that the carpenters and joiners, who go to work at 6, and leave off at 5.30, should begin later in the winter time, and leave off at 6 all the year round. The men resisted this proposal, and Mr. Davis has decided in their favour.

The painters and plasterers of Halifax are seeking an advance of wages, and strikes are not improbable. The painters ask to be paid 6d. per hour minimum wage, the present rate being 5½d. The plasterers demand 2s. a week more, and one hour a week less labour. The masters, we believe, are endeavouring to effect a compromise.

LEGAL INTELLIGENCE.

The Chancellor of the diocese of Carlisle, in a judgment delivered in the Consistory Court, has decided that churchwardens have a right to an unrestricted access to the church committed to their care, independent of the minister; whether this should be by the custody of one key themselves, or by one key being provided for each party, he should leave to themselves. Notice of appeal was given against this decision.

ALLEGED FAULTY CONSTRUCTION OF PROPERTY.—Wilkes *v.* Longmore.—In this case, before the Walsall County Court, Wm. Wilkes, gun-lock filer, Cock-street, Darlaston, sought to recover from Isaiah Longmore, miller, of the same street, the sum of £10, for damages alleged to have been sustained by him through the erection of a flue, wilfully and improperly, adjoining the plaintiff's workshop. It was shown that one of the beams which supported the floor of the workshop passed through the wall of the building and projected beyond it to the extent of about a foot, reaching to within about six inches of the defendant's flue. On the 26th November last the projecting end of the beam took fire and smouldered away, until that part which rested on the wall was consumed. The remaining part of the beam then fell down within the building, carrying with it a part of the floor of the workshop, and causing damage to the amount, as the plaintiff estimated, of £5. He also alleged that he sustained a further loss of £5 by loss of time in seeking another place in which to work. Witnesses were called to show that it was exceedingly improbable that the beam took fire from the flue, and that, setting aside a supposition that it was ignited by a fire in a grate in the plaintiff's shop, the mischief must have been caused by some person or other wilfully setting fire to the end of the beam outside the premises. In the end the judge found for the plaintiff in the sum of £2 and costs.

Our Office Table.

The well-known "Tabernacle" in Finsbury, erected by George Whitfield about 100 years ago, is about to be demolished, the lease of the ground having expired.

It is not uncommon in Paris to find the portraits of celebrated men employed to decorate wrapping paper, and common clay pipes carry the features as well as the name of some public character. A manufacturer of porcelain now announces that he is bringing out a complete dinner set with the likenesses of the whole staff of writers of a favourite journal. This will certainly be a change from the time-honoured willow pattern and the droll-looking figures of the celestials.

The foundation stone of the fourth pier of the new Blackfriars Bridge was laid on Friday. The pier has been carried nearly up to the half-tide level, and in the third pier the four principal caissons have been sunk to the bottom and filled in with concrete, and the two end caissons are nearly sunk to the full depth. Two of the arches have also been put together, and are now in position. The bridge will probably be finished in about a year. The new bridge is to cost between £250,000 and £300,000.

A singular calamity has befallen the town of Essen, in Rhenish Prussia. The soil is sinking at several points, a new street, one of the finest in the place, being especially affected. Three houses have already been obliged to be taken down, and a fourth is on the point of disappearing. Twenty-seven others show symptoms of ruin. The cause of the giving way in the ground is unknown.

The purchase of the Gallery in Pall Mall, hitherto used for the exhibition of pictures of the British Institution, has been completed by the Duke of Sutherland and the Earl of Leicester, as trustees of a new athletic club. The sum paid was £18,000.

Some time ago a paragraph appeared in the newspapers respecting the awards of Grand Prizes for Agricultural Machinery at Paris. Messrs. Howard, of Bedford, took exception to it on the ground that the statements were both incorrect and misleading. They also attributed to Messrs. Ransome, of Ipswich, the authorship of the paragraph. A rather angry correspondence ensued, and the dispute was at length referred to arbitration, William Fairbairn, Esq., of Manchester, being chosen the adjudicator. Messrs. Ransome having admitted that the paragraph was supplied by them, Mr. Fairbairn has decided as follows:—"I find, and am of opinion, that the expression in the paragraph, 'First grand prize to Messieurs Ransomes and Sims, of Ipswich, second ditto to Messieurs James and Frederick Howard, of Bedford,' and to which expression Messieurs James and Frederick Howard object, is ambiguous and improper, inasmuch as the words first and second might give to the reader of them an erroneous impression of superiority to Messieurs Ransomes and Sims, whereas both the said firms are on an equality with regard to the grand prizes awarded. I am further of opinion that the words objected to were used inadvertently by Messieurs Ransomes and Sims, and not with any intention to mislead or to claim more than they were entitled to."

Sir J. G. Simpson, the distinguished physician, states that in the old town of Edinburgh there are 13,000 families, consisting of 60,000 individuals, living in one-roomed houses, and that 1,500 rooms are the abodes, day and night, of from 5 to 15 persons. About 120 dwellings have no windows, and 900 of them are cellars.

The conductor of one of the American lines of railway has invented an ingenious contrivance to indicate to railway passengers the station which they are approaching, its distance from the one last passed, and from that point to each terminus of the road. It is placed in the centre of the car and has two arms projecting about two feet from each side of the car, which, coming in contact with posts placed for the purpose, turn the indicator immediately after leaving each station.

Aërodomes is the name given by an architect, M. Jules Borie, to a gigantic project of his, which he states has obtained the approval of the Emperor, and it cannot be denied that it looks plausible enough. The leading idea is that the disastrous agglomeration of numberless small lodgings within a narrow space in the business quarters of large towns may be obviated, without driving the people from the scene of their daily avocations, by, on the one hand, widening the streets, and, on the other, gaining in height what is thereby lost in breadth. For this purpose the houses to be built in the new and spacious thoroughfares which are to replace the existing narrow lanes will be not less than 10 storeys high, access to the upper ones being afforded by lifts, as is already the case in many hotels, both in England and France. Iron is to constitute the framework of these vast edifices, which are to rise to altitudes of from 100 to 120ft. Let us suppose the building to occupy a large rectangle; the fifth storey will be partially surmounted by a terrace, say 10ft. broad. Above this rises what may be called a second set of houses, narrower than the basement part just described, and constituting the aërodome proper, also five storeys high, making ten in all. The basement flats would serve for shops, banking, and other offices, &c.; those above the terrace would be inhabited by the clerks and other people generally connected with the establishments below. Let us now imagine a series of these rectangular constructions, separated from each other by wide avenues; the inhabitants of the aërodomes may communicate with each other by means of bridges thrown across from terrace to terrace, and in this way we get, in fact, two towns, one above the other; a large amount of traffic will be carried on without descending into the streets at all, provisions, fuel, &c., being obtained by means of the lifts. Each aërodome may be inhabited by 1,000 people and more, all enjoying commodious apartments, a pure atmosphere, and abundance of light, while the streets below will be wide and airy.—*Galignani.*

The third meeting of the members of the Architectural Institute of Scotland of the season was held in Edinburgh last week, Mr. J. Dick Peddie in the chair. Mr. Gowans read a paper on "The Education of an Architect," in which he pointed out the subjects that ought to be studied, and advocated the endowment of a chair of architecture in the University of Edinburgh.

The following fact, given on the authority of an eminent French architect, will convey to our readers a curious idea of the value of land in Paris. A plan for a new street, to run in a direct line from the present Italian Opera to the recently-erected Opera-house, has received the sanction of the Municipal Council, and may be inspected at the Hotel de Ville. The street is to be called La Rue de l'Imperatrice. The ground has been purchased at the rate of 1,800frs. to 2,000frs. the square metre—that is from £72 to £80. The greater number of the houses to be built are already let—the lower part as shops at the rate of 20,000frs. to 25,000frs. a year (from £800 to £1,000 a year). It is true that the situation is one of the most central in Paris. The question arises, and it is a grave one, where are men of small income to lodge? As to the poor, Paris has ceased to have homes for them.

A writer in one of the magazines recommends the new metallic compound, aluminium bronze, for household plate. He thinks it rather singular that this metal is not more used in England. We know it best in the cheap pencil cases which come from America, but there is no metal which it is alleged is so well suited for many domestic purposes. "I suppose," says this writer, "that our plate is chiefly of silver, not because it is one of the precious metals, and we wish to make a show of our wealth, but because it is a clean, hard, useful, and beautiful metal, easily kept in order. Its preciousness is a positive disadvantage to it, because it entails upon us some extra trouble in guarding it; and many persons, to save themselves this worry, refuse to have silver, and take to electroplate. Electroplate is certainly as hard, as cleanly, and as beautiful as silver, and it has the advantage of not being tempting enough for thieves; but it is unreal—too much like the thing it imitates, and many people reject it on that account. To all such persons let me say, Try the aluminium bronze. It has all the beauty of gold, without any pretence of imitating it. You know it is not gold by the weight of it; and no one has a word to say against the metals which in tint resemble gold—as brass, because they are not deceptive as the resemblances of silver. For articles in aluminium bronze, however, we should have to go to Paris. They are not made in England. Spoons and forks, cruet-stands, candlesticks, harness, and many other things in this beautiful substance, figured prominently in the Paris Exhibition."

At the quarterly meeting of the Conservative Land Society yesterday, at the Norfolk-street offices, Viscount Ranelagh in the chair, the secretary, Mr. Grunesen, submitted the report of the executive committee, which stated that the receipts for the half-year at Lady-day amounted to £105,217 3s., and the grand total to £1,205,820 10s. 9d. The £50 shares issued were 29,142, being a subscribed capital of £1,457,100; the withdrawals on which had been £316,162. The sale of land to Lady-day, 1868, was £545,777, and the reserve fund was £12,051. The society had acquired three new estates; the first was at Northampton, the second at Holloway, and the third at Red Hill (Surrey). The report stated that the new United Land Company (Limited) had been incorporated to co-operate with the Conservative Land Society, the former under the Joint Stock Companies' Acts, and the latter under the Friendly Societies' Acts as usual, and the shareholders were congratulated on the prospects and position of the new undertaking as an adjunct to the present institution.

We mentioned a week or two back that the lime light was about to be introduced for the purpose of illuminating the soldiers' barracks at Perth. The arrangements are being rapidly proceeded with, the principle adopted being the same as that known as the Drummond light. Various towns in Scotland are adopting the light, and if, as will doubtless be the case, the experiment at Perth proves satisfactory, it is expected that the lime light will gradually supersede the use of gas.

The late Mr. Felix Slade, whose death has just occurred, was well known as a collector of exquisite works of art. It is stated that he owned "the finest private collection of glass in Europe, but that in this respect he had a formidable competitor in Mr. E. W. Cooke, R.A."

According to a return furnished by the engineer of the Metropolitan Board of Works, the average daily quantity of sewage pumped into the River Thames at the Southern Outfall Works, Crossness, during the past week, was 54,563,859 gallons, or 247,909 cubic metres, equivalent to about as many tons by weight.

Mr. John Johnson, the successful competitor for St. Andrew's Church, Hertford, says in a letter to us:—"I am a total stranger to the committee, so that the decision is perfectly impartial. I did not canvass for a vote, although I understand some of the other competitors did."

Mr. Chauncey Hare Townsend, the friend of Southey, and well known as a man of letters and a lover of art, who died recently at his house in Norfolk-street, Park-lane, has by his will made several valuable and interesting bequests for the benefit of the public. He bequeaths to the President of the Council for the time being, for the benefit of the South Kensington Museum, such of his pictures, water-colour drawings, and engravings as the Lord President may select; also his collection of Swiss coins and his boxes of precious stones and cameos, together with the ancient gold watch which, having been stolen by the celebrated Barrington, was the cause of his transportation; also the looking-glass and frame over his drawing-room chimneypiece, carved by Grinling Gibbons. The articles thus bequeathed are said to be of great value. The only conditions that he attaches to this gift are that the articles may not be sold or exchanged, but publicly exhibited. The rest of his pictures, drawings, engravings, books, curiosities, and objects of vertu are given to the Wisbech Museum. The residue of his personal estate is devoted to founding a school in or near London for educational purposes, of the humblest and simplest kind, upon a plan to be settled by the Bishop of London. Besides being an elegant poet, the late Mr. Townsend was an accomplished musician, and sang the songs of his own composition with a high degree of grace and expression. He drew and painted with no mean skill. He was a lover of art, and a collector of rare judgment and exquisite taste. Every house in which he lived had, indeed, the interest of an art museum.

The architect Northoff, of Dresden, has designed a new font and cover for the new church of Oberwiesenthal in Saxony. An engraving is given in the *Christliches Kunstblatt* for December, 1867. The font has an octagonal bowl, very much after a common English type, with octagonal stem and base. The most novel feature is a metal crane, very well designed, which stands close to the font, in order to suspend and swing off the cover.

Arrangements are in progress for giving practical effect to the resolutions of the conference of working men, held on the 14th ult., under the auspices of the Working Men's Club and Institute Union and the presidency of the Earl of Lichfield. The consents of Dr. W. B. Carpenter, F.R.S., and Professor Warrington Smyth to deliver lectures, together with conditional promises of co-operation from several equally distinguished men of science, have been obtained.

The Dead Letter Office at the London Post Office is not the only curious place in the world. The same establishment at Washington would seem to be as great a curiosity shop. A New York paper states that the property clerk of the Dead Letter Office at Washington is now arranging in show cases, for public exhibition, upwards of a thousand articles of value and interest which have from time to time been received, and yet remain unclaimed. Among the articles and fragments is an elaborately wrought collar, evidently the property of a lady, to which is attached a note with the inscription "Burned in the cars between Fort Mayno and Chicago, Feb. 5, 1868." There is also a square of gun caps, found with fifty other squares, quilted in a lady's skirt, on the occasion of Sherman's march to the sea. The cartes de visite and photographs of soldiers in the Dead Letter Office number about 15,000, and they are being placed in portfolios for exhibition and public identification.

The ancient gold work, dating as early as the fifth century, exhibited at Paris, and lent by the Roumanian Government to the South Kensington Museum, will only remain on view for a few days longer before its return to Bucharest.

Earl Grey has given notice of his intention to move, in committee on the "Regulation of Railways Bill," the insertion of clauses imposing penalties for the emission of opaque smoke by railway engines required by the law to consume their own. The station master in the district in which the offence is committed is to be the nominal defendant.

The Rivers Commission, after taking evidence for two years, seems to have been broken up by dissension among its members, or probably owing to a disagreement between Mr. Rawlinson and Mr. Harrison. At all events the commission has been dissolved, and a new one constituted. It includes, we believe, Mr. George Denison, Mr. Norton, and Dr. Frankland. The former commission consisted of Mr. Rawlinson, Mr. Harrison, and Professor Way.

We have received the following letter:—Sir,—I beg to call your attention to the new lights at the Euston Station in the large hall. They are Kidd's patent carburetted gas sunburners. The gas formerly used to light the hall was about 230ft. per hour, the new lights consume under 200 cubic feet per hour, and about one gallon of the carburetting fluid in a week, the cost of which is 7d.—I am, &c., Arthur Barff.

The thirteenth meeting of the session of the Liverpool Architectural Society was held last week, Mr. Kilpin, the president, in the chair. Mr. Shoolbred exhibited several large photographs, principally of buildings in Spain, of great interest. Amongst them were views of Burgos Cathedral, the hospital of Toledo, the Alhambra, the Alcazar at Seville, the cathedral of Salamanca, &c.—Mr. Boult exhibited a photograph of the statue intended to be erected in St. George's Hall of Mr. Joseph Mayer. Mr. Boult said he had received it from Mr. Fontana, the sculptor, and it had been taken from the plaster cast of the statue, which was now being transferred to the marble. Mr. Boult further said he wished to inform the members of the society that contributions for the forthcoming architectural exhibition must be delivered in London on the 8th and 9th of the present month. Mr. Batty, of Manchester, read a paper on Vault Architecture, and received a vote of thanks for the same.

MEETINGS FOR THE ENSUING WEEK.

Wed.—Society of Arts.—"On Liquid Fuel," by Benjamin H. Paul, Esq.
Sat.—Associated Arts Institute, Committee Meeting.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

2274 M. JONES. Improvements in Kitchen Ranges. Dated August 6, 1867.

The patentee claims constructing and arranging the flues of the top and bottom ovens of kitchen ranges, and combining the said flues with independent vertical back flues, substantially as described, whereby one or other or both of the ovens may be heated at pleasure, and the quantity of heated air circulating about them regulated.—Patent completed.

2329 J. BADGER. Improvements in Kitchen or Cooking Ranges. Dated August 13, 1867.

The patentee claims, first, constructing and arranging or combining the parts of the fire-grates of kitchen or cooking ranges so that the fire-grate may be raised or lowered in the fire place, and fixed or supported at the required height, in order to increase or diminish at pleasure the depth or fire space of the grate. Second, opening and closing the chimney hole of the range, and forming a draught plate or box at the said chimney hole when the grate is an open one, by means of a door constructed and used substantially in the manner described.—Patent completed.

2332 T. WALKER. Improvements in Machinery for Cutting Grooves in Notchboards of Stairs, Ladder Strings, and in other Articles Requiring such Grooves. Dated August 13, 1867.

Here the patentee employs arms mounted so as to be capable of being turned to any required angle, and connected together by suitable rods, which are carried by sliding pieces mounted on the arms. The material to be grooved is placed upon the rods, and is moved against a revolving cutter situate above, and is traversed along rollers or other guides for successive cuts. The distances apart of the grooves are regulated by a gauge piece which is mounted so as to be capable of being turned upward and downward upon a centre, and is placed in one groove to determine the position of that which is to succeed it. The gauge piece is also capable of being moved horizontally.—Patent completed.

2296 R. HEATHFIELD. IMPROVEMENTS IN MACHINERY FOR THE MANUFACTURE OF CUT NAILS. (A communication.) Dated August 9, 1867.

This invention relates to the "feeder," which consists of a tube slightly inclined, the end nearest the cutter being lower than the other end. Through this tube the strip of metal from which the nails are to be cut is passed, and to the tube an alternating motion of partial rotation is given in the ordinary way. To the end of the tube, and on one side thereof, an arm is fixed, parallel to the axis of the tube. The extreme or free end of this arm is bent at right angles, and as a slot or opening made in it, through which slot or opening the strip of metal passes. The outer end of the tube, or the end most distant from the cutter, is supported in a bearing which allows the tube a slight motion in a vertical plane. The inner end of the tube is pressed upon by a spring, the end of the spring being formed into a clip or bearing. The action of the feeder is as follows:—The strip of metal fed through the tube and slot or opening in the arm, is urged forward towards the cutter in the usual manner; after one nail has been cut from the strip, the tube performs a semi-rotation, the end of the arm bearing on the bed of the machine, and constituting an oscillating centre about which the rotary motion is performed. The inner end of the tube, together with the arm and strip, consequently rise and fall in a vertical plane during the semi-rotation of the tube, the tube and arm being pressed down to the bed plate, and lateral motion in them prevented by the spring described. The action of the feeder is, after each nail has been cut from the end of the strip, to turn the strip at the same time, slightly raising it, and bringing it down again in the same position upon the bed plate, the motions being very similar to those effected by the human hand in hand-fed nail-cutting machines.—Patent completed.

2297 C. HOHGREFE. IMPROVEMENTS IN APPARATUS TO BE APPLIED TO CHIMNEY TOPS. Dated August 9, 1867.

Here the patentee employs a series of funnel-shaped rings having an inner diameter corresponding with the width of the chimney. These rings are fixed horizontally, and one above the other, with their mouths downwards, and with spaces between them. Their surfaces are curved so that the wind blowing against them horizontally becomes deflected upwards in a vertical direction, and the ascending current of air so obtained tends to draw the smoke out of the chimney.—Patent completed.

2351 A. F. BAIRD. AN IMPROVED EARTH CLOSET. Dated August 15, 1867.

Here the patentee places a receptacle beneath the seat for receiving the deposits with which the earth is to be mixed, with a shoot or passage opening into the said receptacle for conveying the earth into the same, and at the other end to that above-mentioned another opening by which the earth is supplied from a hopper to the said shoot; the bottom of this hopper being curved and provided with the last mentioned opening for communication with the shoot, is opened and closed by the action of a sector piece or other valve weighted as a counterbalance, such piece or valve being secured to, and forming part of, a flap or valve hung at the centre, the office of which flap or valve is to close the opening from the shoot into the receptacle first mentioned, the same being effected by means of a projection from the centre of the said flap or valve situate just beneath the seat of the closet, so that, when at rest, the sector valve closes the entrance from the hopper to the shoot, and prevents the discharge of earth into the said shoot; and when the closet is used, the weight of the "sitter" presses the seat on the said projection, and thus gives motion to the valve arrangement and opens the entrance from the hopper to the shoot, shutting the entrance to the receptacle for deposits, thus causing the shoot to be filled up with earth, which is to be discharged therefrom into the receptacle by the removal of pressure of the "sitter" getting up from the seat. The sector valve has a rod or rods attached to it, working in the hopper, to prevent the consolidation of the earth, and cause it to remove as required. —Patent completed.

2437 W. R. LAKE. A NEW GREEN COLOUR. (A communication.) Dated August 26, 1867.

This invention consists, principally, in the employment of linseed oil, acid, and oxide of copper. It is produced by precipitating a neutral soap prepared from linseed oil with a dilute solution of copper, or in letting linseed acid act on oxide of copper, or a combination, consisting partly of oxide of copper. Oleic acids produced from other oils also furnish the said colour in divers shades.—Patent abandoned.

2461 J. DOUGLAS. IMPROVEMENTS IN THE MEANS OF VENTILATING AND REGULATING THE DRAUGHT OF CLOSE FIRE RANGES OR KITCHENERS. Dated August 29, 1867.

Here the patentee makes an aperture at any suitable point in the front or side of the range above the fire, and communicating with the flue. This opening he provides with a door or flap, hinged or otherwise mounted, of a size to fill up the whole area of the flue; this flap is held in any suitable position by a bent arm attached thereto, having teeth or notches catching in a guide fixed at the upper part of the aperture; or it may be otherwise arranged to hold the flap more or less open, as desired. By adjusting the position of the flap, which acts both as a ventdator and damper, the draught in the flue may be regulated according to the requirements.—Patent completed

2464 J. and R. D. PAULIN. IMPROVEMENTS IN APPARATUS FOR FEEDING PAINTS ON THE STONE OR STONES ON WHICH THEY ARE TO BE GROUND. Dated August 29, 1867.

The patentees make a receiver for the paint of any convenient size, form, and material, within which, and at the bottom thereof, is a knife (by preference double curved) revolving on its spindle; at the side of the receiver is an opening with arrangements for closing the same to a greater or less extent, as may be desired. The knife during its revolutions pushes some of the paint through the opening in the side of the receiver into a box. Another knife moved by a crank at the proper time cuts off that portion of the paint which projects from the receiver into the box, and in travelling back to its former position carries such portion of paint to a position immediately over or communicating with the eye of the stone; and provision is made for raising the knife preparatory to its being moved again towards the receiver, so that the paint is dropped which falls or is conveyed into the eye of the stone.—Patent completed

2481 E. K. DUTTON. IMPROVEMENTS IN WINDOW SASH FASTENERS, WHICH ARE ALSO EMPLOYED TO SUSTAIN THE WINDOW SASHES IN ANY DESIRED POSITION WHEN THE WINDOW IS OPENED. (A communication.) Dated September 2, 1867.

Here a lever works in a "frame" or "fixing" of a suitable form and material, the fulcrum of the lever being nearer to one end than the other, the shorter end of the lever having been suitably formed to have attixed thereto a pad of caoutchouc, &c., and the longer end of the lever being suitably shaped to be operated upon by the hand. The frame and lever are affixed to the side of the "sash frame," or so let into the same that the pad of caoutchouc is pressed against the fixed window frame in which the sash slides, a spring operating upon the lever to give the said pressure; when the window is closed, a projecting portion of the lever enters a slot in a metal plate affixed to the window frame and effects the desired fastening.—Patent abandoned.

2485 A. V. NEWTON. AN IMPROVED MANUFACTURE OF TOOL FOR CUTTING STONE. (A communication.) Dated September 2, 1867.

This invention relates to a novel saw or rotary cutting tool. The edge or periphery or perimeter of the cutting tool is studded with small precious stones of great hardness or pieces thereof (diamonds being preferred), the same being so disposed that the stones shall form the cutting edges or points of the saw, some of them projecting on either side of the saw plate to cut a "kerf" sufficiently wide to keep the plate from binding in the kerf.—Patent completed.

2486 H. VALLANCE. IMPROVEMENTS IN FASTENINGS SUITABLE FOR CASEMENT WINDOWS. Dated September 2, 1867.

The patentee claims combining with the latch fastening of a casement window a rod passing along the frame to a pin or bolt locking with a quadrant, in such manner that the movement of the latch handle is communicated to the said locking pin or bolt, as described.—Patent completed.

2494 E. Y. ROBBINS. IMPROVEMENTS IN FIRE-GRATES. Dated September 3, 1867.

This invention consists in forming the front of the grate basket, or part of the grate in which the fuel is held, concave in its horizontal or vertical, or in both its horizontal and vertical sections, so throwing the fuel into such position that there is cross radiation from one part of the front of the fuel upon another part, keeping the entire front surface of the fuel hot and brightly incandescent; also forming a highly heated channel of draught, drawing up smoke and the dust of ashes into the flue, this channel of draught being entirely within the fireplace or stove, and the bars so shaped that any smoke coming from the fuel between the bars is under the arch and within the jambs, and not likely to get into the room.—Patent completed.

2498 G. SMITH. IMPROVEMENTS IN LADDERS SUITABLE FOR FIRE-ESCAPES AND OTHER PURPOSES. Dated September 4, 1867.

According to this invention the inventor combines two or more ladders, according to the amount of extensibility required, disposed one within the other, the inner ones being capable of sliding in the outer ones. The outer ladder of the series is pivoted or carried on hinges or centres at its lower end, such centres being fixed on a carriage mounted on wheels for the facility of transport. There are various other features comprised in the invention. —Patent abandoned.

Turner (accepted.)	1899 15 0
Callen and Co. (too late)	1825 0 0
Teece (withdrawn)	1744 18 7

GODSTONE.—For completing three houses at Godstone. Mr. William Eve, architect:—

Heiser	£650
Sawyer (accepted)	625

GUILDFORD.—For road making and drainage, on the Woodbridge-road estate, Guildford Mr. Henry Peak, architect and surveyor. Quantities not supplied:—

Watkins	£675 0 0
Garnett	609 0 0
Ayers (accepted.)	473 11 0

LONDON.—For alterations at No. 1A, Hyde Park Gate, for J. R. Haigh. Mr. Thomas Hill, architect:—

Mansfield and Price	£740
Patman and Fotheringham	728
Nixon	647
Eboralo	682
Saunders (accepted)	610

LONDON.—Rebuilding No. 29, Mark Lane. Messrs. John Young and Son, architects, 35, King-street:—

Lawrence and Sons	£6320
Ashby and Horner	6170
Hart	5900
Ashby and Sons	5823
Webb and Sons	5743
Brass	5634
Henshaw	5599
Conder	5560
Newman and Mann	5539

LONDON.—New warehouse, No. 34, Gutter Lane. Messrs John Young and Son, architects:—

Lawrence and Sons	£3770
Mansfield and Price	3524
Hart	3498
Patman	3392
Myers and Sons	3358
Brass	3330
Webb and Sons	3330
Newman and Mann	3246
Ashby and Horner	3197
Henshaw	2965

LONDON.—New building, Great Tower street. Messrs John Young and Son, architects:—

Jackson and Shaw	9500
Ashby and Sons	9450
Mansfield and Price	9303
Browne and Robinson	9124
Henshaw	9050
Ashby and Horner	8840
Conder	8475

LONDON.—For rnising warehouse, 107, Leadenhall-street. Mr. Will am Eve, architect:—

King and Son	£658
Greenwood and Son	565
Heiser (accepted.)	510

REIGATE.—For a pair of semi-detached cottages to plans and specification of J. F. Mathews, Reigate. Quantities supplied:—

Mr. Peters	£498 0 0
Scraggs	420 0 0
Holdsworth	392 0 0
Wentworth	339 10 0

SNARESBROOK.—For erecting two cottages in the Sylvan road, Snaresbrook, for Mr. Rowbotham. Mr. F. G. Widdows, architect:—

Hunt and Elkington (accepted)	£1100

STOKE NEWINGTON.—For rebuilding premises, High-street, Stoke Newington, for Mr. S. Brampton. Mr. F. G. Widdows, architect. The quantities supplied by the architect:—

Patrick and Son	£7 119
Rivett	6 993
Cooder	6731
Brass	6643
Ashby and Son	6616
Newman and Mann	6556
Henshaw	6459
Hill and Keddell	6360
Ennor (accepted)	6346

THEYDON BOIS.—For enlarging house at Theydon Bois. Mr. William Eve, architect:—

Turner	£365
Cuthbert Brothers (accepted.)	275

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

William Bull and Richard Jeffery, Tunbridge Wells, builders, April 20.—Alfred J. Cohen, Gloucester street, Clerkenwell, timber dealer, April 24.—John Davis, Aldershot, contractor, April 28, at 2.—James Price, Barking, bricklayer, April 29, at 11.

TO SURRENDER IN THE COUNTRY.

Thomas, Griffiths Burslem, plasterer, May 9, at 11. —Charles Field, Hereford, bricklayer, April 21, at 10.—John Simpson, Liverpool, builder, April 16, at 3.—James Soper, Plympton Saint Mary, builder, April 18, at 11.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

April 20, W. Davies, Lennox road, Islington, builder.—April 22, W. H. James, Warren street, Fitzroy square, builder.—April 27, W. A. Hammon, Howland mews, Howland-street, builder.—April 23, W. Linfott, New Barnet, timber dealer.—April 30, W. J. Burgis, Sutton, stonemason.—May 4, T. Spooner, Burton upon Trent, surveyor. April 14, J. Nutton, Elland, contractor.—May 8, J. Hodgetts, Staplow-wharf, near Ledbury, timber dealer.—April 27, G. G. Hughes, Everton, builder.—April 20, B. Pritchard, Liverpool, builder.—April 28, G. Patchett, Eccleshill, stonemason.

DECLARATION OF DIVIDENDS.

R. Whiston, Wolverhampton, lime merchant, div. 1s. 2½d.—J. Best, Seaforth, builder, div. 1s. 3d.

DIVIDENDS.

April 22, S. Randle, J. Corrie, and G. Penton, Sydenham, builders.—April 21, C. Rooke, Blandford Forum, builder.

SCOTCH SEQUESTRATION.

James Dunbar, Lillierleaf, mason, April 11, at 12.

PARTNERSHIPS DISSOLVED.

Peters and Markham, King William-street, E.C. surveyors.—Garstang and Gornall, Blackburn, house, Morley, stone merchants.—Knight and Gosling, Birmingham, timber merchants.

THE BUILDING NEWS.

LONDON, FRIDAY, APRIL 17, 1868.

THE NATIONAL PORTRAIT EXHIBITION.

THE Exhibition-road, South Kensington, has once more become a centre of attraction to the public. Favoured by fine weather, thousands of persons are now flocking thither to view the third and concluding Exhibition of National Portraits. And it must be said that the inducements to pay a visit to this well-known spot at present are very great. A splendid collection of portraits has again been brought together, and we may renew our thanks and congratulations to the enlightened nobleman for a happy suggestion, and to the managing committee of the undertaking on account of the immense success which has attended their efforts. The Exhibition was opened to the public on Thursday, and for the next few months the large and externally rather unpromising-looking brick building used for the refreshment rooms of the International Exhibition of 1862 will doubtless prove one of the most fashionable resorts and places of popular attraction in the metropolis. The gardens of the Horticultural Society, being in close proximity, may be supposed to lend an additional attraction to the Exhibition. The National Portrait Exhibition, as most persons are aware, is specially designed to illustrate English history and the progress of art in England. Lord Derby's idea, as he himself expressed it, was "to admit either portraits of eminent men (and women) though by inferior or unknown artists, or portraits by eminent artists, though of obscure or unknown individuals." This idea has been followed out in the series of exhibitions which have been held, and the present collection completes the chronological series suggested by Lord Derby. It consists of celebrated persons who have died since the year 1800, with supplementary portraits of many distinguished individuals not duly represented in the Exhibitions of the two previous years. The collection of modern portraits extends from the commencement of this century to the present time, and includes the last twenty years of the reign of George III., the ten years comprising the reign of George IV., the seven years of the reign of William IV., and the first thirty years of the reign of Queen Victoria. In an introductory note to the catalogue, Mr. Samuel Redgrave informs us that the first year's exhibition was distinguished by the works of the great foreign artists who had followed their profession in this country. The second exhibition contained the portraits of the founders of the English school of painting, culminating with those of Reynolds and Gainsborough. The present largely represents the works of Sir Henry Raeburn, who died in 1823; William Owen, who died in 1824; Sir Thomas Lawrence, who died in 1830; John Jackson, who died in 1831; Thomas Phillips, who died in 1845; Sir Martin Shee, who died in 1850; and Sir J. Watson Gordon, who died in 1864. It also comprises examples of eminent contemporaneous artists, who now sustain the reputation of the existing school of portrait art. In 1866 the number of portraits exhibited was 1,030; in 1867 the number was 866; and this year the collection includes 946. It will thus be seen that no fewer than 2,842 portraits or portrait groups have been exhibited in the three years. This is a splendid result, and the managers of the undertaking may well congratulate themselves on the fact that the known portraits of our most eminent men, with few exceptions, as well as the art of our best portrait painters, have been fairly represented in these exhibitions. But they also state—and we may take hope for the future from the statement—that it must not be assumed that the stores of portrait art possessed in this country have by any means been exhausted. The portraits offered when it was too late and impossible to accept them are mentioned as some proof of this. Indeed, the number, we are told, seems almost without limit. In the meantime, let us be thankful for what has already been accomplished. Never before have so valuable, interesting, and extensive collections of portraits been gathered together for public exhibition. Contributions have come from many sources. Her Majesty has lent her gracious aid; important contributions have been made by the principal families in the kingdom, by our universities, and by other corporate bodies and national institutions.

Among the more interesting features of the present exhibition is the fine series of portraits belonging to the Dilettanti Society. This society was established in 1734 by several noblemen and others (Viscount Harcourt, Lord Middlesex, and the Duke of Dorset being the chief promoters), who were desirous of advancing the fine arts in Great Britain. The society consists of fifty members, and in 1740 it was ordered "that every member do make a present of his picture, in oil colours, done by Mr. George Knapton, a member, to be hung up in the room where the Society meets. Twenty-three portraits were painted by this artist, and others by Reynolds, Lawrence, West, and Shee. These portraits have been appropriately arranged together, and in themselves form a most interesting exhibition. It may also be noted that the specimens of early English art include the celebrated portrait of Richard II., from Westminster Abbey. This portrait, described as the most important contemporary representation of any English sovereign (1366-1400), used to hang in the Abbey above the Lord Chancellor's pew, on the south side of the choir, next to the pulpit. It was removed in 1775 to the Jerusalem Chamber, where it has hung ever since. It is believed to represent the King enthroned, on the Feast of the Translation of King Edward the Confessor. The portrait is large life size, throned, in royal robes, wearing jewelled crown, minever tippet, minever lined purple robe, inner robe diapered with a crowned R., globe in right hand, and sceptre in left—panel 7ft. by 3ft. 7in. It was first exhibited at Kensington in 1866, and has since been cleaned under the superintendence of Mr. George Richmond, R.A. The comparatively modern painting that concealed almost every part of the original portrait has been removed with complete success, and there now remains the genuine contemporary work of the 14th century. It was one Captain Brome, Walpole tells us, who was Goth enough to repaint over the surface of this wonderful picture, somewhere about a century before his day. These galleries contain numerous examples of the elder masters of portraitnre, —a series of works in which the portrait art of this country may be traced from the time of Holbein to the present day, including the works of Antonio More, Vansomer, Jansen, Vandyck, and his followers, as well as those of our own countrymen, Reynolds, Gainsborough, Romney, Lawrence, and Raeburn. The works of these modern masters will doubtless afford the greatest gratification to the general run of visitors to the exhibition. In a very large number of instances they are the portraits of persons more or less known to this generation; not a few of them, as Lord Palmerston, Thackeray, Cobden, Sir Benjamin Brodie, Faraday, Brewster, Whewell, not to mention others, are but recently dead, and the general public will be in no doubt as to their portraits. But, indeed, it may be said of the vast majority of the individuals here represented that engravings have rendered their features familiar to most persons. We have poets, statesmen, actors, painters, sculptors, historians, wits, and beauties without number, and with most of them the visitor will be able to claim at least a historic intimacy.

For the present we pass over the majority of the great men and the distinguished women who are here represented. We notice, however, with pleasure that the Exhibition is enriched with a goodly number of portraits of eminent architects, engineers, and other scientific celebrities. For example, there is a portrait of the elder Pugin, by Mr. Herbert, R.A., in the mediæval style. This is very quaint and curious, and presents a striking contrast to the fine, jovial, eminently English portrait of Sir Charles Barry, his friend and fellow worker, which hangs right opposite—though, we may add, not in opposition. This latter portrait has been lent by Mr. Charles Barry, and the artist is Mr. Bradley. Mr. Sydney Smirke has sent a faithful likeness of his brother Sir Robert Smirke, the work of Mary Smirke. Sir Thomas Lawrence's portrait of Sir Jeffrey Wyatville, R.A., the property of the Queen, graces another wall. Wyatville died in 1840, at the age of 74. He was the son of Joseph Wyatt, of Burton-on-Trent, and at an early age was apprenticed to his uncle, Mr. Samuel Wyatt, the architect of the Trinity House. In 1823 he was made A.R.A., and next year was appointed architect for remodelling Windsor Castle, when he assumed the name of Wyatville. He was made R.A. in 1826, knighted in 1828, and died in the Wykeham Tower of Windsor Castle in 1840. Another distinguished architect, bearing the name of Wyatt, is represented, though the artist of the portrait is apparently not known. This is Mr. James Wyatt, the architect of Fonthill Abbey, and the successor of Sir William Chambers as surveyor-general of the Board of Works. He was born in 1743, and died in 1813. This portrait is lent by the Institute of British Architects, which body also contributes a portrait by Boxall of the late Professor C. R. Cockerell, R.A., who died in 1863. There is a portrait of Joseph Bonomi, the Italian artist, who settled in London about 1767, who became the friend of Reynolds, and built the Duke of Argyll's palace at Roseneath, Scotland. He died in 1808. The painter is J. F. Rigaud, R.A.

Beyond placing the portraits under separate reigns, no regular arrangement has been followed. But the visitor, as he saunters through the rooms, will come upon Pickersgill's portraits of Faraday and Dr. Brande, Sir Watson Gordon's benign-looking portrait of Sir David Brewster, the rugged and determined head of Hugh Miller, by Bonnar, Horsley's portrait of Brunel, and George and Robert Stephenson, by W. Daniels and H. W. Phillips respectively, with many others of lesser note. There is a portrait of Thomas Gray, the "Railway Pioneer," by Richard A. Clack. This interesting character, who was born at Leeds in 1788, conceived the idea of a general iron railway for Great Britain and Ireland, which he developed in his work on "Land Steam Conveyance," and "Observations on a General Iron Railway," published in 1819-20. He was ridiculed by the public press, tried in vain to get employment after the railway system had been introduced, and died forgotten and neglected at Exeter in 1848. Hanging next to it is Boxall's portrait of Aaron Manby, C.E., who planned the first iron ship that ever went to sea, and was the inventor of the oscillating cylinder marine engine. Interesting, also, is a portrait of Charles Lamb and his sister Mary, taken in old age. The figures are full length, small size, and are a little odd-looking. Charles Lamb is seated, and his sister is standing at his right hand; the canvas is signed "F. S. Carey," the picture being the property of Mr. J. Bertrand Payne. No. 802, "Sarah Malcom," by William Hogarth, will attract the attention of every visitor. It is the full-length figure of a woman in prison; she is seated at a table, on which is a rosary, and having her arms crossed. This woman, who here finds herself in such good company, was a notoriously bad

character. On referring to the catalogue, we read that she was born at Durham about the year 1711, of a family possessing some independence, but her father's extravagance left her without the means of support. She became at the age of twenty-two a laundress at some chambers in the Temple, and acted as charwoman to Mrs. Lydia Duncomb, in Tanfield-court. On the morning of Sunday, February 4, 1733, she entered their rooms and murdered Mrs. Duncomb, another elderly woman, her companion, and their servant maid. For these crimes she was executed opposite Mitre-court, Fleet-street, on March 7th following. Sarah Malcom, however, does not find a niche in this collection on account of her character, but because of the famous painter who has given us her portrait. With very different feelings will the visitor contemplate Wilkie's full-length portrait of George the Fourth, dressed in Highland costume. This is the only ludicrous thing in the Exhibition. One gazes at the effigy of the withered and broken-down old king with pity not unmingled with contempt. George the Fourth, at the age of sixty-eight, in the character and costume of a Scottish chieftain, can hardly be regarded as a pleasant object for contemplation. "Full-length heroic size"—the description reads like a satire. At all events this picture hardly adds to the value of the Exhibition, and its loss would never have been felt.

THE AMERICAN INSTITUTE OF ARCHITECTS.

IT will be interesting to the art public in this country to know what architects are doing in the United States of America. Though the citizens of that country are a go-ahead race, though they are equal to us in many things, and superior to us in some, and though they frequently do a thing whilst Englishmen are thinking about it, they are behind us in architecture. We suppose that no people, however energetic they may be, can attend to *all* the great matters which advance and dignify life at the same time. During the palmy days of architecture, science and commerce, colonisation and freedom absorbed but little of the energy of man. There was no House of Commons in those days, or certainly not as it exists now, to fire the ambition and to engage the attention of so many of the greatest men in the country; and science, which at the present time attracts into the studio or the laboratory such a large proportion of the most gifted of our race, was not then born. There are, we suppose, in every age a certain number of men who possess the power to soar above their fellows. No doubt these men multiply as education becomes more universally distributed. But universal education will not indefinitely multiply great men; it will only give those who possess the natural ability a better chance of developing it. If the chief minds of a nation are devoted to literature or science, or politics, or colonization, or government, the art of a nation will be neglected. This has been to a large extent the case in the United States. Inferior to no nation, and, perhaps, on account of their superior privileges, superior to all, they have been too much engaged in rooting up forests and planting corn, in building cities as if by enchantment in places where a short time since the foot of civilization never trod, and in laying the foundations of a commonwealth which is in all probability destined to become the greatest and perhaps the most enduring this world ever saw, to pay much attention to art matters. Their chief men have been law-makers, lawyers, statesmen, orators, preachers, and inventors. Hence architecture has charmed but a few minds of strength and influence. We find, however, from the last report of the American Institute of Architects that this is not likely to be the case in future. Architecture, like other things, is to receive its due share of attention from that active people.

The American Institute of Architects was formed about ten years since. The "Great Rebellion" interfered and sadly deranged for a few years every branch of commercial and professional pursuit. In fact, little or nothing was done towards promoting the interests of the Institute for five years. The last annual convention, which was held in October, 1867, evoked a most encouraging spirit. Besides the "central institute" there are what they term local "chapters" in affiliation with it. These chapters have each a distinct organisation and independent government. We should call them in this country branch societies. The object of the projectors of the society was somewhat different to the object of the Institute in this country. We find, on examination of the articles of its constitution, that it aimed at improvements in planning, constructing, and laying out of cities. It also aimed at effecting a change for the better wherever it was needed—"the overthrow or alteration, as speedily as circumstances or expediency might permit, of every habitation and building that should be found deficient in a sanitary or moral view of the case." A sufficiently great undertaking, we in this country would think. The American Institute is not only desirous of co-operating closely with all societies of a similar nature "on that continent," but they exhibit a strong inclination to fraternize with members of the profession on this side of the Atlantic. We therefore see that the president, in his address at the annual convention, alludes with gratification to the notice taken of their body by the London Institute of Architects; and he expresses himself warmly on the cordial reception which Mr. W. R. Ware, of Boston, received from the British Institute of Architects the latter part of last year, when he presented to that Institute a collection of photographs and other illustrative works of American architects. The president also alludes to an invitation he had received for intercourse and fellowship from the president of the Royal Society of Portuguese Architects. Such intercourse between the architects of different nations must have a beneficial effect. It not only tends to the advancement of architecture, but to the promotion of the arts of peace.

Architects in America have, it appears, similar evils to contend against as in this country, and one of these evils arises from themselves. American architects cannot agree with each other. This, we suppose, is unavoidable, as men will differ in opinion when there is no indisputable standard to test human effort. But it is not absolutely necessary that architects should unceasingly endeavour to disparage each other's works. The president of the American Institute complains of this fatal disposition on the other side of the Atlantic.

Architects complain, and very justly, of the irrelevant and hostile criticism of unprofessional men. Let them pull out the mote from their own eye before they attempt to take away the beam from the eyes of others. It is one of the most amusing things possible to hear architects pass opinions on other architects' works. They snuff out each other without remorse, and they do it with such a completeness and gusto, as if they were infallible. We suppose, however, judging from what the president of the American Institute says on the question, that this is a failing of human nature, as it exists in pretty much the same quantity and quality on both sides of the Atlantic. The evils of competition have, we may suppose, been felt even more poignantly on the other side of the Atlantic than here. The American president is so emphatic in his condemnation of the system that we can come to no other conclusion than that it has been most shamefully abused in the United States. He says:—

> I feel as if I should not fully discharge my duty to my younger professional brethren if, after my extensive opportunities and long experience, I should omit all allusion to a subject the effects of the facts of which have, according to my observation, produced much evil, and only evil, to the profession. I allude to competition—general competition—a sorry subject for architects. It burns the fingers of those who meddle with it; it is a chronic infatuation, a Will-o'-the-Wisp. It leads on the unwary to trust in the necessarily uneducated and uncertain judgment—so far as our speciality is concerned—of committees, the successes in life of whose members have, in nine cases out of ten, been gained in business pursuits, entirely out of the way of art, science, or mechanics. It blinds the competitors to every other work but their own, however weak that may be. Thus rushing pell-mell into the arena to compete for the suspended prize may be very pleasant to the lookers-on, to the committee-men, and to those of the ring, who gather up the profits; but, at the final decision, when judgment has been passed and the prize is awarded, the competitors find themselves as full of aches and sores as a whipped prize-fighter, or a chronic invalid, just breathing and no more. Now, my good friends, this species of infatuation (I can call it by no better name) should be shunned. I pray you to let general competition alone. Avoid it as an unclean thing, which can produce only heart-burning and disappointment; and by abstaining, you will give it its death-blow. But while the public see us eager to give away our wits and culture, it will be a pastime to it to throw out the bait for our anxious souls to nibble it. And we shall get but nibbling, unless it be something worse. Our time and our work are much too precious to be squandered in this manner.

It is interesting to notice that whilst some are questioning the propriety of having a fixed scale of architects' charges amongst ourselves, the American Institute have adopted, almost to the letter, the published scale prepared by the Institute in this country. A writer has recently said with some reason, "I do not pay my doctor by a percentage on my druggist's bill, nor my solicitor on the amount he can spend in retaining counsel. Yet all these things would be just as reasonable as the system of paying architects by a percentage on the builder's bill. So long as this system continues, so long will people avoid employing an architect, if they can possibly help it." This aspect of the question was considered by the Royal Institute of British Architects before they issued their scale of charges, and we now find that the American Institute, after careful consideration, have endorsed the system.

MANCHESTER TOWNHALL.*

NEXT in the race for success to Mr. Waterhouse's comes the design sent in by Messrs. Speakman and Charlesworth, and which from an Art point of view is very decidedly in advance of Mr. Waterhouse's. The style is Gothic, and of the Decorated period, but by no means an archæological transcription of any particular epoch or example. It is freely and artistically treated, and shows much originality, curbed and reined in with firmness, to prevent it running away with its rider, as it so frequently does. The centre of the Albert-square front is occupied by a triplet porch of three arches of unequal width, the central being wider than the lateral ones. These spring from a wide flight of steps, which they partially protect, and behind them rises a lofty gabled centre, having square massive wings, from which issue octagonal turrets, which seem to want a good deal more study. The main wall composition consists of a deeply recessed arcade or detached shaft, almost cloistral in its depth, having simply composed two-light windows in the background of each bay. The effect of light and shade produced by this treatment is very pleasing, and forms the charm of the design. The basement is simply treated, with square-headed windows, and the upper stage is composed of windows arranged as couplets, divided into bays by statues rising from the projecting storey beneath. Octagon angle turrets terminate this façade, and form bay windows to the rooms situated on this portion of the plan. The Princess-street and Lloyd-

* Continued from page 237.

street fronts are simply and well designed, and by their quietness contrast well with the main front, which is rather over-ornamented. The tower is well designed, and is decidedly the best in the room. Internally, the building has many picturesque bits, and the drawings showing the main entrance and mayor's ante-room are very effective compositions. The large hall is a room of noble proportions, so large, in fact, that, judging from the figures, it is a sixpenny cab-drive from one end to the other, and Stentor himself could never be heard all that long length at once. All the interiors belonging to this set of drawings show the same fault, and are rendered perfectly ridiculous by the fictitious scale thus set up, by peopling a Brobdignag building with Liliputians. The hall has a flat ceiling, and has evidently been studied with a view to acoustic effect, and we think is the only Gothic one in the room which would be useful. The planning of this design is not so good as its architectural treatment, too much space being wasted in the main entrance, which, though very grand and noble to look at, would be horribly draughty, and occupies fully one-fourth of the main front in Albert-square, severing the communication between the two wings on the first floor, and entirely suppressing it on the second. The council chamber is placed in immediate contiguity to the main hall and committee room, which treatment has much in its favour, and yet which is only adopted by this plan. This design is as superior to Mr. Waterhouse's as a work of architectnre as it is inferior in plan; and a question arises, whether it would not be better to combine the works of two architects, taking the plan of one and the elevation of another, as has been proposed to be done with the Law Courts.

Mr. Scott, junior, and Mr. Worthington both claim our attention with almost equal force; and as this is Mr. Scott's maiden essay on so large a scale, we are sure Mr. Worthington will yield the *pas* to him. The general effect of Mr. Scott's design is very Scott-ish, and there is a much greater likeness than one usually sees between the works of father and son; indeed, one doesn't quite know which is which. This design for the Townhall is very like much of the Law Courts' designs of Mr. Scott *pere*, and quite as flat. The chief feature in his main front is a very useful and well-designed porchway of two storeys, the lower one serving as a carriage entrance to the main doorway, which is on the ground floor, and the upper one as a sheltered *parvise*, from which an out-door public may be harangued. The treatment of this is very excellent, and the "get-up" of the drawing which shows it simply marvellous, and never have we seen a finer specimen of architectural colouring. The main body of this façade consists of a ground floor, divided into bays by small buttresses reaching to this stage only, and terminated on the next by statues in canopied niches. Above this, on the third storey, comes a framework of panelled marbles, of various colours, carved with ornaments in low relief—one of the most expensive ways of reaching a bad effect we know of. Firstly, our range of marbles capable of standing an ordinary English climate is but few, and fewer still of these could endure in that of Manchester; and to carve a figured marble is to spoil it, and waste both human life and labour. Up above all this runs a continuous arcade, pierced here and there with a loop-hole, which might be useful for a fusilade in the days of some future Peterloo, but for which we cannot divine any other purpose; and higher up still are dormers and a lofty roof, and, still more aspiring, an "awfully high" tower; it dwarfs everything else, and really is not a characteristic, but a caricature of Gothic art. Mr. Scott's plan has many merits; by using his ground floor for his entrance and main approach he, like Mr. Waterhouse, has the full use of the first storey for his reception rooms, which are ranged *en suite* along the Albert-square front. His main hall is different to any of the others submitted, being cruciform on plan, having shallow transepts of three bays, in which side galleries are placed. Two modes of treating this internally are shown, the one domed on pendentives, and lighted by an arcaded tambour, very like, indeed, to his father's central hall in the Law Courts, and another roofed over with timber roofs of three curvatures. The first plan would be utterly useless for the purposes of music or public speaking, the second would be nearly as bad, the length of the room not being sufficiently great in proportion to its height to admit of this treatment. The interior of the Council Chamber is shown in a most wonderful drawing, decorated in the highest style of modern mediævalism, with exaggerated miniatures stuck into the walls, and is as unfitted for the purpose of a municipal chamber in this most modern of cities as the most riotous imagination could conceive. It is a very beautiful mistake. Mr. Scott's central staircase is an admirable composition and drawing, showing an approach having a central flight of steps dividing into two lateral ones, all of rich marble, and surrounded by a cortile of columns and arches most effectively drawn and cleverly designed. As drawings, Mr. Scott's are unrivalled by any in the room; as architectural designs, they show many faults, mostly those inherent to the productions of youth, and which we rather wonder that the more experienced hand of his father has not kept down; but withal, there is so much that is good and thoughtful, so much Aladdin-like splendour, that we hail with sincere pleasure Mr. Scott's debût, and prognosticate for him the graceful bearing of his father's mantle.

Mr. Worthington contributes a very estimable design, possessing the highest merit. Much of it is exquisitely beautiful, and no praise can flatter the admirable manner in which it is "got up." His main front is like this portion of the designs of many of his *confrères*, the worst part of his work being flat and shadowless, and moreover spoiled by an exaggeratedly high plain tower. Greatly as we enjoy a bold plain treatment we find it is possible to make it even ridiculous sometimes, and much ingenuity has in this instance been wasted to achieve such a result, for here the mass is quite out of keeping with the treatment, and, instead of looking strong and dignified, it simply looks lean and hungry. Had Mr. Worthington only given us half as much of it, his designs would have been twice as pleasing, and the tower then would have accentuated his composition instead of crushing it. His treatment of the long flights of steps needed to reach his main entrance, which is placed on the first floor, is, like all else of his design, very picturesque, and instead of the usual long parallel lines at the base, we have two flights at right angles with the main building rising between a boldly treated parapet wall crowned at intervals by statues. Beneath the landing forming the junction of these is a very charmingly designed entrance to the ground floor. Although we object to external steps on principle, as being quite unsuited to an English, and particularly to a Manchester climate, yet if they are a necessity, this is the very best and most architectural way of treating them, and the beauty of it almost steals away our judgment. The treatment of the acute angles of the site is very admirably managed by forming carriage approaches under an arcaded porch-way at this point of the design. We do not know if this was contemplated in Mr. Worthington's original design, but we remarked a singularly similar arrangement in the exquisite design of Mr. Robinson amongst those rejected. Original or not, it is very excellent, and is admirably treated. This portion of Mr. Worthington's design is scenic in the extreme, and is one of the most charming studies of irregular composition we have seen for a long time; it only wants a few old burghers and men-at-arms about it to make us believe it to be a Rhenish study by Lewis Haghe. Its old worldliness may perhaps be deemed a fault, but if so it is far better than many a new-made virtue. The treatment of the narrow façade to Cooper-street is also well and ably managed, and the breadth Mr. Worthington has managed to throw into it is marvellous; in fact, from whatever point we regard this design we see great evidence of artistic skill of an unusually high range—too high indeed when we look at the tower; and Mr. Worthington's drawings exhibit the most power and thought of any in the room. His plan is very well arranged; he has not adopted the continuous corridor system so rigidly as Mr. Waterhouse and some others, but has, as it were, concentrated his offices in departmental buildings having their special entrances and general halls—a method very serviceable, and one which in work would be found to simplify the amount of searching for and running after a particular office. This will inevitably exist in the gaol-like system chosen, where a day's journey in the corridors will be required to find some official, whose oft-condemned cell is always just round the corner, but which the seeker never can get at. The interiors are not equal to the other parts of this excellent design. The main hall is bald, and, with a pointed arched wooden roof, broken only by shallow panellings, and having but few wall projections, would be a bad room for sound. There is, perhaps, a little too much space occupied by cloistral arrangements round the courts; but, taking it all in all, this design is of higher merit than the one chosen, and is one which would require less alteration to make it workable than that of Mr. Waterhouse.

These four designs are decidedly the cream of the mediæval ones sent in, the remaining two falling far indeed beneath them; and we now turn to those of Mr. Salomons and Mr. Wyatt, based upon the Classic mode of treatment. Of these, we are inclined to give the premiership to that of Mr. Salomons. This is inspired by a study of modern French works; and, in fact, is so very like a French *projet*, both in design and technical representation, that we can scarcely realize that we are in Manchester when we find ourselves in front of it. It is very simple in composition, in many respects very good, and in all very refined. The main entrance is on the ground floor, having but few external steps, and a tower, very ably designed, occupies, according to regulation orders, the centre of the Albert-street façade. Of this entrance and tower an enlarged drawing is given, detailing very exquisitely its ornamentation, and to which we would direct attention as an admirable specimen of purely architectural drawing of the French school. It is as exquisite in its way as Mr. Burges's notable drawing of one bay of the Law Courts, than which we cannot accord a higher praise. The angles of this design are rounded and crowned by small domed turrets, of poor and ineffective character, which, by the way, are horribly out of drawing in the perspective, and quite mar the general effect. The windows, also, of the main storey are much too large and crowded together to harmonize well with either those above or those below them, and the general effect is that of a large triangular sandwich. There is also a general absence of strong masses of light and shade, which makes the design at first sight appear common-place. We say at first sight, because, on closer examination, we find such care and grace in all the parts as would redeem it from ever sinking to an ordinary level. But it is chiefly in the plan that Mr. Salomons shines, and here we have evidences of very great ability. The noble range of reception-rooms and the great facilities of access to any part of the building mark this plan out as one of the highest merit, and a special or state corridor is provided in order that the business purposes of the building may not be interfered with by the more festive duties of the Corporation. Good access is obtained to the basement, and the conditions imposed upon competitors

have perhaps been more literally fulfilled by this plan than by any other. Mr. Salomons has been a martyr to the truth; he has spoiled his elevations by restricting himself to the line marked out as the limit of the buildings, and he has in some respects crowded his plan by providing the specific accommodation demanded on each floor, and the moral of all this is, that we should think Mr. Salomons will faithfully promise that he will never do it again.

Mr. Wyatt's design, too, is French in its character, but French of an earlier epoch than that of Mr. Salomons, going back to the style of the Consulate and the Empire. It is very ordinary, and possesses no great originality or merit. The entrance and centre are tolerably good, but the tower is very poor, and has no unity with the building over which it dominates. The only really good bit is the arrangement of the angle buildings. These are formed into quadrants of circles by projecting pavilions, which cut off the circular part from the front and side, and thus mask the awkward junction which would otherwise be caused by the acutely raking lines of the ground plan. These angle-buildings are terminated by domicular roofs, which, like the roofs of the pavilions in the centre of the lateral faces are high mansard-like coverings, ornamented with lead-work, whilst the main body of the design has no visible roof whatever—a solecism which is very marked and very inharmonious. The interior of the main hall is a very close copy of that of St. George's Hall at Liverpool; the other rooms are colonnades, filled in with windows on one side and doors on the other; and we do not think that we ever saw so much beautiful drawing expended on so little invention—there is scarcely one original idea throughout the whole. Mr. Wyatt must certainly have fallen off very much in this second competition, for we saw many better things amongst the rejected. His plan is fairly good, but is not of any eminent merit, and altogether we are disappointed with the fulfilment of the promise implied by Mr. Wyatt in his report, wherein he says he prefers to design his building in the Italian style, "because Manchester does not already possess any buildings of Classic treatment worthy the importance of that city." After looking at Mr. Wyatt's design we certainly find them better than could have been expected, many of them possessing that originality his is so sadly deficient in.

Of Mr. Brodrick's design we are very loth to speak; and the more so because he shows himself so very much moved by criticism. *Punch* stigmatises his perpetual columns as candles, and forthwith he forsakes his wonted chandlery and betakes himself to confectionery, in which art he sends us "the last sweet thing." There are some of the much-wrought stones of Venice, and the apse of a church turned into the entrance for a town-hall, and there is an enormous circular entrance which swallows up all the best room and does nothing else, and there is—a tower?—but we really can't go on. Mr. Brodrick gains his £300, and we think but little else. As for Mr. Lee, he takes in vain the name of a great good man and calls himself "Arnolfo di Lapo," though why, heaven and Mr. Lee only know. The sight of these two designs sets us thinking of those we saw in September last, and of how very many drawings there were in that "exhibition of the rejected," which far surpassed these last two or three now here. We only regret that the challenge we then threw down has not been taken up, and that the selected architects have not now exhibited their original designs; we should then have been able to see why some of them were selected (which at present we certainly do not), and we should then see more distinctly that which we can now but trace—how much has been abstracted from that *olla podrida* of all the other competitors, offered as a dainty dish to set before the lucky eight, and to watch the process of absorption, a process which we are now told is to be continued, for the council at their last meeting distinctly authorised Mr. Waterhouse to find that good in others his own design might lack, and incorporate, or rather conglomerate, it with the best parts of his own.

As for the action of the council themselves, we must certainly give them the credit for fairness throughout. Their first umpire took from them the onus of selecting twelve, which they reduced to eight competitors. Their second ones gave them an ingenious but not ingenuous report, by which one of the two favourites might be selected, and when this was wanted to be further strengthened and a triple shield erected, another report is sent, which is shrouded in impenetrable mystery. A silent awe comes o'er the lot, and from the mayor down to the bellman they are "dumb dogges all." What can this potent spell be? what this wondrous document? Does it, as is reported, find all the good in one design and all the ills in others? does it regard that as a merit for one which in all others it reprobates with horror? and does it claim as a structural truth in one that which in another is deceit? Of course, we cannot tell, but those who have seen and heard it say so, and we bow to their superior knowledge; but far rather would we see the council take the only step which honour leaves them. Let them even now publish fairly and openly the report, which they should never have stooped to receive secretly, and which we are, with sorrow and surprise, compelled to see that Messrs. Street and Donaldson have so far lowered their office and themselves as to make. An umpire should neither fear nor favour, and an award should at all times be open to both sides. Every principle of manly dealing is based on publicity, and that which is secret must, at least so long as it is secret, be wrong. It is our duty to urge that such wrongs be righted, and we never did that duty with more urgency than we now do in thus calling on the Town Council of Manchester to retrace their steps and prevent the initiation of so unfair a precedent.

CITY OF LONDON IMPROVEMENTS.

THE report, for 1867, of Mr. William Haywood, engineer and surveyor to the Commissioners of Sewers for the City of London, has just been published. Among other improvements, negotiations are in progress for setting back a portion of the western railing of St. Paul's Churchyard, and the frontages of Nos. 57 and 59, Ludgate-hill. The Post Office Department having compensated the various owners of property east of Bath-street, the Commission expect shortly to be able to complete the improvement in Newgate-street, between King Edward-street and St. Martin's-le-Grand. The church of St. Benét, Gracechurch-street, is at length being pulled down. During the present year, therefore, the Commission will be able to effect the long-contemplated improvement at that spot. The eastern and western ends of Fenchurch-street, and the eastern end of Lombard-street, are also to be widened during the present year. Referring to the cleansing of the streets Mr. Haywood states that the Commission, dissatisfied with the manner in which the former contractors performed the work, determined to undertake it themselves, and entrusted it to the Streets' Committee. They, accordingly, acquired upon lease an extensive wharf upon the Regent's Canal, near the City-road Basin, and also the use of a wharf on the Thames, adjacent to Whitefriars Dock. They entered into contracts for the supply of horses and implements, engaged a special superintendent and complete staff of foremen and sweepers, and have been since Michaelmas last employed in executing the work. Under the existing system, in addition to the usual daily cleansing, street orderlies are employed upon most of the main thoroughfares to collect the refuse as soon as deposited. This arrangement tends greatly to keep the streets clean during the busy part of the day and to prevent the accumulation of mud after rain. The Committee also offered premiums for the best plans for the speedy removal of heavy falls of snow from the streets, and a large number of plans were sent in in competition. The various suggestions they embody are still under consideration. Regarding the City Cemetery, at Ilford, the report states that it is yearly becoming more used by the citizens, and that a great number of bodies and human remains exhumed from City churches, for the formation of the Holborn Viaduct, the new street to the Mansion House, and other improvements, have been re-interred there during the past year.

THE EARTH SYSTEM.

To the Editor of the Building News.

Sir,—In your last number an article under this head appears, upon which I should like to offer a few remarks. There can be no more important question for public consideration than that involved in the present discussion, but I think there is some unfairness and not much ingenuity in the way the writer of the article has thrown certain allegations together, assuming them to be facts. The author seems to have hastened to conclusions upon very imperfect data. The question before us is, as I take it, this—What is the cheapest and least offensive method of removing from human habitations the waste and refuse matter, and what is the best way of preserving it for application to the land? How can we take it from the dwellings, where it is a nuisance, to the fields, where it becomes aliment for the soil? There is a very serious problem before us, and we shall have to go over much ground before we arrive at a satisfactory solution; but in travelling over it we must take care that we are correct as to our facts, and that we draw the right inferences from them. We have two methods, one that has been adopted for many years, and a new one that is pushed forward with much zeal, and supported by much inconclusive reasoning. The first method is that of making water the medium of conveying away to subterranean drains and sewers the foul matter of our sinks and water-closets. We must look at the advantages of what we will call the *water* system to distinguish it from the *earth* system. When properly constructed, everything committed to the water-closet or sink is at once conveyed away from the dwelling into the main sewer, and nothing left of an offensive kind. This is the method adopted and approved by all our leading engineers, and there need be no smell, no offence of any kind. The fæcal matter is at once removed from sight, and does not remain to offend any other sense. But your author says that "the water system is very far from perfect," and that "if it cures certain evils it creates others just as bad in their effects." Is it the system itself that is so imperfect, or does the imperfection arise from the bungling way in which it has been carried out in some instances? If we take the system I deny that the evidence of failure is "abundant and conclusive;" on the contrary, we have evidence of the most satisfactory kind to show that, when a system of drainage and sewerage has been scientifically carried out in a district, sickness has decreased and mortality has diminished. No doubt there are many instances where the system has been carried out in a bungling manner, from a penny wise and pound foolish policy on the part of its projectors, or from inexperienced men having carried out crude theories. The cases at Tottenham prove nothing. It has been said, but has never been proved, that the cases of fever arose from the irrigation of the fields with sewage water, and if it had been so proved it is not

much to the purpose, for the experiment of irrigating land in that neighbourhood has been carried out in the rudest way. Surely there must be some mistake as to the statement for which the Registrar-General is held responsible—that 78 per cent. of the deaths has been due to the use of water rendered impure from the presence of sewage water! I have not at this moment the means of referring to the Report of the Registrar-General, but must ask you to give us the means of verifying so extraordinary a statement.

I think some confusion has arisen in the mind of the writer of the article referred to, by mixing up two things which have no necessary connection, that of drainage and sewerage with plans of irrigation. Let us not make the former responsible for the errors in carrying out the latter; let us argue the subject philosophically, and then we shall see that much that is imported into it is entirely beside the question. It may be true that the irrigated meadow is not so healthy as ordinary pasture land, but I shall require much more than Dr. Macadam's assertion before I accept it, and everything depends upon the mode of application. But irrigation may be all wrong, and still it may be that the system of carrying the refuse matter through drains and sewers by the means of water, away from human habitations, may be all right. It is possible that one may be the worst and the other the best system that can be devised for the purposes intended.

Reference is made to the report of the Committee on the Metropolitan Sewage. There can be no doubt they were quite correct "that no efficient artificial method had been discovered to purify for drinking and culinary purposes, water which had once been infected by town sewage." But what of that? No one, to my knowledge, has ever proposed that the liquid matter running from our drains and sewers should be purified or deodorised and sent back to our towns as part of a water supply. The constant attention of our engineers has been directed to means of keeping away from rivers and streams the drainage of towns and villages, and to obtain water from other sources. Mr. Bazalgette has carried his main drainage so far down the Thames as to render it impossible that any portion of it can get back again to pollute that part of the river from which some of the London companies obtain their supply. Mr. Bateman went to Loch Katrine and not to the Clyde for his water for the City of Glasgow. What has this to do with the question? If the earth system were adopted, its stoutest advocate does not expect that all the refuse of the house is to be absorbed by earth. He proposes that all slops and all refuse usually sent down the sink—the water from the cook's kitchen, the fluids from the bed-rooms, &c., should still be conveyed into the drains. All he proposes to take up by the earth closet is that which is usually deposited in the water closet. It need scarcely be said that there is very much of the liquid refuse of a house that would become very offensive if kept, and that has a tendency to adhere to the internal surfaces of drains, so that the same kind of drain pipes and traps would have to be used, as a mass of corrupt matter has still to be carried away, and this it is proposed should be used for the purposes of "subsoil irrigation." We will, if you please, look at that hereafter; at present I will only glance at one or two other matters arising in the article before me.

Now, I hold that a perfect water-closet system is the best that has hitherto been devised for the purpose intended,—and that if of proper construction, and properly used, they might be put in a bed-room without any offence to the senses or any injury to health. I will hereafter point to a few essentials in construction. I must guard myself by saying that I do not speak of the wretched contrivances called water-closets, which are put up in thousands by speculating architects and builders, many of which are a disgrace to our age. But we are told that medical men assert, with regard to water-closets, that "since their introduction, owing to the lowering effects of the poisons emanating directly and indirectly from them,—the type of disease has been altered, and has become more dangerous." To what part of the world does this apply? Surely not to London, for since the water system has superseded the cesspools, the health of the London population has improved, and although some forms of disease have become more malignant, and those not such as are affected materially by malaria, many other forms are less malignant. Who are those medical men? Are they not putting down as a consequence, if it really be true, that which may be only a coincidence? At any rate, we have the opinion of medical men, who have the best opportunities of arriving at correct conclusions, that the converse is the truth. Before any of these statements can have the slightest value, we require to know who makes them, and on what they are founded.

There are grave objections to the earth system, especially in towns, and I speak from an experience of some fifteen years, having started so long ago with an ardent desire to make dry-closets succeed. I spent a great deal of time and money upon it. I will not trespass further upon your attention now, but ask permission in another letter to give my views upon earth-closets. I was a little amused to see in the article a reference to Deuteronomy. What next? I am accustomed to see Scripture quoted for every purpose, but scarcely expected to find it cited as an authority as to the kind of closets to be used. Perhaps nothing more was meant by the writer than to call attention to the law laid down for a primitive people. I would remind him that this instruction was given by the Jewish lawgiver as a matter of sanitary economy for a population dwelling in camps, and could have no reference to people living in cities. It enjoined as a matter of decency, that nature should be relieved away from the camp, and the deposits covered up.—I am, &c.,

B.

THE INSTITUTION OF CIVIL ENGINEERS.

ON April 7, a paper was read at the above Institution "On the Experimental Determination of the Strains on the Suspension Ties of a Bow string Girder," by Mr. W. Airy, Assoc. Inst. C.E. Although in this communication the case of a bow-string girder, as ordinarily constructed, only was considered, yet the author believed that the principle on which the strains had been ascertained was equally applicable to all mechanical structures with complex bracing, as, for instance, station roofs, where the labour and uncertainty of a theoretical calculation rendered an experimental investigation exceedingly desirable. The model on which the experiments were made was composed of a bow of steel, and had a span of 6ft. with a rise of one foot; the string being constructed of two slips of oak, and the suspension ties being of steel wire, gauge No. 6 (96ft. to the ounce).

The process by which the tensions were ascertained was the following:—The ties, on being sounded, gave a good resonant musical note, and advantage was taken of this to compare the note of any string with that of a free string suspended in a frame, and cut off by a sliding bridge to the length of the string under comparison. The free string supported a small scale-pan, and this scale-pan was loaded with weights till the note of the free string and that of the string under comparison exactly coincided. This was determined by ear with the greatest accuracy, the effect of ½oz. in 80oz. being clearly perceptible. The tension of the string on the girder was thus measured by the weight in the scale-pan of the free string; and this was done for every string in every case.

The determination of the thrusts was arrived at by a differential process, thus:—A uniformly distributed weight was applied on the girder, and the tension of every string was taken; then a travelling weight was introduced in addition, and hung at any one point, and the tension of every string was again taken, the difference of the tensions in the two cases of each string being regarded as the thrust, or tension, of that string produced by the travelling load.

The reduced results of the experiments, comprising the effect of every possible arrangement of loads that could come on a girder, were given in diagrams. It was verified by experiment: 1 deg., that the tension, or thrust, of every string was proportional to the weight causing it; and 2 deg. that when several weights were applied at the same time, the effect on every string was that due to the sum of the effects which would be produced by each of the weights separately.

The rules by which the strength of ties should be regulated, as deduced from the experiments, were, for an evenly distributed stationary load, that all the bars were in tension, that the end uprights were most strained and the middle ones least, and that, with respect to the diagonals, those were most strained which radiated outwards from the points where they met the string—the strain on each of which might be taken at one-half the load due to a bay—those that radiated inwards from the points where they met the string being strained to the extent of one-fourth the load due to a bay. In the case of a single movable load, the uprights were liable to a tension of from 10-34ths to 1-6th of the weight, as the load advanced from either end towards the middle, and the greatest tension to which the diagonals were liable was one-fourth, and the greatest thrust two-thirteenths of the weight.

SCHOOL OF ART.

Stoke and Fenton School of Art.—The competition drawings of the pupils of this school were exhibited in the Minton Memorial Building, Stoke, on Wednesday week, prior to their being sent to London for the annual competition. Mr. M. D. Hollins had offered £5 in prizes for modellings from nature and original designs, and there were three competitors, whose works were very creditable to them. The Rev. Sir L. T. Stamer, Bart., had also offered £5 in prizes for original designs for plates in earthenware, and there were two competitors. Besides the above, the works of the pupils comprised majolica painting, flower painting on porcelain, painting in monochrome in oil and in water colours, copies after Mulready's life studies, flower painting in water colours, figure light and shade studies from the cast, light and shade studies from flowers, light and shade studies from the cast in chalk and sepia, mechanical and architectural drawings.

BUILDING AND LAND SOCIETIES.

The annual soirée of the Dewsbury and West Riding Building Society was held last week at Dewsbury. At the meeting which followed, the Mayor, Mr. C. R. Scholes, presided. The secretary, Mr. W. Hemingway, read the report, which stated that the society was in a very prosperous position. The directors felt gratified with the steady increase of members and subscriptions. The number of members that had joined the society during the year was 79, and the number of shares 154. Deducting all withdrawals, the present number of shareholders was 200, the number of shares taken up £346 4s. 5d. The past year's subscriptions amounted to £2,220 7s. 6d., the deposits to £1,389. Owing to the bad state of trade the withdrawals had been very heavy. The amount withdrawn by subscribers was £825 14s. 4d., by depositors £465 17s. 6d., making a total of £1,291 11s. 10d. The amount on mortgage during the year was £2,534, making a total of £3,181, of which £192 had been paid off and realised. The profits of the society amounted to £33 2s. 10½d.

The estimates in 1866 and 1867 included votes amounting to £344,000 for the purchase of a site for additional offices in St. Martin's-le-Grand. The estimates now before the House of Commons propose a further vote of £20,000, part of an estimated cost of £150,000 for the erection of the proposed new offices. The estimates before the House propose votes of £6,000 towards £10,000 required for the erection of an embassy house at Therapia; £8,000 towards £20,000, the amount of the estimate for a new house for Her Majesty's Mission at Teheran; a second sum of £40,000 towards £179,382 for the consular buildings in China; and £15,000 for the consular buildings in Japan.

IRON WORK.

In scarcely any other department of art manufacture has the revival of art feeling been more apparent than in that of ornamental metal work. Twenty years ago we were content to take metal work by the weight, while the amount of original art feeling that pervaded it might be described as homœopathic. Now, the art of working ornamentally in metals seems living, healthy, and prosperous, and the vigour, simplicity, and beauty in the mass of contemporary work argues well for the thought and enthusiasm of the designers and the intelligence of the workers. Instead of the lumpish and spiritless cast work rejoicing in fat acanthus, or "Gothic" which attempted to imitate in iron all the details and feeling of stone, we have now work that recognizes suitability of design to material as its first principle, that aims at constructive correctness as its starting point, and which tries to find its variety in conventionalizing the diversity of nature; and I am inclined to think that the work of the present time will bear an honourable comparison with that of any previous era. Allowing that it does not possess the quaint energy of mediæval times, it does possess a refinement which is an honest characteristic of our own day, and which, as it is natural, is to my mind more desirable than any forced imitation of a feeling which was the natural concomitant of a ruder age. To Pugin and his coadjutor, John Hardman, belongs the merit of inducing this revival of true metallic art, and their efforts have been ably backed by our leading Gothic designers and metal workers, who have proved themselves workmen who need not be ashamed. Some of the works within the last ten years (the Hereford and Lichfield screens for instance) are triumphs of metallic art, and if there is a fault to be found with them, it is that they have too much delicacy in the detail, and a degree too little of that strength and muscle which should characterize a metal so essentially masculine as iron.

The examples of metal work which have been publicly exhibited since '62, although generally vigorous and common-sense in character, have not been important in size, nor strikingly original in idea. In Paris last year Mr. Skidmore, who in '62 appeared as the Magnus Apollo of metallic art, was but meagrely represented, the other chief exhibitors being Messrs. Barnard, Bishop, and Barnard, of Norwich, Hart and Son, and Cox and Son. The gates of Messrs. Barnard, and the principal work of Messrs. Hart, from the Paris Exhibition, are now in the Kensington Museum, and are both worthy of study. The first-mentioned is more mediæval in feeling than any modern work I have seen, but though possessing much of the merit of true mediæval work, it in a slight degree copies the blemishes, and though the whole effect is decidedly quaint, crisp, and spirited, the detail of the principal scroll work is a little thin and poor in design; the most perfect parts of the design, to my mind, are the side standards and the stages with the bas-reliefs, which have just enough relief and design to make them interesting without rendering them intrusive. The candelabrum, by Messrs. Hart, also exhibited at South Kensington, is boldly conceived and consistently worked out; the squareness of section in the framework and detail give it a strong masculine character, which is in good keeping with the general idea. The lower stage of the design is well filled up with judicious ornament, although the working out of the grotesque heads which terminate the triangular part show more of the praiseworthy effort than of the deed accomplished; the painted grotesques on the central column, however, are more successful, and are, indeed, all that could be desired. The whole work is more modern in feeling than the gates of Messrs. Barnard, and though less quaint is equally interesting.

Several of the catalogues published by the metal workers contain many valuable designs, and give evidence of careful study and antiquarian knowledge judiciously applied. The best I have seen are those by Hart and Son, Cox and Son, Peard and Jackson, and J. W. Dovey, of Manchester. Messrs. Hart's catalogue, though good, scarcely does justice to its authors, as much of their best work seems to have been omitted. Messrs. Cox and Son, who have executed several important works, have shown themselves desirous of keeping a foremost place, and have got up an improved edition of their catalogue, which contains many new designs of high artistic merit. The catalogue of Messrs. Peard and Jackson is well drawn and engraved, and the designs are, for the most part, judicious and workmanlike. Mr. Dovey's catalogue, though last, is certainly not the least in importance or merit. It contains several hundreds of designs, many of which have a "go" and suitability to material which I have rarely seen equalled.

The accompanying designs do not pretend to any strict mediæval feeling, but rather, believing in the catholic or cosmopolitan tendency of all true art, I have tried in some cases to cull a few of the beauties of Eastern art, which, I think, might fitly be engrafted with our own; and, as the intention of the sketches is that they should rather be suggestions than copies for imitation, variety in detail has been aimed at rather than coherency of design: and this explanation will account for the want of consistency in some of the designs, which would not have occurred had the sketches been intended as examples for actual work. J. Moyr Smith.

PLAIN OAK CABINET.

One of our lithographic sheets represents a cabinet—an oak cabinet—designed by Mr. Charles Bevan. The cabinet is made in wainscot oak, about 3ft. wide and 7ft. high. The lower part has four drawers, and is enclosed with two doors. There is also an enclosed part on the table shelf, fitted with trays or drawers. The shelves above are open to receive ornaments. The object of this design, says the author, is to show simplicity. Inlaying is omitted, and its ornament consists in the arrangements of the framing and moulding, one or two parts only being relieved by the carver. The designer says he has no intention of imitating any period, and has only aimed at a simple piece of furniture of sound construction.

WHITENED SEPULCHRES.

We are too well accustomed to associate in our mind diptheria, fever, and other contagious diseases with the filthy alleys and ill-drained houses inhabited by the poor. Facts, however, prove that in this respect the rich are by no means so secure as is commonly supposed. Dr. Whitmore, medical officer to the parish of St. Marylebone, in his monthly report for March just issued, says:—Deaths from diptheria and other contagious diseases, which occur not unfrequently in some of the best houses in the parish, have induced him to look a little below the surface in order to find, if possible, a cause for their existence in places so apparently protected by the best and most perfect measures of sanitary precaution, and he has discovered enough to satisfy him that many of the finest houses in our most aristocratic streets are but whitened sepulchres. "A few months since," says he, "a gentleman of position, occupying a handsome and luxuriantly furnished dwelling, complained to me of the ill-health of his wife and other members of his family, which he believed was occasioned by some hidden nuisance. Considerable time and trouble were expended in searching for the cause; at length two large cesspools were discovered in the basement of the adjoining house, from which an opening had been made by the rats into the basement of his own, and through which the poisonous gases from the cesspools found free vent. These cesspools were of course abolished, and as a necessary consequence the health of the family was restored. Within the past fortnight one of the sanitary inspectors has been engaged in a house to house inspection in a most respectable street, so respectable, indeed, that it seemed almost an insult to the occupants to investigate their sanitary condition, and yet, strange to say, in the rear of the houses in this street he discovered five cesspools, the existence of which had never been suspected. One of these cesspools I saw; it measured 18ft. in circumference, and in depth 12ft.; it was one-third filled with soil, which, when disturbed and exposed to the air, emitted the most horrible effluvia. With a knowledge of these facts we may cease to wonder that even in our most aristocratic mansions, fatal cases of fever and diptheria will sometimes occur."

PUBLIC WORKS AND BUILDINGS.

The House of Commons, in proceeding to consider the Civil Service estimates, will probably begin with the department of public works and buildings. The vote for the maintenance and repair of Royal Palaces, varying much of course from year to year, is high this session, amounting to £56,238, an increase of £14,293. There is no very great increase in the charges for palaces not in the occupation of Her Majesty, but there is an item this year of £8,000 for works for diverting the drainage of Windsor Castle from the Thames, and an item of £2,500 for contribution towards the removal of Old Windsor Lock, and the reconstruction of Romney Lock and Weir. The vote for Royal parks and pleasure gardens, £137,524, shows an increase of £12,198; there is a charge of £8,450 for reducing the depth and levelling the bed of the lake in Regent's Park. The vote for the buildings of the Houses of Parliament, £54,937, is slightly below the vote of last session. It includes charges for works in New Palace-yard and Parliament-square, and re-arrangement of the ground occupied by Mr. Canning's statue and the drinking fountain; another vote of £1,000 for Mr. Herbert's "Judgment of Daniel" for the Peers' Robing-room, £1,500 for Mr. Maclise on account of his wall-painting of the meeting of Wellington and Blucher for the Royal Gallery, and a re-vote of £400 for one statue in the chronological series of British Sovereigns in course of execution. The vote for the maintenance of public buildings shows a charge of £31,562, for rent of premises hired for the accommodation of public departments in consequence of the want of public buildings. A vote of £56,000 is proposed for Alderney harbour; up to the end of 1867 the expenditure had amounted to £1,226,861. For Holyhead harbour the vote is £29,429; the total estimate was £1,545,000. The vote proposed for the new Foreign Office is only £22,512 this year; the expenditure to the end of 1867 had reached £240,259. For the new Home and Colonial Offices the vote is to be £10,000; for the public offices' site, £42,760, the total estimate being £104,000. A vote of £24,000 is proposed towards a total of £61,000 for the erection and fitting up of the remaining portion of the east wing of the Public Record Repository. A further sum of £50,000 is required for the acquisition of land on the northern side of the National Gallery, nearly £69,000 having been expended, and £17,000 beyond the present vote will be required for completing the work. £10,000 is to be voted towards £25,000 for the repair and restoration of the Chapter-house at Westminster; £10,000 for the erection of a building to contain the natural history collections of the British Museum; £55,000 towards £160,000 for new buildings at Burlington House, for the occupation of the various learned bodies; £20,000 for a grant in aid of new buildings for the University of Glasgow—a new vote, in part of £120,000 to be spread over six years. The vote for public buildings in Ireland is £149,259, an increase of £32,962. The whole result is that the votes proposed for public works and buildings amount to £1,266,782 an increase of £198,000 over the vote of last session.

The Marquis of Salisbury, who died on Sunday was not only a large landowner, but a great patron of agricultural improvement. His establishment at Hatfield is particularly worthy of notice. Exclusive of agricultural machinery, there are considerable works: brick and tile works for drainage and ornamental pottery for the mansion and houses, drawing office, with clerk of the works, survey office, turbine mill under an engineer, joinery-shop, with planing, sash-making, and other machines moved by water power. The same turbines supply Hatfield House and town with water. The Marquis took a deep personal interest in these affairs, and so far was a considerable manufacturer, and an intelligent employer of capital.

PLAIN OAK CABINET DESIGNED BY C BEVAN

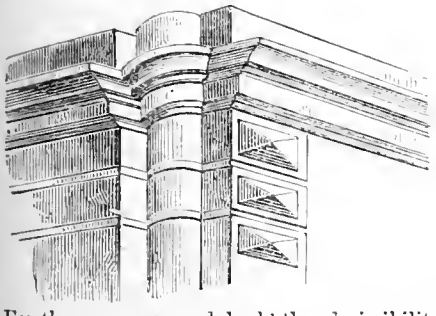
CONSTRUCTIVE AND ÆSTHETIC DESIGN.—NO. XIV.

WE have already spoken of angle pillars or shafts, their too frequent and affected appearance when only employed for ornament, and their legitimate use in relieving the angles of door and window openings. As a rule, such features become meaningless when they depart from their avowed object by assuming functions they do not really possess, as in

FIG. 1.

angles of buildings and chimneystacks, where the idea of their supporting is conveyed by the use of caps, and where the idea is utterly puerile and absurd. In chimney-pieces and decorative details they are admissible as ornamental accessories, but not so when employed in structural situations, where strength and reality of purpose is or should be apparent.

FIG. 2



For the same reason, I doubt the admissibility of crockets and bosses at the corners of buttresses and other exposed positions, where a plain angle or chamfer is far preferable. Some architects are too fond of indulging in an ex-

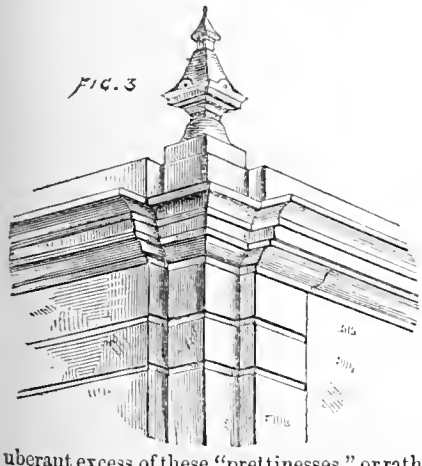


FIG. 3

uberant excess of these "prettinesses," or rather excrescences, wherever they have an angle or chamfered corner, forgetting that in the best periods of Pointed or Mediæval art such effer-

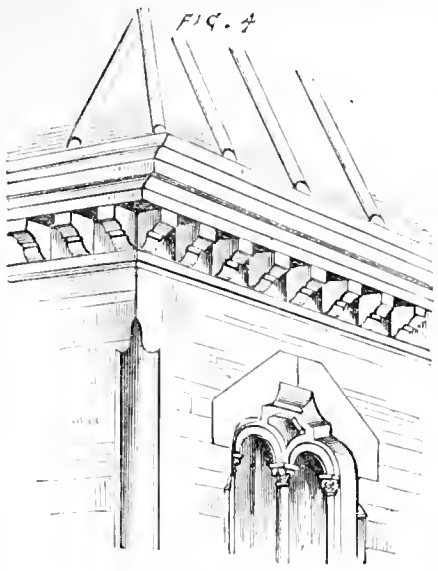

FIG. 4

vescences of the sculptor's art were confined to the interior parts, and to the minor accessories only, as to flying buttresses, pinnacles, spires, the copings of gables, &c., seldom interfering with the structural simplicity and breadth of the edifice, as we find in later examples of the style. The due subordination

FIG. 5.

of sculpture and painting to architecture is a lesson the architectural ornamentalist or milliner no less than the tyro has yet to learn, for we are continually witnessing the pictorial usurping the "architecturesque;" nor can we

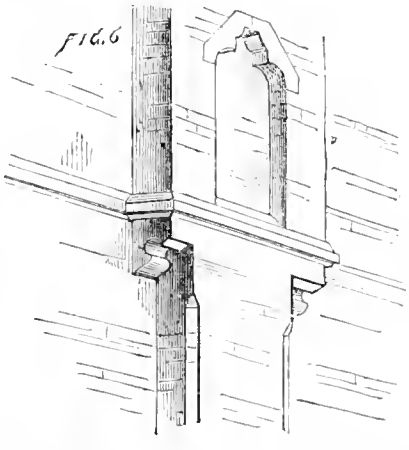

FIG. 6

wonder at it when we find in the progress of art as in religion and science, the objective always taking precedence of the subjective, the literal transcript that of the conventional. The proper sphere of each in the great system or hierarchy of art is only to be found and understood by a wider and more comprehensive study of the fine arts than the modern "pick-up" teaching of our profession inculcates; and generalisation is the crucible through which our fragmentary elements should pass.

As illustrations of the modes by which structural simplicity can be combined with effect both in brick and stone work, we engrave instances of a few important features; and it may be observed that the old Scotch baronial style affords a rich field for the architect in this branch of design. G. H. G.

GROUP OF SOLID OAK FURNITURE.

OUR illustrations of furniture last week were from a group designed by Mr. J. H. Banks, of the firm of Sidebotham, Banks, and Co., church and school furnishers, Manchester, and was executed by them for H. Stubbs, Esq., Woodheys, Ashton-under-Lyne. The cost of the cabinet was fifty guineas, the table eight guineas, and the chairs four guineas each. Messrs. Sidebotham and Banks have bestowed special attention, and with much success, on the production of superior furniture.

WATER SUPPLY AND SANITARY MATTERS.

Sir George Denison, brother of the Speaker of the House of Commons, is to be the Chief Commissioner of the new commission on the pollution of rivers.

In a letter which has been published, Mr. Robert G. Sillar, of 62, Cornhill, says:—With respect to the great sanitary problem of the disposal of the sewage of towns it may be interesting to know that the solid matter can be precipitated from sewage in a few minutes by pouring in a solution of common alum. The muddy waters of the Woosung River in China are always purified in this way for household use, and the same process might advantageously be applied to the sewage of any town, allowing the liquid portion to pass into the river, and the solid to be available for manure.

Building Intelligence.

CHURCHES AND CHAPELS.

The foundation stone of a new Wesleyan Chapel was laid on Good Friday at Wall, North Tyne. The building, which, although small, will not be devoid of architectural merit, will seat 140 persons.

The restoration of the nave of Bristol Cathedral is steadily progressing. The portion abutting on the tower is several feet above the ground, and in the cloister yard the foundations are solidly laid. The new cloister door, designed by Mr. Street, is fast approaching completion, and will be used for the first time to-day, on the occasion of laying the corner stone, for which purpose the Earl of Limerick, as Provincial Grand Master of Freemasonry, is expected from Cannes.

The chancel of St. Peter's Church, Wymondham, having been thoroughly restored, under the direction of Messrs. Goddard and Son, architects, of Leicester, will be re-opened to-day. During the progress of the work an ancient hagioscope was discovered roughly walled up and hidden by plaster. It formerly permitted a view of the high altar from the south transept. Another ancient feature of the church, its sacristy, which had been entirely removed, was lately rebuilt on the original foundation, so that the chancel with its appurtenances may now be said to be again complete.

Considerable improvements are being made in St. Hilda's Church, South Shields. Last week Mr. Wailes, of Newcastle, successfully placed a new stained glass window in the chancel. The window represents the Crucifixion, the cross occupying the upper portion, while the lower is filled by the figures of the Virgin, St. John, and the Roman soldiers casting lots for the Saviour's raiment. The other decorations and alterations in the chancel are being executed by Mr. George Cooper, of Newcastle, and will be completed this week. Mr. T. W. Rowe, sculptor, South Shields, is engaged upon an altar-piece representing the Last Supper, which is to form part of the new decorations.

From an extremely interesting account of Shanghai, which appears in the *Scotsman*, we learn that the church in course of erection there, from the designs of Mr. Gilbert Scott, is far advanced. Although only intended to hold about 800 persons, this church is to cost £25,000. In speaking of the architecture generally of this wonderful city, the writer remarks that some of the public buildings, as the English Club and the Masonic Hall, would not be out of place in London. The French settlement has an imposing townhall, and some other fine buildings, as also a magnificent boulevard. The Jesuit cathedral is a building of some pretensions, and is prettily decorated. The walls are painted with the usual scriptural pictures, with this difference, that the principal persons portrayed figure in Chinese costume. Thus, for instance, the women watching at the tomb are represented as fair damsels with their hair combed back and their feet encased in the smallest of shoes. The walls and windows are covered with sentences in gilt Chinese characters. The chief curiosity, however, is an organ, constructed entirely of bamboos, being the handiwork of one of the priests.

A parish church for Ruswarp, a suburb of Whitby, containing 308 sittings, is about to be erected from designs prepared by Mr. Charles Noel Armfield, architect, of Whitby. The plan comprises nave, with south-west porch, two bays of a south aisle, semi-circular apsidal chancel, and vestry under tower, which latter is on the south side, at the junction of nave and chancel. With the exception of the dressings to arches, windows, doors, &c., the whole of the walls will be plastered on the inside with "Martin's fireproof cement," to which it is proposed to apply a considerable amount of coloured decoration. The walls, which are to be built of brown Busca Gill wall stones, hammer dressed, and fine white sandstone from Blue Bank, random tooled, for the dressings, will be 2ft. 3in. thick, 22ft. 6in. high above floor of nave, having buttresses 2ft. square at intervals of 12ft., centre and centre. The tower rises to a height of 64ft., which raises the belfry well above the roof ridges. A spire 46ft. high finishes the tower, making a total height of 110ft. The whole of the works, except decorative painting, have been let to Mr. Robinson, builder, of Whitby, for £1,816 16s. The architect's estimate was £1,871.

On Thursday week the new church of St. John-the-Divine, Brooklands, near Manchester, was consecrated by the Lord Bishop of Chester. The style is Gothic of a simple type, belonging to the earlier period of French work rather than to that of England. The materials of which it is built are Yorkshire shoddies of a warm tint, with dressings of Halifax stone, the walls being lined internally with fire-bricks, cream and brown, in bands and diaper work. The plan is a nave of six bays, 90ft. long by 33ft. wide, without clerestory, roofed in one span, having transepts north and south, taking up the two easternmost bays, divided from the nave by arcades of two arches. The extreme width across the transepts is 68ft. Beneath the eastern rose window is a reredos painted in wax colour, covering a space of 13ft. wide by 5ft. 6in. high; it is divided into three compartments, the central subject being our Lord in glory, with, on either hand, angels in postures of adoration, and at the four corners of the central panel are cherubs apparently full of song; the background of the work is filled in with plants of wheat and vine, conventionally treated. Above the reredos, in the spandrels below the rose window, are two medallions, filled with Caen stone, heads of the Blessed Virgin and St. John, with gilded aureoles. The building is arranged to accommodate at least 500 worshippers, and a large proportion of the seats are free. The general contract for the work has been carried out by Mr. Joseph Robinson, jun., of Hyde, from the designs and under the superintendence of Mr. Alfred Waterhouse, architect, of London and Manchester.

On Good Friday a new Wesleyan Chapel was opened at Hockby Hill, near Birmingham. It is a plain building in the Gothic style, and will cost about £1,000. Messrs. Lewis and Davis, of Birmingham, are the builders.

A church is about to be erected in the St. John-street-road, for the new district of St. Peter, in the parish of St. James, Clerkenwell (to take 8,000 of its population of 25,000), upon the site secured as the nearest available to the scene of the Smithfield martyrdoms. The cost of the Martyrs' Memorial Church, including schools and parsonage, will be about £10,000.

A new Baptist Chapel was opened last week at Kidderminster. The style is Gothic. The walls are of pressed red bricks, relieved with facings of white Bath stone. The area of the building is 72ft. by 40ft., and it will seat about 600 worshippers. The baptistry is lined with encaustic tiles. The total cost will be about £2,400. The work has been executed by Messrs. Scholes and Warrington, from the designs of Mr. G. Bidlake, architect, of Wolverhampton.

On Monday afternoon the foundation stone of a new Wesleyan Chapel was laid at Gosforth, near Newcastle-on-Tyne. The style is Gothic, and the building will be all of stone. Its length will be 51ft., and the width 27ft., and it will seat over 200. Mr. F. R. N. Haswell, of North Shields, is the architect, and Mr. Nesbett and Mr. Robson, of Bulman's Village, are the contractors for the masons' and joiners' work.

On Tuesday afternoon the foundation stone of a new Baptist Chapel was laid at Rodley, Yorks. The building will be in the Italian style. The inside measurement will be 90ft. by 54ft., and 40ft. from the floor to the crown of the segmental ceiling. The walls will be built of Horsforth stone, lined inside with brick. The edifice will seat 1,100 persons, and the total cost will be £3,500. Mr. John Simpson, of Leeds, is the architect.

On Easter Monday, the ceremony of laying the memorial stone of a new district church in course of erection at Shildon, was performed by the rector. It is to be called the "Church of All Saints," and will be built in the Early English style of architecture, to seat 300. The work is being carried out by Mr. Borrowdale, builder, of Darlington, from the designs and under the superintendence of Mr. Pritchard, architect, of the same place.

The foundation stone of a new church, to be dedicated to the Saviour, was laid on Easter Monday, at Everton, near Liverpool. The style is thirteenth century Gothic, and the building will consist of a nave with two aisles, and a chancel with chantries on each side. The length is about 109ft, and the height to the ridge of the roof about 70ft. The walls are of native red sandstone, the pillars supporting the nave of Cefn stone, red Mansfield being used for the smaller shafts. The church will seat 900 persons, and will cost over £4,000. Mr. Gordon M. Hiles is the architect, and Mr. Tomkinson, of Liverpool, the contractor.

The annual meeting of the Chester Diocesan Open Church Association was held on Thursday week. The honorary secretary read the report, which stated that in the previous report they had called attention to the fact that three Liverpool gentlemen had, at their own cost, built, and to a certain extent endowed, three churches, in neighbourhoods where they had long been much required. This year would, it was hoped, witness the completion of four other churches devoted to divine worship in the same noble and generous spirit. Mr. C. H. Horsfall, with the assistance of a grant of £2,500 from the Liverpool Church and School Extension Society, proposed to build a church at a cost of £7,000, for a district in Toxteth Park. His brother, Mr. Robert Horsfall, assisted in the same manner, had secured a site and commenced the erection of a large and handsome church in the Prince's Park-road; the architect is Mr. G. E. Street. The Rev. J. C. Reid and Mrs. Reid were at their sole cost bringing to a speedy completion a very beautiful church in the parish of West Derby; and Mr. William Preston was about to commence the erection of a church on his own estate on the borders of the same parish. A fifth church would soon be provided for another district by a munificent bequest of £10,000. To this list might be added the intention of the Earl of Sefton to build a new church for the chapelry of Kirkby. During the past year various grants had been made by the committee. The usual resolutions were adopted.

BUILDINGS.

The memorial stone of the Walsall Cottage Hospital was laid on Monday last, by the Countess of Bradford. The general external appearance of the building is not pleasing, the architect having evidently had to study utility, convenience, and strict economy. The ventilation and warming arrangements for the two new wards are very satisfactory. The buildings have been carried out from the designs of Mr. G. B. Nichols, architect, of West Bromwich, by Mr. Adkins, builder, of Walsall.

The Paris correspondent of the *Star* says that Baron Haussmann's "building mania" extends to the provinces. Pickaxes and hammers have lately disturbed the echoes of a lovely little valley once dear to the Druids, of whose mysteries its seclusion and ancient woods are eminently suggestive, the result being a temple and statue erected at the sources of the Seine, the chief object thereof, the writer thinks, being the opportunity the said monument affords for an inscription in which the name of M. le Baron Haussemann, Senateur, &c., appears indelibly inscribed on the marble. The Emperor plays a very secondary part in the affair.

New York City is to have a new Post Office. The building will be of white marble, and will cover 2½ acres of ground. In shape the Post Office will be triangular, and will cost not less than 3,500,000 dollars.

The rebuilding of the Medical Hospital of the Royal Infirmary of Edinburgh will be one of the most important works undertaken there for many years. The estimated cost is £100,000.

The dining-room at the side of the refreshment hall, South Kensington Museum, is being decorated by Morris and Company, and is now nearly complete; the panelling, walls, and ceiling have received coloured decoration, stained glass has been inserted in the windows. The room on the other side, entrusted to Mr. Poynter, will shortly be proceeded with.

Workmen are now engaged in making the true levels in the carriage and footways from the top of Fetter-lane to Hatton Garden on the opposite side, so as to meet the newly-formed street from the top of Holborn-hill to Farringdon-road. The new iron viaduct over Shoe-lane has been finished within the last few days, and furnishes a neat specimen of girder bridge building on the buckle-plate system. The whole of the upper surface of the arches over the subways, &c., of the raised way are now in course of being asphalted, prior to the distribution of the broken granite intended as the bed of the new permanent roadway.

Last week the foundation stone of the new National and Sunday Schools to be built in Zetland-street, in connection with the Wakefield parish church, was laid by the Lord Bishop of the diocese. The buildings, which are to be of Gothic design, and are intended to afford accommodation for 500 children, consist of boys' school room, 60ft. by 20ft.; girls' room, 66ft. by 20ft.; infants' room, 52ft. by 21ft.; and two class rooms, each 16ft. by 16ft. The external faces of the walls will be of pitched faced stone from quarries in the neighbourhood, with tooled dressings. The cost of the buildings will be about £1,800. Mr. William Watson, architect.

The proprietor of the *Philadelphia Public Ledger* has erected new premises for that journal. The building contains 64,812 square feet of space, and is lighted by 354 windows. To pass round all the above-ground apartments constitutes a journey of 1,798 yards, or rather more than a mile.

The works for the great dockyard extension at St. Mary's Island, Chatham, have been making good progress during the fine weather which has prevailed. The workmen are actively engaged in constructing the three basins; the brickwork of the third or north basin was recently commenced. The steam brick-making machinery, upon which a large number of convicts are engaged, is in full activity, and it is expected that during this year some twenty million bricks will be made. A large party of convicts are now employed in making a new roadway to the extension works.

New schools in connection with Zion (Congregational) Chapel, Wakefield, are now in course of erection, and on Tuesday the memorial stone was laid. The building will be in the Italian style, and is to cost £2,700.

A volume containing a collection of ancient engravings, of which a large number were by Albert Durer, was recently stolen from the library of the University of Bologna. Those works of art were so rare as to be valued at 70,000f. A small number have just been discovered and seized at Stuttgardt, but the greater part have been so dispersed that their recovery is almost hopeless. Among the number were several prints presented by Pope Benedict XIV., but one of the thieves, who have all been arrested, declared that he had burned them, because they bore a stamp by which they would have been easily identified.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—R. H. I.—S. W., jun.—C. F.—I. C.—I. B. —S. B. and Co.—A. T.—J. S.—A. T.—T. M. S.—G. T. R.— I. P. S.—E. W. P.—A. M.—A. J. M.—B. and M.—H. H. S. —W. B.—A. M. (with MS.)—I. H.—S. B. and Co.—H. C. W. Y.—See BUILDING NEWS for August 16, 1867. A. G. O.—5s.

ERRATA.—ORGANS.—SIR,—Will you kindly correct the two following errors of printing in my last. At page 249, line twenty-one from bottom, for two fifths read three-fifths. This is manifest from the context, but still as it is a matter of some consequence it should be corrected. 2. Second line from the bottom, for "apparatus" read "apertures."— J. C. J.

Correspondence.

COULEUR DE ROSE.

To the Editor of the BUILDING NEWS.

SIR,—A curious contrast is presented by the criticisms in the BUILDING NEWS and *Builder* of this week on the designs for the Manchester Townhall—so curious that those desirous to learn the real state of the case, and who cannot pay a personal visit to Manchester, must be fairly puzzled. Your contemporary, if not of the ostrich nature, too confident of safety with its head in the mud to prevent sight of danger, is, one must allow, by far the pleasanter guide to follow. According to its judgment "the beneficial effect of such an exhibition on the public mind must be considerable." "To the student in architecture a lesson is provided, set forth in its most attractive form." Then "the City Council have shown every desire to free themselves from the trammels of favouritism and 'jobbery,' and this, I think, most will concede at once, however their good intentions may have been frustrated by the evils inherent in the wretched system of competition." And, finally, "the result of this competition must be highly gratifying to the citizens, proving, as it does, that one of their number is able to cope successfully with the best men of the profession. The writer has seen all the drawings, and can confidently say that either for architectural excellence, skill in planning, or artistic and delineative execution displayed in the drawings, no finer collection (not even excepting that for the London 'Law Courts') has ever resulted from one single competition." There is a delightful subject for contemplation. No need to ask the price of a return ticket to Manchester. Without counting the cost, all the profession must go by next train, rejoicing in having lived in a century so prolific of genius. But it is as well, before starting, to see what the BUILDING NEWS says, lest there may have been a slight *couleur de rose* in the glass through which the above view was taken:—"The Commination Service seems to have prolonged itself from the first day of Lent to this, very near the last of it, for the—well—not blessings we hear, are, if not loud, most certainly deep. We wonder if ever there were, or could be, a satisfactory architectural competition."

Stay!—Was this a glass blacked to look at an eclipse through? Let us rub our eyes again and hesitate before incurring so reckless an expenditure as we had contemplated. The BUILDING NEWS gives a detailed criticism of only one—the successful design; while the *Builder* expatiates upon the whole eight "beatitudes," indeed, as it describes them, almost *all* of whom, according to its judgment, are most *honourable men*, whom the profession must forthwith delight to honour.

Points of comparison between the critiques on the individual designs are wanting, except in the case of the successful competitor; so, on the whole, I propose to postpone my contemplated journey till after the Easter holidays, and a careful perusal has satisfied me as to how much is due, in one case, to *couleur de rose*, and in the other, to a colouring of a more sombre character. Oh! that one might hope—but I fear it is too much to hope—that truth may be found clad in the above roseate hues. Will the forthcoming exhibitions resolve the doubts of

A NON-COMPETITOR?

ORGANS.

SIR,—I must request your readers to turn to page 71 of "Hopkins on the Organ." Hopkins is one of "J. C. J.'s" authorities. He distinctly says that the quantity of tin in pipe metal does affect the tone. Is it likely that a genius in his art like Father Smith used 3-4ths tin for any other purpose than sound? I would call attention to Mr. Hopkins's statement about the metal of the pipes at the Temple and St. Paul's, and at the Minoseten Church, Bonn.—I am, &c.,

W. TAYLOR.

SIR,—I have read with much interest the various letters upon organ building that have appeared in your journal, and I think it quite time the public should be made aware of the shocking rubbish now placed in some of our churches, doing far more to irritate than soothe the minds of priest and congregation. The very idea of comparing such a builder as Willis with Schulze and Cavaillé Coll is simply absurd in the extreme. I can easily understand anyone, whose ears will allow them to admire the tone of Willis, being utterly unconscious of any difference in the sound from a pipe of good or bad metal, but more acute ears distinguish in the purer metal a fine singing tone, in the baser compound a dull and heavy tone. Being well acquainted with the instruments of Schulze, Cavaillé, and Willis, I will make some few remarks on the characteristics of each.

First, Schulze, for firm tone, grand mellow diapasons, of about six times the power of those usually found in English organs, fine salicionals, and many other stops of the kind, delicate and beautiful stopped diapasons, differently scaled, and called by various names; open flutes of broad tone. He also makes a very fine Flauto traverso (a wooden harmonic flute peculiar to Germany); the whole of his mixture work has immense power and brilliancy, quite incomparable with anything of the kind.

Schulze's reeds are his weak point—not that they are bad; on the contrary, they are the finest I have heard of the close tight tone, which tone is unfortunately adopted by nearly all the English builders, perhaps to the greatest extent by Willis, the chief difference being that Schulze's are extremely equal throughout the scale; those by Willis are extremely unequal.

The organs of Cavaillé are remarkable for fine workmanship, steady, and firm tone, immense power, and great brilliancy of reed work, fine harmonic flutes, and light stops of great refinement. His general flue work is light and ineffective. If Cavaillé had not done more than his arrangements of wind for the steadying of tone he would be entitled to a very high rank among the organ builders of Europe.

Willis is known chiefly by his rough and ready system of workmanship, small and unsteady bellows, the pump handle having to be worked as vigorously as possible, communicating its vibrations to the whole organ tone. This alone would make Mr. Willis a second-rate organ builder, if he succeeded in all other respects. His diapasons are of a wishy-washy tone, fluty in character, and entirely devoid of the proper harmonics, such as characterise Schulze's diapasons, Erard's grand pianofortes, and all other tone of a good and refined quality. The mixture work by Willis is small, miserable, and screamy, combining in no bearable manner with the rest of his work. His sole point of power is usually gained by tight unpleasant toned reeds upon some great pressure.

It has been said that the pipes in Father Smith's organ in St. Paul's are of common metal. It has also been said, by your same correspondent, that metal composed of half tin or less, in combination with lead only, makes a soft compound that will do its work but for a short time. If this is the case I would ask how it is that the pipes in St. Paul's organ have performed their duty so well for 200 years, if composed of so small a quantity of tin with lead—type was certainly not used in those days. I think I could point to many failures in type metal of less than twenty years' standing. My own opinion of the St. Paul's pipes is that they are of fine metal, and I have often had the handling of them. I will not say that they are for a certainty, nor am I disposed to accept the authority of the very eminent organ builder who has had so little experience in good metal. With regard to the other builder, Lewis, I know but little of his organs beyond the one played upon in his factory at Brixton some few weeks since. It certainly appeared to be a most extraordinary instrument for its size, and very beautifully finished. I am told by many eminent musicians that he will eventually take the lead, at any rate in this country.—I am, &c.,

R. T.

MANCHESTER TOWNHALL.

SIR,—One sentence in your last week's article runs thus:—"To obtain all this Mr. Waterhouse has encroached somewhat on the space allowed for the buildings [areas?], and thus obtains one advantage over those who have complied with the conditions."

As an answer to this, may I be allowed to quote two sentences from the conditions, which seemed to me to give quite as much latitude as I found it desirable to take?

"Architects are to use their own discretion as to the shape and form of the building, and are not obliged to adhere to the boundary line of the land as shown on the plan."

"The lengths of the various projecting portions and areas in Princess-street and Lloyd-street may be altered to suit the design of the competitor."—I am, &c., ALFRED WATERHOUSE.

8, New Cavendish street, Portland-place, W., April 15.

PUGIN *v.* BARRY.

SIR,—I beg to enclose you a copy of a note from Mr. E. M. Barry, together with my reply to it, which must, so far as I am concerned, close this controversy for the present. You will see that my original statement is completely confirmed by the evidence of Mr. Wolfe, as given in Dr. Barry's pamphlet. To vindicate my accuracy in that statement is all that I am now disposed to do. As regards the particular drawing (which in contradistinction to the *design* the Messrs. Barry make so prominent), I do not care to prove who was the draughtsman—whether it was inked in by Sir Charles Barry over Pugin's pencilling, or traced, copied, or in any manner reproduced from Pugin's design; or, on either supposition, whose was the hand that inserted the initials A. W. P., whether they were unthinkingly traced, and by whom; whether Pugin himself inserted them afterwards, to mark the authorship of the design? The initials stand there, however, and every theory of the Messrs. Barry to account for their presence has been hitherto wholly inadmissible.—I am, &c., J. R. HERBERT, R.A.

7, Grove End-place, St. John's Wood-road, April 15.

MY DEAR MR. HERBERT,—Your letter has only just reached me, bearing yesterday's post mark, though dated the 28th inst. It does not answer the request made in my letter to you, but raises instead points of controversy which it will do no good to enter upon.

The *sole question* on which I addressed you was the authorship of the drawing of the throne. I say it is wholly my father's. You have said publicly that you saw Mr. Pugin make it. I have asked you to describe it, as it is very peculiar, and the photograph gives only a part of it, and I have requested you to come and see it. To neither of these requests have you yet replied.

Mr. Powell stated to me exactly what I told you, and has since written to me that he has informed Mr. E. Pugin that, though "very Puginesque in character, it is Sir Charles' own drawing." Whether it is or is not "Puginesque" in character, may be a matter of opinion, but whether it is the drawing of Mr. Pugin or Sir Charles Barry is not a matter of opinion, but of fact; and this I ask you to come and judge for yourself, feeling sure that, professing as you do truth to all other considerations, you will not hesitate to repair any wrong you may be convinced you have done me.

As to any explanation of the initials, that is altogether a secondary question; for if Sir Charles Barry made the drawing, it would be absurd to suppose he would have put Mr. Pugin's initials *as such* upon it.

I will add, in conclusion, that you cannot point to any word of mine which reduces Mr. Pugin to the level of little more than a clerk. I have always admired and fully admitted his rare genius, and the great value of his aid at Westminster. My father, I know, invariably did the same, and spoke of him in the warmest terms. This controversy has been none of my seeking, and I cannot be responsible for its results.—Yours faithfully,

J. R. Herbert, Esq., R.A. ED. M. BARRY.

21, Abingdon-street, Westminster.

MY DEAR MR. BARRY,—The first thing I do after despatching my picture to the Royal Academy is to reply to your letter of the 31st ult.

I must premise that my note to Mr. Edward Pugin of February 24 was hastily written, without any idea of publication, and it was in that note that I said Dr. Barry's photograph was taken from the "actual drawing." All that I then meant was that it was a representation of the actual *design*, as I took the earliest opportunity of explaining in my letter to the *Standard* of February 29, adding

that "I could not of course tell whether the photograph in Dr Barry's pamphlet was taken from the original drawing, or from a very careful reproduction."

Now I have to complain that from that day onward this explanation of mine has been persistently ignored, and my words given above have been more than once garbled, to the perversion of their meaning. Your brothers Charles and Alfred have each quoted part of the above sentence, stopping short in the middle, and placing a full stop where I (with a certain caution) had not used even a comma: that is, they each of them omitted the all important words "or a careful reproduction;" thus leading the public to suppose that I have spoken of one original drawing only.

The repeated challenges therefore from you and your brothers to describe the particular drawing from which the photograph is taken, are wholly beside the mark, and, if I may say so, are not very ingenuous.

But you may say that, in my letter calling attention to the existence of the initials "A. W. P.," I meant to say, it was the actual drawing which I saw Mr Pugin making. The existence of the initials certainly favours the view that the drawing is by Pugin himself, but it does not induce me to change my supposition that it might be a reproduction from a tracing, wholly or in part. If the drawing should be from the *hand* of Sir Charles Barry, it is for you, and not for me, to explain the presence of those letters in the place where they are. Only I must beg leave wholly to reject the explanation hazarded by you and your brothers, that the initials of the Prince of Wales could possibly have been placed by Sir Charles Barry, or any other same man, on the canopy of the Queen's own throne.

Passing now from this entirely secondary question, I return to my original statement, which, deny it or evade it, as your friends may, bears most importantly upon the real question at issue in this matter.

Allow me to remind you that beneath the photograph in Dr Barry's pamphlet is a note I presume by him—in these words:—"It" (*i.e.*, the photograph) "suffices to show how completely Sir Charles Barry's designs prescribed the limits within which Mr. Pugin's assistance was rendered, even as regards the special works of detail entrusted to him."

Now, what did I say? I said that I sat working by the side of A. W. Pugin when the post brought a packet from the then Mr. Barry, containing a drawing, made by Mr. Pugin, of a pointed canopy, for the throne in the House of Lords treated as a shrine, and that in the packet was a small sketch treating the canopy as a baldaquin, square headed, and in very few lines, barely enough to indicate what was meant. Now, what says Mr. Wolfe?—page 67 of Dr. Barry's pamphlet: "The throne was originally designed with a spire-like canopy of tabernacle work, but fearing it would interfere with the frescoes to be placed above, Barry requested Pugin to draw out a throne in harmony with the general style of fittings he had determined to adopt." Here we find Pugin employed not merely to fill in ornaments, as Dr. Barry's note would lead the public to infer, but making a design for the throne from the very beginning, which design, had it not been from its interference with the frescoes above, would have been adopted by Barry as the ostensible architect of the Houses of Parliament. But this object interposing, Mr Barry requests Mr. Pugin to draw out a new design from the beginning, merely giving him the few slight scratches which I saw arrive to Pugin's hands, as described by me in my letters of February 24 and 29 last. In consequence of this Pugin commenced the drawing which I saw, and which Mr Wolfe says he well remembers, and which had, in his opinion, "much the appearance of a heavy half-tester bedstead." Thus Mr. Wolfe completely confirms my original statement. But Mr. Wolfe affirms that Barry so altered the design "that when it was returned to Pugin to prepare the working drawings, little more remained of the original design than the *general form*." I do not accept this statement as it stands, but admitting its correctness for the sake of argument, we have it thus confessed that the general form of the present throne was Pugin's. And it is not only admitted but asserted by you and your friends, that Pugin was employed to fill in the details, and the facts being so, that the general form was Pugin's, the working drawings Pugin's, and the details Pugin's, I am quite content, so far as my testimony is concerned, that Sir Charles Barry shall have the credit of whatever may remain.

You will remember that I said in my letter of February 29 "that I do not affirm that no detail was afterwards changed," for no one would dream of denying that your father's suggestions might have been of great value even to Pugin. I must ask you to forgive me if I express my conviction that what happened in this matter of the throne—which you have selected as a crucial instance in your father's favour—happened also throughout Pugin's connection with the building. I say, therefore, once more that A. W. Pugin is entitled at least to the honour of being the joint architect of the Houses of Parliament, and nothing would more truly rejoice my heart than on this basis to see you shake hands with the son of your father's friend. The time will come when you will look back on this controversy with a more impartial eye, and will admit that Edward Pugin had more justice on his side than you now can perceive. For myself personally, being closely occupied in the fulfilment of important engagements in my art, I must therefore decline to continue this controversy, at least for the present. I do not know what I may think it advisable to do in the future, but at present I am disposed fearlessly to commit the issue to the verdict of all impartial men, on the facts which have been already adduced.

Assuring you once more that there is no ground for your idea that I charged you or your brothers with knowingly stating anything that is inconsistent with the facts, I remain, dear Mr. Barry, faithfully yours,

E. M. Barry, Esq., A.R.A. J. R. Herbert.

7, Grove End place, St. John's Wood road,
Wednesday, April 8.

Breech-loaders, after all, are no novelty. At a recent meeting of the Royal Archæological Institute, Brigadier-General Lefroy exhibited a "curious breech-loading smooth-bored matchlock arquebus," which bore on it the date 1537, and appears to have belonged to Henry VIII.

Intercommunication.

QUESTIONS.

[817.]—MORTAR FROM OLD MATERIAL.—Will you please to inform me whether mortar composed of old bricks and the rubbish arising from pulling down old houses, ground up with fresh stone lime, has the same lasting properties as mortar made with the proper proportion of river sand and stone lime, well mixed by hand or ground in a mill?—Builder.

[818.]—A DAMP SAFE.—I wish to know how to cure dampness in a safe I built a year ago. It is over a cellar and has 12in. freestone walls, 6in. freestone floor, and an iron door of the usual description. Since the safe was built the inside of the door has been covered with moisture, and books placed in it have been much damaged. I have tried a charcoal brazier in the safe for three months, and for the last six months burned gas night and day. I have also made four small holes in one of the walls. None of these efforts to keep down damp is of any avail.—Banker.

[819.]—ROMANESQUE ARCHITECTURE.—Can you, or any of your readers, inform me through "Intercommunication" whether any of the undermentioned examples of Romanesque architecture have been illustrated, and where they are to be found?—Cathedral of Puy-en-Velay (cloister); St. Cuthbert's (apse); Andernach, Bonn, Heisterbach, and Zinzig (the Romanesque portions). A. M. M.

[820.]—ARTESIAN WELLS.—I should feel obliged if any of your readers could inform me whether the machine invented by Dr. Potts (see *Mechanics' Magazine*, Dec., 1859) has been applied in sinking artesian wells, because, in my opinion, it might be so applied with advantage, having been used already several times with great success in sinking iron cylinders for bridges.—J. D. J.

[821.]—GILDING.—Will some reader kindly inform me the difference between the processes of oil and water gilding?—Nap.

[822.]—COMPO ORNAMENTS.—I should be much obliged to any correspondent who would send me a receipt for making compo ornaments, such as are used in picture frames.—Minor.

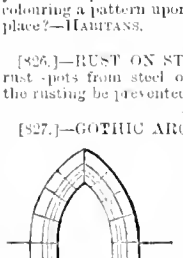
[823.]—CHANGE RINGING.—Is there a practical work upon change ringing from two to eight bells? If so, I should be glad to know the publisher and price.—Changeling.

[824.]—TO MEASURE A DOME.—Will some kind reader give me a rule for measuring the superficies of a semi-circular dome?—Expectans.

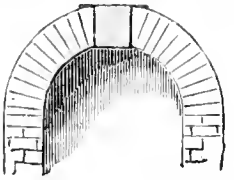
[825.]—PAINTING ON WINDOW-GLASS.—Will one of your correspondents kindly let me know a good plan for colouring a pattern upon window-glass already fixed in its place?—Habitans.

[826.]—RUST ON STEEL.—Is there any way of cleaning rust-spots from steel ornaments; and, if not, how can the rusting be prevented?—J. C.

[827.]—GOTHIC ARCHES.—A friend of mine (an architect) tells me that the straight perpendicular joint in the crown of a Gothic arch, thus, is wrong, being faulty construction. Holding a contrary opinion, and perhaps an erroneous one, I should be glad if any of the numerous readers of the Building News would give me their opinions on the subject? I have consulted "Brandon's Analysis of Gothic Architecture," and I find that out of about seventy-three illustrations where any jointing of voussoirs is shown, seventy-one have the straight perpendicular joint I have described, and which I believe to be perfectly correct and constructional.—Enquirer.



[828.] SUPPORTING A BEAM.—Can any of your correspondents recommend a superior method of supporting a beam under similar circumstances to the one hereunder



depicted; the means of support being a strap of wrought iron, performing double duty as socket for the beam and key to the arch?—F.

[829.]—WROUGHT-IRON ROOFS.—Will E. Swansborough, 6, Great James-street, Bedford-row, be kind enough to show a diagram of the formula for the wrought-iron roofs in Building News of October 18, 1867, and oblige?—Seeker.

[830.]—FLOW OF WATER PIPES.—Will "L. A. B." kindly insert the proof of his formula for flow of water pipes in Building News of January 10, 1868?—Inquirer.

[831.]—WEIGHT OF FALLING BODIES.—Will any of your able correspondents show a formula by which the increasing weight of a block of iron, say 1 cwt., raised to the height (say) of 10ft. or 15ft., more or less, may be ascertained? What would be its weight on the ground, or on any substance by falling?—Ignoramus

REPLIES.

[799.]—PLATINUM DISCS.—Platinum discs may be obtained, 1s. each, at Hodge and Co.'s, Hatton Garden; or any other manufacturing gas engineer would supply them.—F. R.

[800.]—QUANTITIES AND PRICES OF TIMBER.—50ft. cube = one load, *i.e.*, 216ft. 6in. of 9 × 3 = one load, and so on by the usual rule for finding the cube contents of solids.—F. R.

[803.]—MOUNTING DRAWINGS ON CLOTH.—First immerse your cloth in water until wet through, then wring it nearly dry, and nail it tightly upon a board with tacks one inch apart, first nailing down one side, pulling it straight, and then nailing down the opposite side, and so on until the cloth is stretched tight. Place your drawing, face downwards, upon another board, paste it evenly all over, and, the cloth being still wet, lay your drawing upon it, taking care to rub it well down, from the centre outwards, so that no air bubbles be left. A piece of blotting paper must be used over the face of the drawing whilst rubbing, to prevent smearing—F. R.

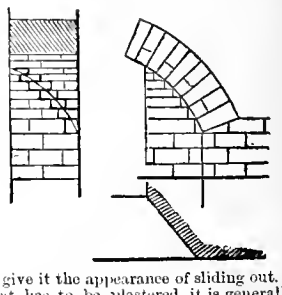
[804.]—EYESIGHT.—If the only light entering an apartment be through a frosted surface, from the extreme whiteness of the light it would very probably in time injure a very delicate eyesight; but the nature of the employment must be taken into account in such cases.—F. R.

[804.]—I have it from reliable authority that working before either frosted or ground glass is injurious to the optics, and can also add my testimony to the truthfulness thereof.—J. Frost.

[805.]—DRAWING INK.—The best medium for drawing upon glass or slate would be Brunswick black. This will stand washing when set, and can be diluted to any extent with spirits of turpentine.—F. R.

[809.]—TENDERING FOR OLD LEAD.—It is usual to allow 5 per cent for dross in weighing old lead; but, to prevent disputes, all contractors should take care that such allowance be mentioned in their agreements.—F. R.

[812.]—FLAT SOFFIT FLUSHING.—In clean brickwork it should not be flushed, but wrought out of the solid, as shown in sketch. To show a joint along the curved



angle would give it the appearance of sliding out. In inferior work that has to be plastered, it is generally flushed up after the centre is taken out, but the arch must run through square on the springing line.—S. Lewis.

WAGES MOVEMENT.

The strike at Newcastle among the bricklayers terminated last week, the men resuming work on the condition of working ten hours per day, except Saturday, and receiving 31s. 6d. per week.

A few days ago a number of workmen on strike made a demonstration at Barcelona, and endeavoured to force their fellow workmen to follow their example. The demonstration alarmed the Government, and they took the unusual course of declaring the whole of Catalonia in a state of siege.

The journeymen painters now on strike in Bradford state that sixpence per hour was promised to them by the employers in 1866, and they were told that it was a reasonable demand, but the employers said they were not prepared to give the proposed advance all at once, and the men did not strike, but accepted ½d. per hour advance for that year, and the same last year. This year, they say, the employers decline to fulfil the agreement, declare they will not meet the men, and decline arbitration. They emphatically deny that the society men have used unfair means towards those out of the society, and assert that most of the latter have come forward voluntarily, asking to be accepted as members, and had left their shops. The men say that all they require is fair play and a truthful statement of the case between them and their employers.

A movement is on foot among the operatives employed in the building trades at Market Drayton for obtaining a reduction in their hours and an increase in wages of 2d. per day. A respectful memorial embodying these requisitions has been presented to the masters. The alterations, if agreed to, are to commence on June 1.

The strike of the workmen at Geneva, stated to have been instigated from London, has terminated. The hours of work are reduced to eleven per diem, and the wages are increased 10 per cent. The men were to resume work on Easter Monday.

A general meeting of the Yorkshire branch of the Master Builders' Association was held at Wakefield, on Monday. After certain formal business had been transacted, the consideration of payment of men by the hour was discussed. It was agreed by the meeting that the principle was just, fair, and reasonable, and that information should be obtained on the subject, in order that the matter might be fully discussed at the annual meeting to be held at Hull, in August next.

The carpenters and joiners of Bradford have made arrangements for the formation of a Board of Arbitration, with the proviso that the present working rules and customs of the trade shall not be jeopardised thereby.

A provisional committee appointed to draw up a code of rules for a proposed Board of Arbitration and Conciliation at Derby, met on Tuesday evening. The meeting, which was attended by employers and operatives representing various trades, was unanimous in a desire to establish such a board and at a late hour was adjourned for a fortnight.

STATUES, MEMORIALS, ETC.

Foley's statue of Burke is to be inaugurated by the Prince of Wales during his stay in Dublin.

The Dean of Salisbury has received a cheque for £500 from the Rev. C. B. Bicknell, rector of Stourton, for the purpose of placing twelve statues in the west front of Salisbury Cathedral, in addition to the forty which have been ordered by the Dean and Chapter. Besides the "Majesty" in the gable of the west front, fourteen statues have already been placed in niches. They are in the style of the thirteenth century, and in point of execution bear a close resemblance to the figures which still exist in the west front of Wells, the execution of which is pronounced, on good authority, to be one of the finest achievements of sculptural art executed during the middle ages.

The unlucky statue of Sir Robert Peel, says a London correspondent, is once more condemned to the obscurity wherein it lay so many years. A sum of £4,000 originally subscribed was offered to the late Baron Marochetti for an effigy of colossal dimensions of the great statesman. When finished, it so utterly disappointed the committee that a suggestion was made that he should attempt one more nearly approaching the size of life. But when finished this in its turn was felt to be so little suited to kindle anything like enthusiasm that it was suffered to rest in the shade of oblivion until the beginning of the present year. A unanimous expression of disappointment swelled in waves of murmur from all who were permitted to see it uncovered while it remained against the new railings at Palace-yard, and accordingly it has been judiciously made away with, at least for the present.

The Dean of Canterbury has published a report on the progress of the statues with which the cathedral is being embellished. The Queen has signified her intention of presenting figures of herself and the late Prince Consort, and a hope is expressed that this example will induce others to take part in the work. Since 1862, when the scheme was originated, thirty-one out of the fifty-six figures contemplated have been erected. Among them are Christ as the Good Shepherd, St. Augustine, St. Anselm, Archbishop Cranmer, St. Gregory the Great, King Alfred, King Canute, Archbishop Becket, King Edward III. and the Black Prince, King Henry VIII., Archbishop Laud, and King Charles I. The figures given, and in course of erection, are Queen Victoria and the late Prince Consort, Bishop Ridley, and Dean Stanhope. Those required and not yet given include King Henry II., King William III., Queen Elizabeth, Mary II. Archbishops Parker, Tillotson, and Richard Hooker.

A monument has just been placed in the churchyard of Madresfield, over the grave of the late Earl of Beauchamp. It is designed by Mr. Preedy, architect, and consists of four panels of grey stone, surmounted with a massive slab of the same, the whole crowned with a cope of highly polished Aberdeen granite, taking the form known as *en dos d'one*.

LEGAL INTELLIGENCE.

Brick Burning.—In a case which came before Sir W. P. Wood, as Vice-Chancellor, it was held that where a nuisance had been of more than twenty years' standing, but with temporary interruptions, the party asserting the right to continue it was bound to show that it had been exercised at least in the first and last year of the period of twenty years, in order to preserve it from being lost. It was not necessary, the Vice-Chancellor said, to prove that any special sickness had resulted to plaintiff or his family from the effluvia arising from the brick-burning, nor that the vapour was more than usually injurious or offensive. It had been held at law that brick-burning carried on in the ordinary way was a nuisance to the persons living within the limit affected by it; and it was such a nuisance as the Court of Chancery would restrain by injunction.

Trade Unionism.—At the Manchester County Court last week before the Judge (Mr. E. Ovens), the case of Walker *v.* Williams was heard. The action was brought to recover £10 upon an I. O. U., the money having been advanced under the following circumstances. Plaintiff and defendant had entered into a contract under which the latter had agreed to build and finish the brickwork for the completion of eleven houses at Collyhurst for the sum of £70, £10 to be paid when the first floor was on, £20 when up to the square, and the remainder when the work was completed. After the work had been proceeded with two days the defendant's men struck, in consequence of some trade union differences; but, as the first floor had been put down, Williams applied for £10, in accordance with the terms of the agreement. Plaintiff declined to pay him anything on account, but consented to advance him £10 upon his I. O. U., and that was the sum now claimed.—The defence was conducted by Mr. Stoney on behalf of Williams, and he stated that the work had satisfactorily progressed for two days, when some labourers out of employment went to the building and said that the defendant was employing one labourer too few. Williams then had in his employment five bricklayers and five labourers, in addition to which he was working himself, and had a boy assisting. He declined therefore to employ another labourer, as requested. A delegate from the union was threatened to be sent for, of which, however, the defendant took no notice; and on the following day the delegate arrived, stating that unless another labourer was employed, he would stop the work. Williams still refused to submit to this dictation, and the consequence was that the work was suspended. The union men further said that they would prevent defendant from working in Manchester, and he had since ceased to carry on business, but had obtained a situation. As a set-off against the plaintiff, he put in a claim for £10, for wages paid to the men.—The Judge said that, although the defendant had been subjected to great hardship, yet he could not admit the set-off, inasmuch as he had not performed the contract. He held a strong opinion as to trade unions, but that court was not the place to express his opinion. He must deal with the case as it was presented to him, and must hold that the defendant could not sustain the set-off. He should, therefore, give judgment for plaintiff.—A number of trade union men were in court during the hearing of the case, and left in a body as soon as the decision was given.

Our Office Table.

According to a communication recently made by Herr Keim to the Polytechnic Society of Berlin, a permanent oil colour can be laid upon cement, and will be found durable if care is taken to rub the surface of the cement three or four times over with acetic acid or vinegar before applying the oil colour.

The frescoes, by C. W. Cope, R.A., in the Peers' Lobby leading to the House of Lords, are now undergoing a new process. A solution of parafine in benzole is being applied to them which, it is anticipated, will make the colouring of them quite secure and prevent any peeling off, and also will enable these paintings to be cleaned without injuring them.

A railroad bridge at Burlington, Iowa (U. S.), now nearly completed, has required over 3,000 piles, and 1,000,000ft. of pine lumber. The bridge is 2,237ft. long, and 7,500 cubic yards of stone have been laid.

"Every person," thinks the *American Inventor*, "who has had any experience with lamp chimneys is aware of the seemingly singular want of uniformity in the length of time they will stand use. Some will last for months, while others, apparently as sound and good, will break after a short use, without any apparent cause. The great cause of their being brittle and breaking so easily lies in the material they are made from. There is 'sheddy' in glass as well as in cloth. Cheapness being the order of the day, a great many manufacturers make chimneys from silicate of lime instead of silicate of lead. The glass made from the silicate of lime has about the following proportions:—Sand, 100; soda, 45; lime, 20 to 25; nitre, 7 to 10. Lime being a non-conductor of heat, the chimney will not bear the expansion caused by the heat; and if, by gradual heating, the chimney does not break on the lamp, a few times heating makes it so brittle that it breaks with the least effort at cleaning it, no matter how much care is used. The silicate of lead has about the following proportions:—Sand, 100; lead, 40 to 50; soda, 20 to 25; nitre, 10 to 15. Lead being very ductile and a good conductor of heat, a chimney made from this formula will almost melt before it will crack with the heat. The uninitiated may tell the difference of the chimneys made of these different qualities of glass by ringing them; the vibration from the lead-glass chimney has a sweet, bell-like sound, whilst the lime-glass has a short, harsh sound. The difference of the cost of manufacture is only, in material, about 8d. per dozen. Another point is in annealing; chimneys as a general rule are not annealed; under a powerful microscope the difference can be seen in the glass; the particles in the annealed glass lie close and compact, while the unannealed seem ready to diverge."

In consequence of the immense number of visitors on Easter Monday and Easter Tuesday, who viewed the Houses of Parliament, far exceeding in number those in the Exhibition year, it is understood that the Lord Great Chamberlain has decided that the "Houses" shall be open to the public on Whit Monday and Tuesday.

The proposal for a new park and public pleasure grounds for Tooting has at last been brought to a successful issue, and this large piece of barren waste land will be devoted to a useful purpose. The common, which has been used for gravel digging, &c., is situated in one of the most picturesque parts of Surrey, and extends over a large breadth of furze and heath lying between Streatham and Tooting, and is in close proximity with Clapham Park.

It is said that some legal difficulties which have only recently been discovered threaten to interfere with the immediate clearing of the ground which is the site of the new Law Courts. Some property which has for a long period been always treated as freehold has, it is stated, been found to be only leasehold, held upon unexpired leases of 300 years, and the legal advisers of the Government have not in all cases been able to trace the individuals who are the real freeholders, and whose interests must be considered before the land is taken possession of by the Crown.

The eastern portion of the Southern Thames Embankment—that between Lambeth Church and Westminster Bridge, will be opened for the public use on the 1st of May next.

The Joan of Arc tower, at Compiegne, fell down the other day, the crash causing great terror in the quarter of the Rue Jeanne d'Arc. Fortunately there was no loss of life.

On Wednesday and Thursday, the 8th and 9th inst., a court was held before the Under Sheriff of the county and a special jury, to assess the amount to be paid by the Great Grimsby Gas Company to the Corporation, for six acres of land, outside the town, required for the enlargement of their works. Mr. Lloyd, Q.C., appeared on behalf of the Corporation, and Mr. Lloyd, jun., Q.C., on behalf of the Gas Company. For the claimants the following gentlemen were called, and the result of their valuations was as under: Mr. P. Bellamy (Lincoln), £6,534; Mr. Maughan (Grimsby), £5,687; Mr. T. S. Woolley (Collingham), £5,400; Mr. Huskisson (Epperstone), £5,066. And on behalf of the Gas Company, the following professional evidence was offered: —Mr. F. Fowler (Sheffield), £1,584; Mr. S. F. Holmes (Sheffield), £1,584; Mr. H. Goddard (Lincoln), £1,515; Mr. J. Brown (Grimsby), £1,380. The jury ultimately awarded the sum of £2,277.

One of the latest instances of American go-a-headism is to be found in Elgin, a town of 5,000 people, on the Fox River, Illinois. Here there is a watch manufactory which sends out 60 watches a day. The machinery was all constructed in Illinois by the persons owning the manufactory, and the speculation was not thought of until 1864.

There is a hitch, it would appear, in the negotiations for the purchase of the Exhibition Palace as a site for the Irish Art Institute. The Government have offered £45,000 for it, after having it valued by an English and Scotch valuator. It was offered by the directors for £60,000, and the Chancellor of the Exchequer declined it upon the terms. A meeting of the proprietors was held at Dublin on Monday to discuss the subject, and after a long conversation it was ultimately moved that a committee, consisting of Sir Benjamin Lee Guinness, Bart., Alderman Manning, Alderman Campbell, Messrs. Arthur Guinness, Switzer, Smith, Clay, Hudson, and Allen be formed, for the purpose of devising the best means of discharging the liabilities of the company, and preserving the building for the citizens of Dublin. The motion was carried unanimously. It was stated during the discussion that the liabilities of the company amounted to £48,000 or £50,000.

Apparently, they have a curious way in Russia of testing a bridge. A communication from Moscow gives an account of the trial of the Borodino Bridge, just terminated over the Moskowa River. The water butts of the fire brigade, all filled, and 60 carts laden with sand, weighing together about 100 tons, were brought on the structure, after which the people who had assembled on the banks were naïvely invited to stand also in the centre. The bridge was fortunately proof against this foolish experiment, for had any accident occurred the consequences would have been terrible. A Te Deum was performed at the cathedral on the occasion, after which the work was blessed by the Bishop Mgr. Leonide, who came in procession with all the clergy of the neighbourhood.

At the monthly ballot of the Institution of Civil Engineers, the following candidates were balloted for and duly elected:—As Members: Messrs. Walthew Clarence Barton, James Bower, William Welham Clarke, Richard Smith Clayton, Francis Jellaius Dennys, James Mathias, John Patou, George Lowe Reid, and David Richmond; and as Associates: Messrs. Herbert Goulburn Anderson, Frederick Cadogan Barron, William Thomas Blacklock, Walter Raleigh Browne, Richard Henry Brunton, Charles Townshend Casebourne, Robert George Clutton, Charles Hutton Croudace, Henry Algernon Shrapnel Fenner, William Randolph Innes Hopkins, William Stuart Howard, Alfred Longsdon, Robert Reynolds, Francis William Robinson, Robert Brough Smyth, William Sykes, James John Wallis, and David William Young; and Sir Arthur William Maekworth, Bart., R.E. It was announced that the Council, acting under the provisions of section 4 of the bye laws, had recently admitted as Students of the institution. Messrs. James Alston Carfrae, John Malcolm Gibson, Charles Selwyn Harris, George Edward Page, and Frank George Wynne.

MEETINGS FOR THE ENSUING WEEK.

Mon.—Society of Engineers,—Discussion on the Sewerage works at Rellhill, read on 6th inst., by Sidney A. Reade, M.A.

Tues.—Institute of Civil Engineers,—1. "Irrigation in India," by Mr. Allan Wilson, M. Inst. C.E. 2. "On the Benefits of Irrigation in India, and on the Proper Construction of Irrigating Canals," by Mr. Thomas Login. 3. "Irrigation in Spain; chiefly in Reference to the Construction of the Henares and the Esla Canals in that Country," by Mr. George Higgin, M. Inst. C.E.

Wed.—Society of Arts.—"On the Cultivation of Beet root, and its Manufacture into Sugar," by W. A. Gibbs, Esq.

Fri.—Architectural Association,—"Hospitals," by T. Roger Smith, F.R.I.B.A.

Sat.—Associated Arts Institute,—Exhibition of Sketches, Subjects, "The River," and "Death."

Trade News.

TENDERS.

Abingdon.—For the erection of a Grammar school for 120 boys, head master's house, and offices, on the Albert Park Estate, Abingdon. Edwin Dolby, architect. Quantities by Mr. J. Crawley:—

Nightingale (too late)	£5363 0 0
Dover	5250 0 0
Cowland	5150 0 0
Thomas and Dicks	5115 0 0
King	5032 13 6
Trow and Sons (too late)	5000 0 0
Selby	4998 0 0
Bull and Sons	4883 0 0
Claridge	4610 0 0

Bexley.—For building a chapel at Bexley. Messrs. Habershon and Pite, architects:—

Butler	£1595
Patman and Co.	1490
Nightingale	1463
Lonagon	1450
Falkner	1159
Paugh	1375
Dabs	1365
Watts	1277
Pearce and Booth	1154

Bexley.—For completing erection of a villa for W. Hall, Esq. Mr. Danby, architect:—

Willes	£1913
Parkes	1876
King and Sons	1665
Nightingale	1653
Regis	1591
Garrud	1560
Rogers and Richards	1196

Derby.—For residence for Frank Campion, Esq., at Derby. Messrs. Thompson and Young, architects. Quantities supplied by Messrs. Waite and Jones:—

Bridgart	£2400
Fryer	2279
Gadsby (accepted)	2174

Gloucester.—For two houses, Spa road, Gloucester, for Mr. Waters. Mr. H. James, architect, Gloucester. Quantities supplied:—

Cullis	£1118
Fream	1090
Meredith	1090
Clutterbuck (accepted)	1050

Guildford.—For alterations and additions to the Old Congregational Chapel, Guildford. Mr. Henry Peak, architect and surveyor:—

	Alterations.	Additions.	Total.
Garnett	£275 0 0	£257 8 0	£532 8 0
Swayne & Sons	206 2 2	262 2 5	468 4 7
Smith	238 0 0	228 0 0	466 0 0
Beagley	214 3 6	246 5 0	460 8 6
Mason	209 14 0	240 6 0	450 0 0
Foster	244 0 0	172 0 0	416 0 0

Staffordshire.—For Inck Hill Church:—

Higham	£2722
Lovatt	2350
Estcourt	2225

Hanley.—For the erection of five houses for Mr. Smith, in Glaistone-street. Messrs. W. and C. Palmer, architects, Hanley:—

Matthews	£1277 0
Ogden	1140 0
Turner and Ward	1030 0
Bennett and Cooke	1030 0
Ellis (accepted)	1063 10

London.—For rebuilding No. 1, St. Ann's-lane, E.C. Mr. Herbert Ford, architect:—

Brass	£1775
Piper and Wheeler	1750
Browne and Robinson	1698
Henshaw	1688
Pritchard	1672
Turner and Sons	1599
Webb and Son	1585
Mann	1512
Crabb and Vaughan	1468

London.—For new building, and raising storey, Featherstone street, City-road. Mr. H. J. Hammond, architect:—

King and Sons	£2053
Eaton and Chapman	2011
Henshaw	1985
Perry and Co.	1985
Macey	1943
Preedy and Son	1710

London.—For three houses and shops in Old-street, St Luke's, Middlesex, for Frederick Ingoldby, Esq. Quantities supplied by Mr. J. W. Forge:—

Turrell Brothers	£2367
Hobson	2537
Porter	2082

London.—For the erection of schools and class rooms, Drummond-street, Hampstead road. Mr. John Tarring, architect, 60, Basinghall-street, E.C.:—

Shurmur	£2,294
Shepherd	2,120
Richards	2,008
Saunders	1,983
R. Mann	1,973
Hill and Sons	1,925

London.—For building Finsbury chambers, Luke street, Finsbury, for F. S. Foster, Esq. H. I. Hammon, architect, 7, Finsbury-square, E.C.:—

Bishop	£30,155
Thorn and Co.	29,000
Moreland and Burton	28 950
Myers	28,565
Brass	27,750
Browne and Robinson	27,720
Eaton and Chapman	26,500
Macey	26,160
Hodgson and Porter	24,779
Henshaw	24,491
Webb and Sons	24,480

Newcastle-under-Lyme.—For laying out and draining street for Mr. R. Slaney. Mr. C. Lynam, architect, Stoke-on-Trent:—

Broomhall	£743
Bryan	589
Parton	472
Edwards	430
Pearce	392
Smith (accepted)	234

Nottingham.—For the enlargement and partial rebuilding of Trinity Free Church, Nottingham. Messrs. Thomas C. Hine and Son, architects:—

Barker	£1260
Wright	1244
Rushworth	1214
Stevenson and Weston	1202
Simpson and Lynam	1179
Marriott, Wartnaby, and Scott	1174
Bell and Wood	1149
Vickers	1143
Booker	1140
Dennett and Co.	1095
Wood and Slight	1075
Blundell	1064
Moore	1030
White (accepted)	1018

Stoke-on Trent.—For the erection of a mill and engine house for Mr. M. D. Hollins. Mr. C. Lynam, architect, Stoke-on-Trent:—

Bradbury	£4370
Oakley and Minks	4190
Wooldridge	4178
Collis and Hudson	4118
Barlow	3750
Sutton (accepted)	3750
Matthews (withdrawn)	3187

Sydenham.—For enlarging Sydenham house, Sydenham, exclusive of shop fronts and fittings. Mr. J. W. Dennison, architect:—

Tully	£1230
Woodward (accepted)	£1090

Taunton.—For a villa residence at Mountlands, Taunton, for Mr. Peter Taylor. Mr. S. Shewbrooks, architect:—

Spiller	£1075
Smith	799
Fox	785
Aplin	745
Shewbrooks	730

Teddington.—For residence at Teddington. Mr. Chas. Aldridge, architect. Quantities supplied by Mr. L. C. Riddett:—

Warne	£2090
Anson	1894
Gammon	1661
J. and W. Sanders	1618
Capps and Ritso	1598

PROPERTY SALES.

April 7.

At the Mart.—By Messrs. Driver and Co.—Leasehold town residence, No. 8, Cavendish-place, near Regent's Park, term 53 years unexpired at £25 per annum—Sold for £5,900.

Leasehold stabling and coach house, premises, No. 15, Queen Anne's-mews, adjoining above, term 14 years unexpired, at £36 per annum—£5.

Freehold four houses and shops, Nos. 51 to 54, Millbank-street, Westminster—£4,500.

Leasehold house, No. 13, Church street, Westminster, let at £65 per annum, term 16 years unexpired at £32 per annum—£325.

By Messrs. Debenham, Tewson, and Farmer.—Freehold two houses, Nos. 30 and 31, Crimscott street, Bermondsey, annual value £56—£350.

Freehold nine acres of building land in Acton-lane, and two copyhold houses, let at £20 per annum, facing Acton-green—£5,860

Freehold residence, No. 2, Ebor-terrace, Albion-road, Stoke Newington, let at £46 per annum—£650.

Freehold residence, No. 7, Ebor-terrace, let at £48 per annum—£610.

By Mr. George Prickett.—Leasehold six houses and premises, Nos. 61 to 66, Upper Ground-street, Blackfriars-road, producing £69 10s. per annum, term 96 years from 1800, at £20 5s. per annum—£360.

Leasehold house, No. 5, West square, St. George's-road, Southwark, let at £30 per annum, term 37½ years from 1794, at £10 10s. per annum—£125.

Leasehold house, premises, and piece of land in Great Dover-street, Borough, producing £81 per annum, term 61 years from 1824, at £25 per annum—£430.

Leasehold sixteen houses, premises, and stabling in Ann's-place and Lant-street, Borough, producing £369 per annum, term 97 years from 1840, at £70 per annum—£1,690.

Leasehold two houses, Nos. 298 and 300, East-street, Old Kent-road, producing £52 per annum, term 69½ years from 1814, at £5 per annum—£355.

A renter's share and free admission to the Theatre Royal, Drury-lane, held for 75½ years from 1819—£65.

April 8.

At the Mart.—By Mr. F. Lewis.—Leasehold three houses (one with shop), Nos. 1 to 3, Collier-street, Pentonville, producing £77 1s. per annum, term expiring in 1884, at £3 13s. 6d. per annum—£485.

By Mr. Newbon.—Leasehold residence, No. 4, Compton-terrace, Upper-street, Islington, annual value £100, term 96 years from 1821, at £10 per annum—£1,120.

Leasehold two houses and shops, Nos. 297 and 299, Holloway-road, producing £125 per annum, term 98 years from 1862, at a peppercorn—£1,400.

Leasehold five houses, Nos. 9, 10, 60, 62, and 63, Belmont-street, Chalk Farm-road, Kentish Town, producing £19 4s. per annum, term 99 years from 1864, at £6 6s. each per annum—£1,870.

By Messrs. C. C. and T. Moore.—Freehold two houses, Nos. 25 and 26, Regent-street, Brunswick-street, Poplar, producing £31 4s. per annum—£170.

Freehold two houses, Nos. 5 and 6, North-street, Limehouse, producing £21 9s. per annum—£220.

Leasehold two houses, Nos. 176 and 177, Eastfield-street, Limehouse, producing £29 18s. per annum, term 53 years unexpired, at £4 4s. per annum—£160.

Leasehold eight houses, Nos. 17 to 24, Silver-street, Stepney green, and a shed adjoining, producing £63 per annum, term 4 years unexpired, at £5 5s. per annum—£95.

Freehold two houses, Nos. 1 and 2, Oriental-villas, Goldsmith's road, Low Leyton, annual value £46—£480.

Freehold house, No. 1, Prospect-villas, Church-road, Low Leyton, annual value £30—£290.

Freehold five houses, Nos. 1, 3, 5, 7, and 9, Cullum-street, Martin-street, Stratford, producing £111 16s. per annum—£1,150.

Leasehold four houses, Nos. 7 to 10, Suffolk-street, Rotherhithe, let at £18 4s. per annum, term 90 years from 1860, at £2 5s. per annum—£600.

Leasehold eight houses, Nos. 3 to 10, Essex place, Old Bethnal-green road, producing £130 per annum, term 31 years unexpired, at £3 5s. per annum each—£765.

By Messrs. Fuller and Marr.—Freehold three houses, Nos. 13, 12, and 7, Mortimer terrace, Kentish Town-road, producing £89 12s. per annum—£1,170.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Henry Barfoot, Princess road, Notting Hill, slater, April 22, at 1.—Charles Goodman, Bow, Middlesex, builder, April 22, at 1.—William Warne, Parker street, Drury lane, builder, May 1, at 12.—Samuel Dolman, Victoria grove, South Hornsey, bricklayer, May 1, at 2.—John James Keys, Hammersmith, builder, April 29, at 1.

TO SURRENDER IN THE COUNTRY.

Thomas Walter, Bristol, carpenter, April 24, at 12.—Job Crossley, Barnsley, plumber, April 28, at 11.—Thomas Hughes, Penmaenmawr, mason, April 28, at 12.—Charles Whitworth Morris, Dewsbury, painter, April 30, at 12.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

April 30, G. Basset, Rochester, builder.—April 30, J. F. Field, Wood street, Upper Clapton, builder.—May 1, P. R. Hodge, Adam street, Adelphi, civil engineer.—May 1, E. J. Wallis, Golborne-road, Paddington, builder.—May 4, A. G. Bowe and J. Eccleston, Clarendon-street, Harrow-road, plumbers.—May 4, E. Herbert, Mardon-road, Bermondsey, plasterer.—May 5, T. Smith, Pickering place, Bayswater, builder.—April 24, T. Jackson, Pudsey, stonemason.—May 5, W. H. Green, Glastonbury, carpenter.—April 25, T. Shepherd, Worksop, builder.—April 24, W. Belt, Hull, plumber.—April 22, T. L. Ball, Merthyr Tydfil, painter—May 4, J. W. Liddell, Bromley, Kent, builder.—May 6, R. Grant, Croydon, stonemason.—May 6, T. Ginger, New Barnet, carpenter.—May 4, J. Oldham, Barrow-in Furness, builder.—May 4, E. P. Nicholson, Shaw house, near Alston, joiner.

SCOTCH SEQUESTRATION.

Hugh and Colin Murray, Bishopmill, near Elgin, builders, April 26, at 1.

DIVIDENDS.

April 27, B. Ord, Middlesborough, slater.—April 24, C. Moyse, Farnham, All Saints, Suffolk, carpenter.—April 25, J. Fryer, Bidford, timber merchant.

PARTNERSHIPS DISSOLVED.

Hiller and Leslie, Isle of Thanet, brickmakers.—Stead and Co, Hillhouse, near Huddersfield, builders.—Sanders and Hindley, Manchester, stonemasons.—Thomsett and Parsons, Sussex road, Brixton, bricklayers.

THE BUILDING NEWS.

LONDON, FRIDAY, APRIL 24, 1868.

NATIONAL PORTRAIT EXHIBITION.

[Second Notice.]

In our former notice of these portraits, it was remarked that of a large majority of them even the general public will have no doubt as to the individuals whom they represent. Where the portraits themselves may not be familiar, engravings have given them popularity. It may be said that nearly every very celebrated Englishman and Scotchman who has lived and died since the year 1800 is here. Several of the notabilities are, indeed, largely represented. There are five portraits of Nelson, taken at different periods of the great captain's life, by Devis, Rigaud, Guzzardi, Gainsborough, and Abbot. Of Canning there are five portraits, all by Lawrence, besides an early portrait by Hoppner; while Sir Walter Scott is likewise drawn by five different pencils—those of Saxon, Raeburn, Grant, Faed, and Leslie, the last a cabinet likeness, which seems perfect. No other poet, statesman, or warrior has received the like honour, though the instances are by no means few where there are two and three portraits of the same individual. As a rule, a man's popularity measures the number of his portraits, and if these are not always the best they will at all events attract the most attention. But there are many portraits in the exhibition which, though not belonging to the most prominent of great men, nevertheless deserve a more than passing glance from the visitor—for the sake of the man, or the art, or both. Of the many thousands of persons who have visited South Kensington during the last ten days, only an infinitesimal number, we dare say, has stood a single minute before the portrait of William Blake, probably the most unpopular of men, artist or poet, yet certainly one of the most noteworthy characters in the exhibition. He is here limned by Thomas Phillips, seated, pencil in hand, and looking up as if for a vision. The descriptive note in the catalogue says, of the engraver, painter, and poet, that he was distinguished by a grand, wild visionary genius. It informs us, further, that he was born in London, 28th November, 1757; apprenticed to an engraver, for whom he made drawings from the monuments in Westminster Abbey, and afterwards studied at the Royal Academy; that he published "Songs of Innocence" in 1789, and "Songs of Experience" in 1794, besides other effusions; and that he illustrated Mary Wolstoncroft's "Tales for Children," Young's "Night Thonghts," the "Book of Job," &c. But those who would learn his wonderful story must read elsewhere. It is curious to notice the great diversity of opinion that exists with regard to Blake. The *Edinburgh Review*, thirty years ago, thought he could scarcely be considered a painter at all, while Fuseli, with characteristic candour as Mr. Gilchrist says, used to declare, "Blake is d——d good to steal from." Flaxman said that his poems were as grand as his pictures—poems which Wordsworth only looked upon as the productions of insane genius. The merits of "this most supersensuous of the sons of art," as David Scott, a kindred genius, calls Blake, have become better known and appreciated of late, particularly since the appearance of Mr. Gilchrist's life of the painter, published five years ago by Messrs. Macmillan and Company. This work consists of two handsome volumes, and is illustrated from Blake's own works by Linton, and has the fac-simile of a portrait on ivory, painted from the life by John Linnell in 1827—the year of Blake's death—very interesting. The author of the life of Etty succeeded in giving us something like a just conception of the character of Blake, and the biography is one of the most curious and interesting in the language. Then, the other month, Mr. Swinburne, the poet, favoured us with "A Critical Essay" on the painter. This book is very long, often confused and conceited, and seldom coherent. It is dedicated to Wm. Michael Rossetti, one of Blake's most ardent admirers, and is only valuable for the fact that its author is able, on the good authority of Mr. Linnell, to contradict the story about Blake and his wife sitting as Adam and Eve in their garden in Hercules-buildings, Lambeth. Blake did many a queer thing, but we are now assured that he never did anything so repulsive and absurd as that. In spite of the obscurity which has hitherto surrounded the painter's name, his drawings and prints now fetch prices, which, as Mr. Gilchrist says, would have solaced a life of penury had their producer received them. So much for William Blake. In another room may be seen the honest, good-natured countenance of Thomas Bewick, the engraver (by Nicholson), who was in all respects the very antithesis of the other, and died the year after him. Not far distant is Lonsdale's portrait of William Sharp, another distinguished master of engraving, who died in 1824. In addition to the pictures formerly mentioned, the Institute of British Architects contribute a good portrait of Thomas Philip, Earl de Grey, one of their presidents, painted by John Wood, as also portraits of Nicholas Revett (1721—1804), and Sir Robert Taylor (1714—1788). Neither canvas has got the artist's name. Revett, a Suffolk man, was an extensive traveller and writer on architecture. He went to Italy and Greece with "Athenian" Stuart, and assisted in editing the latter's "Antiquities of Athens." In 1766, he accompanied Chandler to Asia Minor, and edited with him the "Ionian Antiquities." Revett was also the architect of the Church of Ayott St. Lawrence, Herts. Taylor was sculptor as well as architect. Guest's monument in Westminster Abbey, and the figure of Britannia at the Bank of England, were from his chisel. Originally the son of a London stonemason, he lived to be knighted, and to amass a large fortune, part of which he left for the foundation of the Taylorian Institution for the study of modern languages at Oxford. Near the Smirke portrait is that of George Dance, R.A., Professor of Architecture to the Royal Academy, and son of the architect of the Mansion House. It is a successful work by Jackson, whose portrait of Sir John Soane, the property of the National Gallery, also finds a place in the exhibition. It has been suggested that the collection is too large, and there can be no doubt that a little weeding would improve the exhibition. Perhaps, too, some of the five portraits of George Canning might have given place to some others rejected for want of room (this being a regret of the committee), the more so as all these portraits are by one artist. At the same time every visitor will admit that out of these nine hundred portraits very few are wholly uninteresting or out of place in an exhibition of this kind. The interest differs just as the features of the individuals represented differ, and some of the portraits will of course strike one and please one more than others. We have already glanced at some of the more noticeable and generally interesting portraits—the *chef d'œuvres* of the exhibition; let us indicate one or two more. A picture of Raffaelle, it has been said, teaches virtue, and the saying might be applied to some of the treasures at South Kensington. Nobody, we fancy, can look upon the portrait of William Wilberforce, by Richmond, without being the better for it. The little man sits in a big chair the "very picture" of bright intelligence, contentment, benignity, and all that is good in human nature. There is a charm and fascination in the face of Wilberforce far more attractive than the bewitching smile of Lady Hamilton as a *bacchante*, which critics have described in such glowing terms. This is a picture at which we linger, and come away satisfied. Hanging by its side is Lane's fine portrait of Clarkson, the vigorous advocate of the abolition of slavery, and the friend of Wilberforce. There is a good portrait of Pitt, by Gainsborough, and a more striking likeness by Hoppner. Gainsborough's wizard like countenance of Erskine is also here, and we have Fox and Sheridan from the pencil of Reynolds. Lords Eldon and Stowell, by Owen, and a second and better portrait of Eldon, by Lawrence, hang close by. Turner's well-known portrait by himself has been contributed by the trustees of the National Gallery, and grouped not far apart from each other are Sir Astley Cooper, Sir H. Halford, Sir Matthew Wood, Sir James Mackintosh, Dr. Abernethy, Jeremy Bentham, Dalton (the author of the Atomic Theory), and Sir H. Davy — a glorious galaxy of intellect. Cobbett and Giffard, of the *Quarterly*, are represented, with a whole host of contemporary poets and writers to keep them company. The Lake school is particularly well represented. Byron, Shelley, Keats, Kirk White have not been overlooked, while the portraits of Christopher North, Lockhart, Crabbe, Southey, Leigh Hunt, and Samuel and Hartley Coleridge are among the best in the exhibition. There is a very fine portrait of John Constable, R.A., which is hung very high, and not seen to advantage. Edward Dayes's portrait, by himself, shares the same fate—a clerical-looking gentleman who was a water-colour painter, and the teacher of Girtin. He died in 1805. There is more than one portrait of Macaulay and Thackeray, each being represented in his study; and everybody will delight to look upon the sharp, keen, and sensitive face of Hood, and that of Rogers, with its serene and benevolent expression. The portraits of Sydney Smith, Theodore Hook, Hookham, Frere, and Douglas Jerrold will recall many pleasant thoughts and diverting reminiscences. The portion of the gallery which is allotted to the portraits of those eminent men in arts, in arms, and in politics who have adorned the Victorian era is crowded with master-pieces of portraiture. There are portraits of Peel, Palmerston, Daniel O'Connell, Lord Lyndhurst, Sir G. C. Lewis, Sir F. Buxton, the Duke of Newcastle, Cobden, Lord Aberdeen, Lord Herbert, and Lord George Bentinck, Lord Campbell, Sir W. Molesworth, Macaulay, Hallam, Lord Rosse, Faraday, Sir W. Peel, Lord Clyde, and General Sir C. Napier, and other great names which have passed into history. The portraits of distinguished women which grace the galleries, and of which there is a large number, give a special attraction to them. There is a full-length portrait of the Queen, by Winterhalter; a second likeness of Her Majesty as the Princess Victoria is very charming. There are two portraits of the Princess Charlotte—one representing her as an interesting child of four or five years old holding up some music to her mother, who is supposed to be playing upon the harp—a rather fanciful picture this; and another as a young woman, it must be owned, somewhat coarse and vulgar-looking. Mrs. Robinson, as "Perdita," is represented by more than one portrait by Reynolds and Romney, as is also Lady Hamilton, and both ladies will attract many admirers. Reynolds's Jane, Duchess of Gordon, Mrs. Opie's portrait, by her husband, and the Countess of Mansfield, by Romney, also deserve notice. But one of the most charming of the modern pictures is the group of Henrietta, Countess of Warwick, with her two children. The face of the little girl is angelic, and the little boy her brother is a perfect study. The

whole picture is very cleverly painted, and exceedingly happy in conception. Romney's own portrait, and that of his blind father, is another striking picture, drawn with great force. But our space is exhausted, and we conclude by advising everybody who has not yet done so to go and spend a day at the National Portrait Exhibition. A more delightful and instructive place it would be impossible to name. It has been happily said of this exhibition that it "concludes that pictorial history of England in three volumes of which the pages are the faces of illustrious men and women and the authors are the great artists of many centuries."

THE PRACTICE OF ENGINEERING FIELD WORK.*

THE connection between the title of the present volume and its contents is not by any means apparent. In fact, it is of a character so slight as to cause the former to be a complete misnomer. By the term "Engineering Field-work" is usually understood by the profession that knowledge, both theoretical and practical, of the several operations required for transferring the plans of any undertaking from the paper to the ground. In this sense, which is alone the correct one, it includes the calculations necessary for using both the level and theodolite, with the information requisite for laying out curves, surveying, setting out bridges and other foundations. The reader will be rather surprised to find that, under the above title, the whole volume is simply a compilation of reports, specifications, and descriptions of works and processes that have been all previously treated of, and which might have been compiled by anyone possessing no professional qualifications whatever. The author, in the preface, by a direct *petitio principii*, assumes what every engineer knows to be still a completely unsolved problem, that is, the economical utilisation of sewage. That it has been successful in a few, a very few exceptional instances, there is no question; but it is equally irrefutable that it has miserably failed in the majority of cases, and the bare fact that it is almost impossible to raise capital in its behalf is the best proof of the distrust in which it is held. We do not for a moment deny the ultimate success of the utilisation of sewage, but we do emphatically maintain that it has at present not arrived at that stage which can, in an honest sense, be termed a success.

In the first chapter, which treats of the different qualities of water and their various impurities, due force is attached to the present inadequate character of the London water supply, and it is justly observed that it will probably require a metropolitan epidemic before the necessity is perceived for adopting one of the great and comprehensive schemes now some time before the public and the Government. Chapter II. deals with the water supplies of various towns, including Brighton, Manchester, Edinburgh, Cambridge, Bristol, and others, and investigates the relative advantages and disadvantages of the different methods of ensuring either a constant or intermittent supply. The difficulty to be overcome with respect to a constant supply is the exercise of such a control and surveillance as will prevent waste upon the one hand, and yet at the same time not partake of too stringent or inquisitorial a character. The invariable occurrence of an enormous waste of water has always been the objection urged against the adoption of a constant supply, but there is no actual necessity for any waste to take place if proper powers of inspection and supervision are granted by the Waterworks Act to the company, together with authority to prescribe the best description of taps and plugs, and, if necessary, to enforce their use to the exclusion of all others. The consumption at Edinburgh, owing to the company not having authority of this nature, averages about 35 gallons per head, whereas by taking the proper precautions to obviate intentional waste and accidental leakage, the rate might be reduced to 20 gallons at the outside. So far as its waterworks are concerned, Edinburgh is particularly fortunate. It is supplied upon the principle of gravitation, and no pumping is required, since the greatest height at which the water can be delivered is 450 feet above the level of high-water mark. As an instance of the magnitude to which waste sometimes attains, it may be mentioned that at Cambridge, upon one occasion when the ball-cock of a water-closet cistern was out of order, the water ran away at the rate of 10,000 gallons per diem, and in consequence of the waste pipe being improperly connected with the drain, there was no suspicion that so enormous an amount of leakage was taking place.

As a contrast to Edinburgh and Cambridge, we find Bristol supplied with water upon the intermittent system, in which it also appears a large amount of waste takes place. The source of the loss lies in the water-closets, which, when constructed upon the old principle, allowed of the valves being propped up, so as to remain open all night, and during the whole period of the delivery of the water. This habit, which was very prevalent, has been checked by the introduction of a new description of closet, which does not allow of any such tampering. In balancing up the comparative merits of the two systems, it may be stated that, by using suitable valves, taps, and cocks, waste may be equally prevented in both methods of supply. There is no need of cisterns, save for water-closets, in the one method, but as they occupy no particular space exclusively, their presence is scarcely perceived. Where the cistern is nothing better than an old water butt or dirty tub, no doubt a considerable degree of fouling takes place; but if a cistern be covered over, and the water be tolerably pure, it will remain free from sediment for a long while.

The dispute that was carried on respecting the relative merits of sewers and pipe drains may be possibly yet fresh in the recollection of our readers. Some advocated large brick sewers, others smaller sized pipes. The Parisians have committed themselves to the former, their principal sewers being sufficiently capacious to admit of men walking upright in them; it has, however, been supposed upon good authority that these large underground thoroughfares were constructed quite as much with a strategic intention as with that of carrying away the storm water and the surface drainage. There is at present no sewage by water carriage, strictly speaking, in Paris. The fourth chapter of Mr. Haskoll's book treats of the subject of sewers and pipes. A wide difference in opinion has existed with regard to the limit at which it is more economical to employ brick than pipe drains. At first sight it would appear that it would be cheaper and less laborious to simply lay and joint a series of lengths of pipes than to build a sewer, but practice has demonstrated that where the diameter of the drain exceeds eighteen inches, the brick sewer is to be preferred in every way. With earthenware pipes exceeding certain dimensions, the risk of breakage is very much increased, and the joints moreover require particular care and attention in laying. At page 77 there is a palpable typographical error, where agricultural land is spoken of as worth £100 and £200 per acre, instead of from £10 to £20. Respecting the best form of sewer, the proper rate of inclination, and other details in connection with them, some useful information is given in the chapter under consideration, and the author's views are sound and clear upon the matter. We would recommend the beginner and the pupil to draw to a scale of about half an inch to a foot the various sections mentioned by Hawksley, Neville, and other eminent hydraulic engineers, as those most suitable for sewers, and then to carefully compare their different capacities and advantages. The eye, although not always an infallible guide, will nevertheless readily perceive those instances in which the correct principle has been departed from. There is a great deal of truth in the remarks relating to clay puddle, but it must not be forgotten that the substitution of concrete would be attended upon a large scale with a commensurate degree of additional expenditure. The real difficulty in puddling any bank, arch, or wall, is not so much in obtaining suitable material as in ensuring it being thoroughly consolidated and beaten up, so as to become completely incorporated throughout the entire mass. In Eastern countries, where the mode of constructing reservoir and water embankments is of a very primitive character, the operation consists of the successive addition of small portions of earth tipped from baskets carried upon the heads of the labourers, and trodden in and amalgamated by the pressure of innumerable feet, the whole mass becoming by these means so effectually incorporated as to be altogether impervious to water. That the material, which is always that obtained upon the spot, has little or nothing to do with the success of the work, is abundantly proved by the fact that it is frequently not possessed of any other qualities which would render it suitable for ordinary puddling. The case of the Vartry embankment has demonstrated how little puddling is to be relied upon as a means of making a watertight joint over the extrados of an arch, and the citizens of Dublin are paying a severe penalty for the blunders of those who had official charge of the works.

In the last chapter the question of sewage is gone into. We differ *in toto* from the author when he states that the present water-closet system is doomed, and are of opinion that no system of sewage can ever be so effectual, so cleanly, so wholesome, and so much in consonance with English tastes and ideas as that at present adopted in London, which for its population is the most healthy city in the world. The argument put forward respecting the pollution of streams is shallow, as there is not the slightest necessity that the employment of the water carriage principle should contaminate rivers and streams to the extent of a single grain. Manchester is not a very felicitous example to quote with regard to the cesspool system, since it costs the corporation £10,000 per annum to empty them. We would take this opportunity of warning those who are in favour of the cesspool principle, whether fixed or portable, not to be beguiled by such terms as ashpits and reservoirs, which to all intents and purposes are cesspools, the difference being simply one of degree, not of kind. All deodorisers have utterly failed to ensure, what is the real point, a sale of the substance so deodorised as manure. The farmers will have nothing to do with it at any price, and will hardly cart it away when they may do so gratis. Neither can we agree with the author that "the conveyance and distribution of sewage may also be a great nuisance," nor do we comprehend how such a statement can be put forward when the conveyance and distribution of sewage may be witnessed daily both at Croydon and Barking, and visitors can easily satisfy themselves, as we have done, of the complete absence of all smell or escape of noxious gases. The advocates of the cesspool system forget that in a dry summer, the water with which the sewage is diluted would be of more value than the sewage itself. Drought is one of the most fruitful sources of an infecundity of soil. That the water carriage principle is in every sense the best mode of getting the sewage away from human dwellings, there is no doubt, but there is also no doubt that the

* 'Waterworks, or the Distribution of Water in Towns under the Constant and Intermittent Systems; Gauging Streams, Sewers, Sewage, and Irrigation. By W. Davis Haskoll, Civil Engineer, author of "Railway Construction," 4 vols., £5 5s., and "Engineering Field Work." First Volume, 20s. Vol. II. London: Atchley and Co., Engineering and Architectural Publishers, 166, Great u sell street, Bedford-square 1868.

DESIGN FOR A LYING-IN HOSPITAL.—GROUND PLAN.

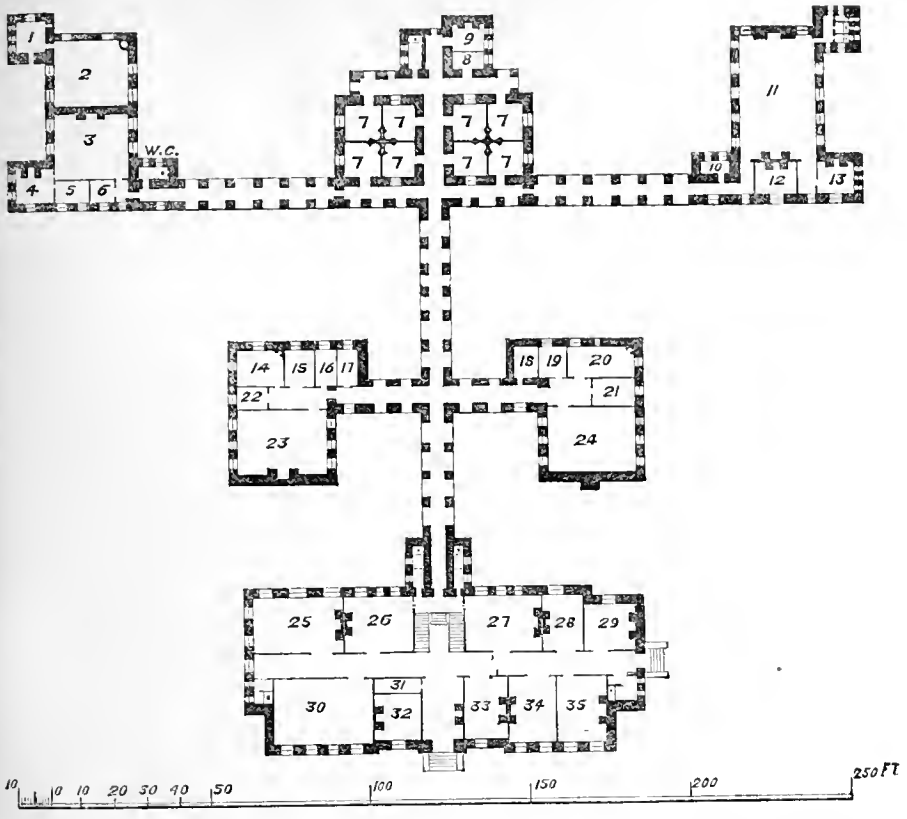

Table.

1. Laundry.
2. Washhouse.
3. Ward for puerperal fever.
4. Nurse.
5. Scullery.
6. Storeroom.
7. Cells.
8. Scullery.
9. Nurse.
10. Scullery.
11. Convalescents.
12. Nurse.
13. Bath Lavatories.
14. Ward (separation).
15. Scullery.
16. Bath.
17. W.C.
18. W.C.
19. Pantry.
20. Common Dining room.
21. Scullery.
22. Nurse.
23. Infirmary.
24. Kitchen.
25. Pupil's Waiting room, and for examinations.
26. Labour room.
27. Waiting room and Board room—Secretary.
28. Medical director's Bed room.

30. Lecture room.
31. Ambulance.
32. Porter.
33. Waiting-room.
34. Medical director's sitting room.
35. Ditto.

best means of utilising it has yet to be determined.

A short chapter on traverse surveying—a subject utterly irrelevant to the rest of the book, although the only portion bearing out the title—concludes the volume, which, as a compilation for the purpose of reference, possesses a certain amount of value, but yields in this respect to M. Krepp's book, although the latter is nothing more than an unmitigated puff of Liernenr's cesspool system. "Engineering Field-work" is well printed and got up, but the price is beyond all reason for the value of the contents. A third of the sum would have been nearer the mark, especially since there is not a single plate attached to the book.

MATERNITIES, WITH A DESIGN FOR A LYING-IN HOSPITAL AND MIDWIFERY COLLEGE.

By F. Oppert, M.D., M.R.C.P., London.

THE question as to whether we should have lying-in hospitals at all has lately been again brought before the public, and the total abolition of them proposed on account of the alleged higher rate of mortality in these institutions compared with that of women confined at their homes. Statistics have been adduced to prove that domiciliary maternities are far more preferable, and it may not be out of place to consider to what extent they may be relied upon. The records of hospital cases are usually exact, especially of State hospitals as they exist on the continent, and no death is likely to be omitted, whereas many difficulties exist preventing the reports of domiciliary maternities being equally correct. Though some—not all—of these institutions make it a rule for the midwives to report on the cases, this is not always done properly. Many of the midwives are bad reporters, ignorant, and too much occupied with the care of their precarious existence to attend to this matter. Where the medical officers of the institution are called in when the case takes a bad turn, the fatal issue is recorded; but sometimes the advice of other practitioners is sought, according to the whim of the patient or her relations. Also cases are reported as having ended favourably, which afterwards end fatally. If of a number of one hundred cases treated at the homes of the patients one death is omitted in the report, the death-rate is evidently stated one per cent. too low. A low death-rate is thus obtained, which, by adding the omitted cases—say one per hundred—makes a higher rate than that of hospitals.

Those who base their calculations on the reports of the Registrar-General, comparing the number of births with that of deaths in child-bed, omit all the cases of lingering disease which yet end fatally. Again, hospital cases are of a graver nature, as those are often sent to the institutions, where irregularities occur. But, though the statistics may be fallacious, still the broad fact remains that puerperal fever, the greatest scourge of lying-in, frequently breaks out in hospitals administered and constructed as they are at the present time. It is the writer's conviction that much can be done to prevent this, and before such an experiment has been tried the hospitals should not be condemned. Moreover, they are not likely to be suppressed, for two reasons. Firstly, we want them for certain classes of the population who cannot be confined at home, and, secondly, they are required for clinical instruction of midwives and medical pupils.

The education and training of midwives should be improved in connection with the hospitals. Honorary medical officers should not be expected to work gratuitously, as the duties are too onerous. No midwife should practise without supervision unless licensed, and none should obtain the licence without having passed a course of lectures on a uniform plan, and they should have a popular manual for their use.

The plan of construction of a lying-in hospital should unite the advantages of the hospital system with those of a domiciliary maternity. The principal feature of the appended design is that the lying-in women are confined in cells, enjoying almost the same isolation as at home. The cells should be large, and exposed to the free circulation of air, as the gallery in front and behind is intended to be open the greater part of the year. The passages have four feet less elevation than the cells, by which means it is possible to place separate top windows above them.

The separate blocks are one floor high, except the front building, which may have three storeys, basement, and attics, by carrying the centre part one floor higher. This building contains the rooms of the director and other officials, a large and light lecture room, store and sleeping rooms, as also accommodation for females awaiting their delivery. The labour room is on the ground-floor, and contains three beds, a desk for the medical men on duty, lavatory, screens, &c. The patients are removed to the cells in an ambulance—a carriage on three wheels properly constructed.

The kitchen and infirmary are in separate buildings, and a separation room belongs to the latter. Cases of puerperal fever are removed to a separate ward, with nurse's room and scullery attached to it. All the blocks are connected by galleries, intersected at some parts with open spaces as far as practicable. The convalescents are accommodated in the convalescent ward, and, when needed, temporarily, in the front building.

ADMINISTRATION.

As it is of the utmost importance that the institution is administered on sound sanitary principles, the highest authority lies with the medical director. He has to watch that every room and ward are in a healthy condition, that they be kept empty and cleansed when advisable, that the furniture, especially beds, are disinfected whenever a suspicious case has been in the ward, that the patients are properly transferred from one part to the other. The usual time patients stay in the cells is eight or nine days. They may stay a fortnight longer in the convalescent ward. The medical director is appointed by a government board or by the minister of the interior for a period of (say) ten years. He superintends the college and the pupils, and gives lectures at stated times. He visits most of the patients daily, and receives reports on everything of importance. He is assisted in his duties by

the head midwife and the resident medical officers. The senior physician accoucheur takes his place in his absence. The medical director publishes correct annual reports, he presides unless prevented at the sittings of the economical committee, and plans the lectures for students and midwifery pupils.

The hospital is principally supported by Government grants, but also by voluntary contributions and fees from pupils. The economical committee (consisting of gentlemen who consent to sacrifice some of their time to the interests of an important charity) superintend the matron, and provide the establishment with victuals and necessaries; it settles tradesmen's accounts and enters into contracts, &c. Whenever the director and committee disagree the arbitration rests with the Government board. The head midwife gives lectures to the midwifery pupils, the senior and junior physicians to the students, and these officers also superintend the domiciliary confinements, which the pupils attend to and visit the females in common with them. Special care should always be bestowed on cleanliness, lavatories, hot water supply, towels, &c.

It might be objected to the design that the expense would be too heavy, that the buildings occupy a large piece of ground, and that the costs of maintenance, nursing, salaries, &c., come to a high figure. But the evident advantages overbalance these objections. Unless all our present ideas of sanitary arrangements are erroneous the plan offers the best conditions of having a healthy hospital, free from puerperal fever. The advantages of emptying for a time, and transferring patients from one building to another, are combined with the isolation obtained by the peculiar cottage-like arrangement of the cells; and the advantages of the pavilion system are enhanced by having open or intersected galleries. The benefits derived from domiciliary assistance are included in the plan, and the college supplies a want by educating a numerous class of useful pupils. The grounds are partly to be used as kitchen gardens. Lastly, so much of the plan may be adopted as seems useful, and an extension is not difficult.

THE EARTH SYSTEM.

To the Editor of the Building News.

Sir,—The evils of our present system of house drainage are acknowledged. We carry away by very imperfect contrivances the refuse of our dwellings into the rivers and streams, thus polluting the waters and wasting a product that would be highly useful as manure. The remedies for such an evil will cover a wide field of investigation, and in pursuing it we must be careful of loose generalities, and exceedingly cautious in the acceptance of statements made by the promoters of pet schemes or the inventors of patented apparatus. They may be made with all sincerity, but, founded on isolated facts or unscientific data, they will be of little or no value. Our object is not to establish a theory nor to attack or defend a system, but to ascertain the truth; and in this spirit I hope to discuss the question of earth-closets.

These closets challenge public notice as a substitute for the ordinary water-closet, and are simple enough in construction. An earth-closet has a hopper behind, in which a quantity of dry loose earth is placed, and beneath the seat is a movable vessel to receive the deposits, and it is so arranged that on closing the fall-down flap to the seat sufficient of the earth passes down to cover the deposits made, and no further action is required on the part of the person using it than to open and shut the fall-down flap. The principle has been known for about a quarter of a century, and the first that was brought under my notice was the invention of Mr. Ruddick, of Reading, and this comprised all the advantages of the present construction. I tried it for several months, using peat charcoal, as the best deodoriser known to us, and nothing could be more successful so far as its working powers went. I make no exception, therefore, that it will not answer the purpose so far, but that goes a very small way towards making it an article suitable for common use, and in a much more limited degree towards mitigating the evils of bad drainage and imperfect methods of irrigation. Let us follow with patience the inquiry how far the general adoption of earth-closets would remedy the defects of our present system, and, even suppose it to be an improvement, whether it is really the best method within our reach.

First, it is generally conceded, except by its most sanguine promoters, that its use is not applicable to cities, and for this reason, that the earth to supply it would have to be carted in from the country, and the accumulated refuse taken away by the same means. What would this involve as a mere matter of expense, supposing that it was done upon a system similar to that which the vestries and local boards of the metropolis adopt for collecting dust and other refuse? It would always have to be kept apart from the other dry refuse of a dwelling, and, therefore, an independent machinery would be necessary for this purpose. Suppose this machinery to exist and that we have carried out to the suburbs this refuse, what have we then got to repay us for the outlay? We have simply got the human excreta solid and fluid, the least valuable of the refuse of a dwelling for agricultural purposes. There is no intention that such a closet should do more than substitute the water-closet; thus the valuable liquid refuse, containing the alkalies and salts which are the true fertilisers, are left to run away as now into the drains and main sewers. It saves us nothing in the way of expense, and leaves us after all a very doubtful article—one that I am sure no experienced or scientific farmer or gardener would think it worth the labour of fetching from the common depôt. We are left in the same difficulty as to our rivers and streams, for means will still have to be devised of saving them from the masses of putrifying and decomposing matter which would be carried from the kitchens and bed-rooms of a city along with the rain-waters. It follows, therefore, that the system would do very little towards saving our rivers from pollution or saving the manure that runs into and pollutes them.

We must look at the manipulation required. Whether in town or country, whether it be a house in Pall Mall or a house twenty miles away, the earth for the use of the closet will have to be brought in, and the deposits mixed with earth will have to be taken away. This may appear a slight matter to a gentleman who is intently anxious to carry out a favourite experiment, and who may superintend the matter himself; but we have to deal with a mixed population, whose attention is absorbed by other pursuits, who know nothing of these matters, and who do not expect to be troubled with them. Anyone who has been much engaged in sanitary pursuits will well understand the immense difficulty of getting any proper supervision of appliances in a house. Things are left to all the chances of misuse, neglect, and accident; and when any derangement becomes offensive or inconvenient, then the plumber is sent for, he is scolded for bad work, but employed to put all right, and the matter is forgotten until some other derangement takes place. This ought not to be so, but so it is, and, therefore, the men who have given the most study to the subject of sanitary appliances pay particular attention to the simplicity of construction, to protection from chances of injury or accident, and, above all, to leave the persons using them as little to do as possible. From the very nature of the thing, labour about water-closets is the most offensive and the most difficult to be procured from attendants. An earth-closet in itself may be made as little liable to derangement as a water-closet; but what would happen in the majority of households if the water to supply them had to be placed in a receptacle and the contents had to be emptied every day? It would be impossible to avoid very much annoyance and discomfort, to say nothing of greater evils. And yet we are asked to sanction a system equivalent to this—that of placing dried earth in the hopper and removing the receptacle that receives it, and this daily, for it must not be told to us that the contents might remain longer without becoming offensive. If allowed to remain until decomposition sets in, which would be within twenty hours—and very often decomposition of solid matter has taken place before it leaves the human body—then no kind or amount of earth would prevent the escape of effluvia.

I do not say that if great advantages can be shown as the probable result of the introduction of a new system that this ought to be an objection. We must balance the disadvantages and accept that plan which embraces the fewer; but I hold that there has been nothing offered to us, either in theory or practice, to induce us to exchange the *water* for the *earth* system in closets. I am taking it for granted that our first object ought to be to remove from human habitations, with the least delay, everything of an offensive kind; the next in importance is that of making the refuse of animal life available, as nature intended, for the sustenance of vegetable life.

Is there not a mistake as to the deodorising properties of earth? Properly speaking, what is meant is that it possesses great powers of absorption. When we apply the soil from an earth-closet to newly-dug ground we find no effluvia, but then the action of the sun and air assists the work of assimilation; but when we have this refuse packed up in a box or in a sack ready for transit to a distant place, we have no external agents to act upon it. There has been a theory propounded that the work of assimilation at once begins; but this is not the case, as anyone may prove by placing upon the fire a shovel-full of the mixed excreta and earth. The sense of smell will soon inform him that the foul gases are only held by absorption in the earth. Besides this, urine contains a large amount of ammonia, and no agent is as yet known to science that will fasten this volatile gas. This gas would be gradually escaping and contaminating the atmosphere. If these things be so, what do we gain by using earth? Do we obtain an immunity from foul smells or malaria? I say not.

I have far exceeded my limits. There are many other considerations which, if space can be allowed me, I will embody in another letter.—I am, &c.,

B.

GOSSIP FROM GLASGOW.

(From our Correspondent.)

Nice customs curt'sey to great kings. You and I cannot be confined within the weak list of a country's fashion: we are the makers of manners.—Henry V.

While the beauty of Grecian architecture cannot well be questioned, the apologists of other and more meretricious styles have often argued that it is so fenced about with minutes and modules, intercolumniations and diameters, that it is wholly unsuited for general purposes; that it is too severe and reserved for any liberties to be taken with it, if, indeed, not too pure and good for human nature's daily food; and that in an age of "progress," elasticity, and utilitarianism, it is too retrospective, inflexible, and ideal. Hitherto the Gothic has been deemed the most subservient style, adapting itself with the flexibility of a prime minister to every known and unknown modern purpose, want, and exigency; but it is quite possible to ride a hobby to death, and age seems to be rather withering and custom staling its infinite variety. The great resource of Gothic has been its careless freedom and adaptability, but in at least Glasgow—of all places in the world—there is given to Grecian architecture a no less comprehensive plasticity,

and so the boasted stronghold of its rival has been at last invaded and reduced. It may be said that when Grecian architecture becomes thus mobile it ceases to be Grecian. As well say that English literature ceased to be English when Samuel Johnson or Charles Dickens varied the manner of its composition, or that Shakspeare's "Henry V." cannot be called a "drama," because that the first scene is in England and the last in France, and that the events of weeks and months are represented in as many hours. The criticism that can find Grecian architecture in only such precedents as the Parthenon or the Erectheon is about as petty as that which would circumscribe the English drama by the paltry pedantry of "the unities." If, despite the matter-of-factism of science, there is beauty inherent and associative in the commonest thing in nature, why should there not be also in the commonest thing in art? If in Greek literature there are the odes of Anacreon as well as the epic of Homer, why should Greek architecture so resolutely refuse to be dissociated from the temples of the Acropolis? "As circumstances alter, things themselves must alter," and the question seems to be, If the Greeks had had to design for such multifarious society as is ours—to clothe our naked and barefaced utilities with the true and the beautiful—in what spirit would they have done it? Would the grace of the Corinthian column not be thrown over the factory stalk? would not the leaf of the acanthus lead to the flowered muslin of the warehouse? It may be pleaded, perhaps, that Greek art is "dead," as is the language. Latin is also dead, yet Roman eloquence was revived by Shakspeare's Marc Antony. I suspect that those who argue thus of Greek art are those who do not know how to revive it, who have merely looked at the letter, not drunk in the spirit—made rhetoricians not born poets, and whose first care in "poetry" would be a foot-rule of trochees and dactyles. But the dramatic Samson was not to be bound by the withes of "the unities," nor is genius to be tied up and trammelled with red tape, measuring ditto, precedents, and glossaries. While it has all due respect for laws and canons, it knows also the when and the wherefore to cast them behind it. Gothic is free as the wild Indian is free; but Greek is free under order and government—order and government founded not upon laws, which are mere arbitrary contrivances, but upon principles which are innate, unvarying, and eternal. Whatever modification it assumes there must reign over all, proportion, symmetry, breadth, and unity; and to restrain new forms within these old conditions requires a no less severe judgment than fertile fancy—two qualities that do not always dwell in the same house.

I have hinted that in commercial Glasgow (as a "modern Athens"), Grecian architecture has been showing new forms in the old spirit, putting, as it were, new wine into old bottles; and I need scarcely say now, in even a London publication, that the author of this peculiar modification is Alexander Thomson. The latest instance of Mr. Thomson's adaptation of Greek to modern purposes is a building intended for a warehouse erected in one of our most fashionable and withal most varied thoroughfares, Sauchiehall-street, and having a return elevation to Scott-street. Of the shop storey little can be either made or said; suffice it, that it has been treated with that simplicity which, where a paramount condition is the greatest amount of void and the least of solid, can alone give "architecturesqueness." The central doorway leading to the premises above is, however, an imposing feature, and brings down to the simplicity of this storey something of the character and expression of the upper and more original parts of the building. Towards Sauchiehall-street, above the shop storey, is a range of thirteen windows, each having a broad architrave relieved by only a single fillet, and a cornice like to the curved cornice of the Egyptians, enriched with an incised honeysuckle-and-lotus. The upper part of this cornice is weathered as a sort of roof, and on the apex is a plinth pedestal supporting an acroterion. Beyond these windows is, at each end, a more solid piece of masonry pierced by only a two-light window having the same architrave as the others, a mullion with moulded base, and an ornamental capital, a dwarf frieze with incised ornamentation, trusses, and a remarkably severe and simple cornice. Upon the plane of these more massive ends, carried along the building, the thirteen windows seem to be superimposed; and at the level of the plinth of the acroteria, this plane is receded or stepped back, and the upper storey is thence resolved into a colonnade. The lowest third of the column is bevelled out of the square into the octagon; this again graduates into the circular, and the shaft, which has an unusually great inclination, terminates in a wide-spreading circular capital. Almost the whole of the column, from the square to the abacus, is covered with incised ornamentation. At the line where the circular part of the column grows out of the octagonal is a moulded dado abutting against the shaft, and upon this rests the sashing of the upper windows, which is so contrived as to give the effect of full relief to the colonnade. The putting in of these sashes—trifling as it may seem—gave to the building throughout a new expression, as if by a touch of magic. There is a great deal of subtle ingenuity in the way in which the colonnade rises from out of the solids between the lower windows—an idea which Mr. Thomson has before realised in his own and brother's magnificent property in Gordon-street, and in a building in Bath-street, and which I regret, however much I may appreciate, I cannot describe. The upper storey of the ends is pierced by three distinct windows, the piers dividing and enclosing them being on the same plane as the general masonry, and having simply outlined but enriched capitals. Stretching over all—these piers and the colonnade—is a grand unbroken entablature of such an original composition that to describe it would require a new nomenclature. Above this is a blocking, which, over the ends, is resolved into a sort of attic of two dwarf piers, and an entablature with raking cornice crowned with an acroterion. Towards Scott-street the storey above shops is composed of five windows with architraves, frieze, trusses, and cornice, and very considerable solids between them; and the upper storey of a colonnade of twelve square piers treated in the same manner as those of ends in the front elevation. The blocking over the entablature is broken up into eight square plinths or dies, on each of which is a chimney having something of the effect of a dwarf column. Throughout this remarkable building is that exquisite beauty of detail in alike ornamentation and contour of mouldings in which, in at least Scotland, Thomson is wholly unrivalled. Grecian architecture rejoices in the sunshine, and this building fortunately faces the south.

WHAT IS AN ARCHITECT?*

In Doctor Johnson's somewhat ponderous romance "Rasselas" it is related how the unhappy prince in the happy valley, in the course of his inquiries into all things human and divine, "foregathered," as our Scotch friends would phrase it, with one Imlac, who had at one time taken up the trade of poetry, and in the course of conversation proceeded to enumerate all the qualifications necessary for the office. "To a poet," he said, "nothing can be useless. Whatever is beautiful and whatever is dreadful must be familiar to his imagination; he must be conversant with all that is awfully vast or elegantly little. . . . But the knowledge of nature is only half the task of the poet; he must be acquainted likewise with all the modes of life. His character requires that he estimate the happiness and misery of every condition, and observe the power of all the passions in all their combinations. . . . He must divest himself of the prejudices of his age and country; he must consider right and wrong in their abstracted and invariable state; . . . he must write as the interpreter of nature and the legislator of mankind. . . . His labour is not yet at an end; he must know many languages and many sciences, and, that his style may be worthy of his thoughts, must, by incessant practice, familiarize to himself every delicacy of speech and grace of harmony." "Enough!" said the prince, interrupting him; "thou hast convinced me that no human being can ever be a poet." "To be a poet," said Imlac, "is indeed very difficult." "So difficult," returned the prince, "that I will at present hear no more of his labours."

With the alteration of a word or two here and there, the above passage would stand pretty well for a general description of what is expected nowadays of persons calling themselves architects. He who has taken upon him this calling will find that nothing is too high or too low for his consideration. He must be acquainted with the history and characteristics of all previous styles, and have a certain amount of ethnological knowledge, combined with an insight into the details of joinery and plastering, and an acquaintance with the various tricks of the building trades; he must be able to design a group of sculpture and to pronounce on the causes of a smell coming from the scullery sink; he may be called upon to raise a church spire or to descend into the uttermost parts of the kitchen boiler; he should be acquainted with the prices and quality of bricks and the principles of geology; a knowledge of mechanical statics and dynamics seems indispensable, as also a familiarity with the requirements of a greenhouse; he will of course be an expert water-colour artist, as well as an adept at making a survey of dilapidations, and he will with equal facility design a stained glass window or give instructions for the amelioration of a smoky chimney. In short, if it were possible to enumerate in one paper all the various subjects upon which architects are constantly consulted, and with which they are expected to be perfectly conversant, it would indeed appear that no human being could possibly be an architect.

Not of course that it is intended to assert that any one man in the profession is sufficiently insane either to think that he understands all these various subjects himself, or to endeavour to persuade his clients that he does. There is a limit both to human self-conceit and to human credulity. But the fact that such an impossible number of subjects may be supposed to come under the head of one profession, and that there is no fixed standard or boundary of architectural knowledge and practice, naturally leads to a great variety of opinions as to what is the real primary and essential element of the profession—the only rule of conduct being that each person generally thinks that the essential branch in which he is himself the most proficient, or for which he has the greatest natural inclination. This is a weakness inherent in human nature, and must be looked upon tenderly, though its results are, it must be confessed, somewhat puzzling; and it may be worth while to glance at some of the principal shades of opinion current as to what constitutes an architect, if, peradventure, by clearing some of them out of the way, we may be able to get a better view of the actual essence of an architect, and see wherein his calling consists.

An opinion which was formerly almost universal, and which still lingers amongst us, is that an architect is a man who draws plans of houses suited to the wants and purse of his client, looks after the interest of said client, keeps an eye on the doings of the joiners and plumbers, goes through the accounts and cuts down the extra bills, and in short acts generally as a sort of bridge over the great gulf which is fixed between the refined and aristocratic client and the gross building element, and for these good services pockets five per cent., besides pickings. It is matter for congratulation that this specimen is likely soon to vanish, like the dodo, into the limbo of forgotten things; indeed, it is known that even in the instances in which it is still to be found, it has generally been thought necessary to import a little fine art into the outer office, in the shape of a draftsman, who may be cunning to devise ornaments and elevations, while his employer, in the *sanctum sanctorum*, improves the shining hour in the more congenial occupation of letter-writing and arbitration, or administering soft soap to his clients. But although this type is passing away, "the evil that men do lives after them," and it is probably mainly owing to the long prevalence of the above-named view of the profession that the architect who takes a higher view thereof is so constantly exposed to the attacks of respectable people, who wish him to look at their ovens, to poke his nose into their drains, and to tell them why the shower bath does not act properly, in all confidence that this is his proper duty and calling. What that calling really is I have to consider presently, but at least it has not necessarily to do with such things as these; for does it not stand to reason that the manufacturers of grates and cisterns and shower-baths, who are constantly engaged practically about them, must know more of them than a man who lives outside of trade and manufacturing operations, and only knows partially by theory what they are practising every day of their lives? The fact is, that this notion of an architect's business proceeds from the idea that tradesmen will always deal unfairly unless there is an architect to check and oversee them. Now the fact is that the architect cannot check them efficiently, for the simple reason that, in nineteen cases out of twenty, they know much

* Portion of a paper read by H. H. Statham, Jun., before the Liverpool Architectural Society.

rule about the matter than he does; and if there be a foundation for the idea that such a check is necessary, I believe it arises from the fact that as long as you will not trust men they are not likely to be worth trusting, and that contractors and workmen who find a man pretending to overlook and find fault with them about things with which they are much more conversant than he is, are likely to be tempted, out of a mere spirit of retribution, to "chisel" the architect in some way or other. And I really cannot see why such a strong line should be drawn between the honesty of the professional man and the tradesman or labourer, or why it should be supposed that a good workman, if treated honourably, would be any more likely to shuffle over his work or to make a job for himself than the architect. Are "jobs" entirely unknown in our profession?

To go to another extreme, there is a class of architects and art-critics, including some of our cleverest men, who very constantly affirm that the only business worthy of an architect is to design sculpture, and that the building is only a frame to contain sculpture, and is without it perfectly lifeless and expressionless, and unworthy to be classed as a work of art. At first sight it would appear that this amounted merely to a reduction of the number of artistic professions by one, that of architecture being simply merged in sculpture, and disappearing gracefully from the scene, as a superannuated myth. But those who have taken stock at all of the sculptured works from the designs of architects will see that there generally is a difference between these and what passes for sculpture with the leading professors of that art; and that architects' sculpture generally shows remarkably stiff figures and expressionless faces with very large heads, and legs and arms "of the period," before *biceps* and *gastrocnemius* muscles were invented. The simple fact is that to be a good sculptor or designer of the figure on a large scale is of itself an aim which will demand all a man's time, energy, and study, unless he be one of those exceptional geniuses who appear once in three or four centuries; and as some one must contrive and draw the buildings that must be erected to receive the statuary, it is clear that the architect cannot successfully combine the ordinary business of his profession with the acquirement of a really high power of design in sculpture or painting. He who would succeed in this path must give himself entirely to it. Then there is another theory, tending in quite a different direction, but which is gaining ground a good deal in certain quarters, that an architect is in fact only a constructor; or, in other words, that an engineer and an architect are very much the same thing—especially an engineer. That the professions of architect and engineer might be much more closely assimilated than they generally are is probable enough, but what is required is rather that the engineers should know more of architecture than that the architects should be better engineers. The structures erected under the superintendence of architects are generally stable enough; at least, failures are not more common in them than in engineering works, though it may be admitted that the engineers have tougher constructional problems to grapple with. But what are we to say of the engineering structures of the day considered from an artistic point of view? With regard to most if not all of them it must, I fear, be said, that they show either an utter disregard to anything like beauty of appearance or decoration, or else the decoration is attempted in such a manner that it had better have been let alone altogether. The usual engineer's notion of bringing a work under the denomination of "architecture" consists not in emphasizing and ornamenting the various parts of the construction, so as to render the aspect of the work pleasing while not concealing its strength, but rather in masking the whole construction behind a screen of what is supposed to be architectural design, that is to say, an imitation of some features which have belonged to some period of architecture, and are readily laid hold of and copied. Thus an ordinary brick or stone bridge for carrying a railway over a road or brook, which, if simply built in the strongest possible manner, with a pointed arch and deeper ribs of masonry where the principal lines of pressure act upon it, would be a really pleasing object, is turned into a kind of quasi-architectural sham, with pilasters affixed, and a weak and purposeless-looking blocking and cornice on the top. There is, indeed, a kind of engineer's style, unlike anything that was ever seen in architecture, which is most commonly developed in buildings devoted to the purposes of waterworks; it is not easily describable, but once seen can never be forgotten. Then there is again another theory to the effect that all architectural beauty consists in polychromatic decoration, about which some very fine things have been and frequently are written concerning walls "glowing with colour," "suffused with all the tints of the rainbow" ("*throbbing* with colour" is an expression I have seen used), and the advocates of this theory would have us believe, on the evidence of some nearly obliterated appearances of colour on the stones of some of the Greek temples, that the Greeks, after selecting the whitest marble from the quarries of Pentelicus, were at the pains to daub it all over with colour, an opinion which, I think, with Mr. Garbett, is against all common sense, and not to be believed on any amount of circumstantial evidence; indeed, if the most indubitable evidence were produced, it would seem far more probable that the buildings were painted over at a later period of debased taste, just as our own Gothic cathedrals were daubed with whitewash; a circumstance which Macaulay's New Zealander, in writing his history of the architecture of ancient England, might adduce to prove that the mediæval architects abhorred colour and invariably whitewashed their buildings to bring them to a uniform tint.

The first time that my attention was drawn to what I venture to think the exaggerated importance attached to coloured decoration by some of its adherents was on the occasion of the reading of a long and valuable paper on the subject by Mr. Audsley in this room, in 1860. In the course of that paper, after remarking on the singular absence of coloured decoration in the interior of our buildings, and the bad taste which ordinary house decorators generally showed in such things, when they were attempted, he continued, "Why, may I ask, are the architects employed upon what is often the mere shell or foundation for artistic display, and the work taken from their hands when (if they are worthy of their profession) their real office begins? An architect is not a constructionist alone, and more, an architect need not trouble his head about it at all, beyond the dictates of common sense."

I have always borne Mr. Audsley a grudge for that sentence, and determined to have it out with him some time or other; for I think that if the building itself is left to be the mere shell for artistic display, that then in that case the architect certainly has not been "worthy of his profession:" and this brings me to the real point, *what*, after all, is his profession. If we deny that he is a mere housebuilder and inspector of workmen; if we will not allow him to be merely a decorator; if he is not, as Mr. Audsley truly said, a constructionist alone, and if we cannot admit him to be a designer of sculpture, what ground is there left for him? Simply this—he is a *Building Artist*. It is his office to use stone, brick, and timber, as the painter uses colour and the musician uses sounds; though the analogy with music is the truer one, because both the arts are alike in having no definite expression, or, as it is the fashion to call it, no *phonetic* power—they can appeal to the imagination or feeling, but not to the reason. And if this view of architecture seems at first sight a dry and uninteresting one, after so many writers in the present day have been endeavouring to impress upon us that we are (or ought to be) painters, sculptors, and what not that is grand and exciting to our imaginations, I think a little consideration will show that architecture pure, as the art simply of building well, has high claims enough upon our interest. For it is the special privilege of the architect to turn that which would be a mere utilitarian necessity into a source of pleasure, by, in the first place, arranging the plan of his building so as not merely to afford convenience and economy of space, but to be effective in its disposition and arrangement, and in the second place, by the arrangement and grouping of the windows and of the various masses of building, and by the effects of shadow carefully studied and considered, to see that the building gives some positive pleasure and interest to those who behold it, in recompense for the amount of light and air that it shuts out, so that, instead of being a mere nuisance and excrescence, it should be an object conveying a definite meaning and expression; and, finally, by the judicious application of well-studied ornamental detail where it may help to emphasize and bring out the expression of the building without being too obtrusively prominent, to give the last touch of refinement and point to the design. And I cannot but think that this treatment of a building in the mass is as much entitled to be called a separate art as that of painting, sculpture, or music, though under somewhat different conditions: I believe it is a source of beauty quite complete in itself, and whose place cannot be filled or supplied by anything else, and that we are therefore fully justified in thinking that the architecturesque employment (to use Professor Kerr's new word) of the ordinary durable building materials of stone and timber is the real duty of the architect, and is to be regarded as of more importance than the designing of coloured detail in more fleeting and perishable material for the decoration of the interior. If the architect tries to be a sculptor, the sculptor can beat him; if he would shine as a constructor the engineers can commonly beat him; but in his own line as indicated above, he is doing what no artist of any other profession can do for us, and furnishing an important link in the chain of art. And it is certainly desirable at present that we should insist upon this view of the building art as a thing existing distinct from and in addition to the other generally recognised branches of art, for it is only thus that we can rebut the theory which has been of late years so noisily propounded in certain quarters, that there is really no defined profession or art of architecture, and that anyone who knows how to construct a building has a right to call himself an architect.

SCARISBRICK HALL, LANCASHIRE.

A FEW weeks since (Building News, No. 683), when speaking of what Mr. Gladstone said of this tower, we promised to give an illustration of it, a promise we now perform. It will be remembered that Mr. Gladstone said that he thought it impossible not to recognise the Scarisbrick tower and the clock tower of the Houses of Parliament, only he thought that Scarisbrick tower was the most beautiful and living work. It certainly does not require a very powerful imagination to trace the origin of the two towers to the same author. Scarisbrick Hall is the seat of Lady Scarisbrick, and was commenced in 1837 from the design of the late A. Welby Pugin. The late possessor, Mr. Charles Scarisbrick, insisted upon retaining some portion of the original house and the whole of the old foundations—the confined limits of which have necessitated the erection of a north-eastern wing, 170ft. in length, which is entirely hidden in the south-west view which we give to-day.

The main building is erected of Lonridge and Scarisbrick stone, which has preserved its arris as sharp as the day the mouldings were cut, thirty years ago, not the least sign of decay having appeared in any part. The fittings are of a very splendid and costly description, the doors, shutters, &c., being richly inlaid with monograms, arms, and other decorations. The ceilings are also worthy of especial notice. The arches and jambs are executed in Carrara statuary and Derbyshire black marble.

The great hall is entirely lined with ancient Belgian carvings of the fifteenth century; and, although only a remnant of those left by Mr. Charles Scarisbrick, forms still one of the finest collections of the kind in the country. The whole of the interior has been executed since Lady Scarisbrick came into possession of the property, and has been carried out under Mr. E. Welby Pugin's direction by Messrs. Hardman, Crace, Farmer, &c., and local workmen. The cost of the entire work, including the offices, which are on an extensive scale, amounts to about £85,000.

NEW FONTS.

WE give this week engravings of two fonts executed by R. L. Boulton, Cheltenham. The first is placed in the Catholic Church, Jarrett-street (not Lamb-street, as written by the engraver), Hull. The second is for Cleanwell Church, Gloucester. The last-mentioned is in Caen stone, with granite shafts, having the eight panels carved in bold relief, from the designs of Mr. J. Middleton, Cheltenham, the architect of the church. It was erected at the expense of the Countess of Dunraven.

The voluntary examination of students by the Institute of British Architects will take place in the third week of next month.

Scarisbrick Hall, Lancashire.

PROGRESS IN PERSIA.

THE ferment for progress has spread from Turkey to Persia, and will very likely make greater way in the latter country. A short line of suburban railway from Teheran, as a trial, has been conceded, and the arrangements are being made by a few Englishmen and Germans. The most striking event, however, is the decision of the Shah to enlarge Teheran, the capital, which has hitherto been remarkable for narrow, ill-paved, and unhealthy streets, shut in by the ramparts. The contrast is the more striking because Rhai and the villages in the neighbourhood are laid out with wide streets, planted with trees, and irrigated. The approach to Teheran is very good, and the palace of the Shahs, belted in with sycamore, produces a fine effect. The Shah has given orders to pull down the present ramparts, and that the new walls shall be a mile and a half distant. Thus the circuit of the city will be greatly enlarged. As in Vienna, under like circumstances, a circular street or boulevard, a Ring strasse, will be formed on the site of the old fortifications, and be a great ornament to the city. As far as possible the old streets will be enlarged, so as to let light and air into the unseemly city, but the best relief will be given by building fresh quarters within the new bounds, the streets of which are to be laid out on the same principles as those of Constantinople, straight, wide, and paved, so as to obtain better security against fire. As Teheran is situated in a plain, the enterprise can be the more readily carried out. Its execution has been entrusted to M. Buhler, a French officer, who has been fifteen years in the Shah's employment, and who is said to have all the qualifications for the task. The plans were put in hand at once.

SCHOOLS OF ART OF EPHESUS.

ON Thursday, the 16th, Mr. Hyde Clarke read before the Society for the Encouragement of the Fine Arts, at Conduit-street, a paper on "The Schools of Art at Ephesus."

Mr. Clarke stated that in his opinion the neighbourhood of Ephesus presented the appearances of pre-historic occupation. Graves and remains had been found on the railway below the recent formations, but had not been properly examined. The cliffs west of Ephesus are particularly deserving of investigation, as they are of the class in which rock-cut pictures are found, as in the case of the Lydo-Assyrian figure of the pseudo-Sesostris at Nymphi. Although he had never discovered anything satisfactory in this way near Ephesus, he did not consider the subject exhausted, for though he was more inclined to look for the other pseudo-Sesostris nearer Smyrna, yet it might have been placed nearer Ephesus, as Herodotus spoke of it as being on the road from Ephesus to Phocæa. He had discovered a curious rock-cut watching place and cistern on the ridge of Messogis, going from Chirkinjee towards the village he founded at Azizieh. He likewise called attention to the numerous caves, as that called of St. John, found in 1863, and the cave church on the road to Chirkinjee, which he regarded as having been formerly a temple or oracle. The floors of these caves, if properly examined, will most likely be found rich in pre-historic remains, throwing great light on the early condition of this part of the world.

With regard to the origin of Ephesus, he saw no ground for adopting any of the theories usually formed in books. He was much inclined to think from frequent observation that Ephesus was formed like some other ancient cities from the amalgamation of three villages or towns founded on neighbouring hills, and which may account for the quarters and names of quarters afterwards found. As to the name of Ephesus he noted it as abnormal, and he did not accept the favourite etymologies. It did not appear to belong to the class of Iberian names which he had discovered in Western Asia Minor, showing an Iberian population conformable to that of Spain, and anterior to the Hellenic. Ephesus and the names of the other Amazonian cities were abnormal from both classes, and he was, therefore, inclined at present to consider them as belonging either to the period of alleged nomad invasion, or perhaps to the Lydo-Assyrian period of the rock-cut monuments. The explanation of this was, perhaps, to be sought not in any Semitic influence, but in a dynasty preceding the Semitic invasion of Mesopotamia, and referable possibly to that period indicated as Turanian by the present connection of the Georgian and Tibetan languages, first proposed by Bryan Hodgson, and confirmed by himself.

As yet Ephesus had not been explored or described, notwithstanding the extent of that valuable monograph, the "Ephesus" of Edward Falkener, the architect, who, like Professor Donaldson, was only a few days on the spot. It requires for its due examination the long-continued labours of men of trained ability in explorations, like C. T. Newton or George Dennis. At present the monuments are being destroyed rather than examined.

The neighbourhood of Ephesus, which he had partially explored, and part of which had been examined by Texier, required systematic investigation. Ephesus was evidently surrounded by summer suburbs, or places for villeggiatura, like all these Ionian cities. He had been on most of these sites. That at Eski Azizieh must have had a population of 20,000; but he did not expect any monuments would be found there, at Chirkinji, or at Azizieh, but he thought that below Azizieh, at Boorgas, and in the mountains on that side there was from the existing fragments some promise. Ortygia, Latorea, and the other old names of villages have yet to be identified.

Referring the oldest known period of art to the Lydo-Assyrian, he said that Ephesus in its most flourishing period had been the seat of great schools of architecture, sculpture, painting, and medalling. It was formerly situated in the neighbourhood of two other rich temple cities, Samos and Magnesia-ad-Maandrum, and of Miletus and Tralles. Ephesus had been the birthplace and the residence of many of the most distinguished artists of classic times. According to Pliny, of the sacred buildings enriched with sculpture and ornament of such a description as entitled them to be called most famous, the first was the Temple of Diana at Ephesus, the second the neighbouring Temple of Apollo at Miletus, the third the Temple of Eleusis, and the fourth the Temple of Jupiter Olympius at Athens.

Of the school of architecture least is known—only this, that its great buildings in the Ionic style gave employment to many of the greatest men, and particularly in the several reconstructions of the Great Temple of Diana. Pæonius is by Falkener placed as the architect of the sixth temple. He was architect of the Temple of Apollo at Miletus. The seventh temple is by him assigned to Ktesiphon, of Cnossus, and his son Metagenes. The latter was employed by Pericles on the Temple of Ceres at Elensis. The architect of the eighth temple was Dinocrates, an architect frequently employed by Alexander. He laid out the city of Alexandria, and his projects included one for converting Mount Athos into a statue of Alexander, and another for suspending the statue of Arsinoe in a temple of loadstone. The name of Dinocrates is variously given. Rhœkus was a sculptor and architect, and father of Theodorus the architect.

Demokritus, Ktesiphon, and Metagenes wrote on architecture. Falkener, "Ephesus," p. 132, quotes the following curious and ancient Ephesian law as to architects: When an architect received the care of a public work, he assured what would be the future cost, and was obliged to deliver up his property to a magistrate as a security till the work should be completed. If the expense then corresponded to the estimate, he was rewarded with decrees and honours, and if it did not exceed one-fourth part in addition, it was defrayed by the public, and no punishment inflicted; but if it exceeded that sum, his property was made use of to complete the works. Twenty-five per cent. was assuredly a liberal margin.

The school of sculpture embraced the greatest names. Rhœkus, and two or three sculptors named Hegesias, are known to have been natives of Ephesus. The most ancient work of art that bears the artist's name engraved on it, is the Gladiator, by Hegesias, in the Borghese collection. Among those recorded as having practised there, are Phidias, Praxiteles, Polyclytus, Skopas, Thrason, Myron, Ktesilaus, Kydon, Heraklides, Mentor, Pharax, Phradmon, Menestratus, Euphranor, Klesis, Posidonius, Strongylion, and Messalinus.

A celebrated select competition was for the statues of the Amazons for the Great Temple. The artists themselves were made judges, "when it appeared that he was the best whom everyone esteemed next to himself." The best then was Polycletus, whose Amazon is supposed to have been holding a bow, from the many copies of it which are now found. The next to him was Phidias, whose statue stood leaning on a lance; the third, Ktesiphon; the fourth, Kydon; the fifth, Phradmon; and the sixth, Strongylion, whose statue was celebrated for the beauty of the legs.

Rhœkus executed, for the Great Temple, an image of a female, called by the Ephesians "Night."

Theodorus, the son of Rhœkus, is said to have carved half a statue of Apollo at Ephesus, the other half of which was executed at Samos by his brother (Pausanias, x. 38), Telekles, who was the father of another Theodorus.

There were works of Skopas in the temples at Ortygia, among others Latona with a sceptre, and Ortygia near her bearing the two children. (Strabo, p. 639).

Among the public statues were those of the Lacedemonian Commanders Lysander, Etronikus, and Pharax, and of the Athenians, Konon and Timotheus.

The Temple of Apollo contained a colossal statue of the god, supposed to be by Myron. This is thought to have been the statue of Apollo which was taken away by Antony and restored by Augustus, who was warned to do so in a dream (Falkener, 110).

Behind the Temple of Hekate stood a famous statue of the goddess Hekate of Ephesus, the patroness of the magicians of the city. It was by Menestratus, and of such splendour that the priests had to warn those who entered to shield their eyes from being injured by it.

One of the last works mentioned is of the Roman time, when the citizens of Ephesus erected a golden statue in the Temple of Diana, in honour of Artemidorus, who obtained the restoration of some of the domains of the temple (Strabo, p. 642).

The Temple of Diana, according to Pliny, was full of sculpture, almost all by Praxiteles. He was also shown some works by Thrason, and said that the statues alone of the temple would afford materials for many volumes.

Thrason likewise executed the Hekatesium, the Fountain Penelope, and the old Eurykleа.

Mentor executed the statue of Diana Ephesia, the tools for working which were hung up in her temple. The same compliment was paid to him in the Temple of Jupiter Capitolinus. He executed also silver vases.

In the Temple of Diana was a statue of Philip of Macedon, destroyed by the mob in the time of Alexander.

An iron Cupid was dedicated in the temple, and appeared suspended, as if without any other support than magnetism.

Hipponax was a distinguished poet of Ephesus, of such strong satire that he was obliged to flee from his native town; whereupon two sculptors set up an image of him, in which they overdid his naturally deformed appearance, but they were so severely satirised by the poet that they hanged themselves in despair.

Trajan presented doors to the temple, which exhibited the Battles of the Giants—Jupiter with his thunderbolts, Neptune with his trident, Apollo with his arrows, and in the lower part the giants fighting with dragons, throwing rocks with their hands, and looking up with maddened eyes.

Of the school of painting more is known. Evenor, called the Prince of Painters, flourished here. He was succeeded by his son and pupil, Parrhasius, who styled himself the King of Painters, and wore a crown of gold and robe of purple. Apelles was also a native of Ephesus. Among the artists connected with the school of Ephesus were Zeuxis, Idæus, Ephorus, the master of Apelles, Theodorus, Ktesikles, Timarete, a female artist, Timanthes, Nikias, Euphranor, Kalliphon, of Samos. Parrhasius and Apelles wrote on painting, so that, with their own and other writings on architecture, Ephesus had a library of art.

Zeuxis and Parrhasius had here their famous contest, in which the grapes of Zeuxis were plucked at by a bird, but, as Zeuxis owned, Parrhasius went beyond, for, as he said, "Zeuxis has beguiled birds, but Parrhasius, Zeuxis." Zeuxis is said to have died from having painted the portrait of a funny old woman, the look of

which was so laughable that he laughed himself to death. Parrhasius greatly contributed to the Temple.

Apelles, who flourished in the next generation, was much more modest, and he would only put his name to three pictures. He painted the portrait of Alexander the Great holding a thunderbolt in the Temple of Diana, for which he received twenty talents, or £3,875. The fingers seemed to stand out, and the thunderbolt to be outside the painting. All these works were executed in four colours only. It was said of this picture that there were two Alexanders—the one begotten of Philip, and he was invincible, and the other painted by Apelles, and he was inimitable.

Arrian says that when Alexander had this portrait taken by Apelles, and came to look at it, he did not praise it so much as the picture deserved, but on his horse being brought in, it began to neigh at the horse represented in the painting as if it also was a real one: "It is clear, O King!" said Apelles, "your horse is a better judge of painting than you are." Cicero speaks of the painting as the most valuable object in the Temple, from which it was stolen by the infamous Verres. Apelles painted Diana in the midst of a choir of virgins; Megabyzus, the high priest of Diana Ephesia, in his state robes; and Klitus on horseback, equipped for war, and asking for his helmet, presented to him by an attendant. It was at Ephesus the incident of "Ne sutor ultra crepidam" took place.

Nikias, pupil of Antidotus, executed the painting of the Sepulchre of Megabyzus.

Timarete, the daughter of Nikon, painted a Diana for the Temple, which in the time of Pliny was one of the oldest panel paintings known.

Kalliphon, of Samos, had two fine paintings in the Temple, one described as Discord raising the battle at the ships of the Greeks, and the other supposed to be women binding on the armour of Patrocles.

Ktesikles, a painter, not receiving from Queen Stratonike such a reception as he considered himself entitled to, painted her romping with a fisherman, for whom, according to common report, she had a strong liking. After showing this picture in the harbour of Ephesus, he at once set sail and got off. The queen would not, however, allow the removal of the painting, the likeness of the two figures being admirably done. (Pliny, Nat. Hist., xxxv., 40.)

There were likewise at Ephesus schools of medalling, which produced the coins of Ephesus and the neighbouring cities; of silversmiths' work connected with the shrine of Diana, and of which Mentor was a famous master; and of pottery. A large collection of framed photographs of Ephesus and the Seven Churches, contributed by Mr. Alexander Svoboda, reached round the room.

A discussion ensued, in which Mr. Hurlstone, President of the Society of British Architects; the Chairman; Mr. A. A. Fry; and the Rev. H. J. Knapp took part.

CURE FOR CHOLERA.

A NEW remedy for cholera, diarrhœa, and other diseases has been introduced by Dr. Chapman, and is at present attracting the attention of the medical world. It consists in the application of ice in varied quantities to different parts of the spine. On the 1st inst. the *Medical Press and Circular* published a case sent by Dr. Fitzgibbon of choleraic diarrhœa, which, after resisting other treatment, was checked by the application of Chapman's ice bag. Dr. Hackett, physician to the Colonial Hospital at Berbice, British Guiana, has also tested it with good results. At a recent meeting of the Surgical Society of Ireland fresh facts were brought forward, which seemed to prove that the new remedy does really exert an appreciable, physiological, and therapeutical action. Dr. J. H. Benson stated that it proved successful in a case of obstinate suppression of the menses, and had greatly benefited a patient suffering from partial hemiplegia. Dr. Hewitt informed the Society that he had also used it in a case of delirium tremens, and found that it cured the tremors, and produced sleep almost immediately. It is chiefly, however, in its efficacy as a cure for cholera and diarrhœa that we feel interested, and we hope soon to hear of further happy results. The *Medical Press* earnestly advises the profession to test the ice bag as a remedy for diarrhœa, so that if happily a large and varied experience should prove that it is really remedial of this disease, it may afford strong hope that we may find in it a most potent remedy for cholera itself.

SCIENTIFIC LECTURES FOR THE PEOPLE.

A SERIES of lectures in connection with Mr. Twining's Economic Museum at Twickenham, for the instruction of the poorer working classes in elementary science, and its applications to health and every day life, has been in course of delivery in various parts of London during the autumn and winter, the last for the season having been given at the Mayfair Literary Institute, Hertford-street, Mayfair, on Tuesday evening last. The course consisted of eight lectures, the first being a description of the most elementary notions of matter; the second of the laws of gravitation, and the most elementary principles of mechanics; the third described the phenomena connected with the pressure of air and water (aërostatics and hydrostatics), and of the production and transmission of sound (acoustics); the fourth contained some general considerations concerning light, heat, electricity, and magnetism (chemical physics); the fifth was upon elementary chemistry; and the sixth, seventh, and eighth were upon the elementary outlines of natural history, human anatomy, and physiology. Scientific lectures, except in the classes of elementary schools, generally presuppose some slight acquaintance on the part of the audience with the fundamental principles involved, or, at least, with the usual nomenclature. It being, however, Mr. Twining's aim to bring a certain amount of this knowledge within the reach of those who are perfectly uninstructed in the matter, he has prepared his lectures in the clearest and most simple language, taking care to define and illustrate every technical term, however common it may be, before using it. The illustrations, consisting of diagrams, specimens, models, and experiments, are all likewise of the simplest kind. The lectures are provided gratuitously in all respects by Mr. Twining, and have been delivered two or three times every week (holiday times excepted) to audiences varying from one or two hundred up to about a thousand persons, at school-rooms, literary institutions, workmen's clubs, mission rooms, and at the Lambeth Baths. They have been clearly and effectively read by Mr. William Freeman, curator of the Twickenham Economic Museum, the experiments being performed and the illustrations exhibited accurately and satisfactorily by Mr. George Whipple, of the Royal Kew Observatory. This attempt to bring elementary science within the reach of the poorest and most uninstructed will be highly appreciated by all sanitary reformers, who find their greatest obstacle in dealing with the poor themselves to be their complete ignorance of the most elementary laws of science and health.

ARCHÆOLOGY.

From Rome we have an account of some very valuable art discoveries that have recently been made there. The excavations in progress are producing the most interesting historical results, and bringing to light a large number of the ancient masterpieces of art with which the holy city was formerly embellished. Two flights of steps which led from the river have been cleared, and two passages have been discovered which gave direct access to the interior of the adjoining market. At the depôt of marbles on the banks of the Tiber was also found a large staircase with sculptured ornaments, in a position exactly corresponding with the previsions of the learned director of the works. Up to the present time there have been found 111 blocks of African marble, 240 of antique yellow, and as many of serpentine. Other varieties are met with in smaller quantities, such as antique red and green, breccio, and even Chalcedonian. At Ostia, where the researches are being made by a commission of antiquarians, some remarkable monuments have been found throwing a new light on the worship of Cybele in that place. Among other things there is a series of votive offerings in the ground consecrated to that goddess. In the same place was discovered the remains of a temple, destined for initiatory ceremonies, and which forms an edifice quite unique of its kind; also a house very elegantly decorated, and on the walls of which was a fresco representing a festival sacred to Diana. This painting is of extreme delicacy of execution.

About 100 old coins of the coinage of the reigns of Elizabeth, James, and Charles I., were discovered recently in connection with certain extensive building operations on the south side of Trongate, near Glasgow. Some of the coins were English and the remainder Scotch.

An interesting discovery has been made at Berwick within the last few days, while trenching ground for a garden at a recently-erected villa, on the Corporation property. The gardener, being compelled to go deep, came upon the skeletons of several human beings. They were in different parts of the ground. On each side of three of the bodies were slabs of undressed stone, with rude stone coverings. On one was an incised cross, with a rose in the centre; and on another, the cist of a child, was a Latin cross. At another part of the ground there was discovered a tower-like structure, in front of which is a wall 4ft. thick, and running in a transverse direction into a portion of the adjoining land. Permission was obtained to trace the wall into the adjoining land, and it has been ascertained that the wall is 94ft. long, by 43ft. in width; the solid masonry is 23ft. square, and between the wall and the building is a space of 20ft. From a small piece of architectural moulding which was found, it is presumed that the building belonged to the Norman period.

There has just been discovered at Pompeii the impression of a papyrus, the characters of which are perfectly legible. This result is of importance, from the fact that no traces of any had been hitherto found in the excavations near Naples, although many were discovered at Herculaneum.

At a recent meeting of the Archæological Institute, Mr. E. Smirke in the chair, Mr. Tregellas gave a short account of "Simpson's Moat," a fortified house of the fifteenth century, near Bromley, Kent, about to be destroyed under the operations of a building society. The house had been acquired by Nicholas Simpson, barber to Henry the Eighth, and by him much improved. From him also it took the name by which it has ever since been known. It since came into the possession of the Langley family, who held it down to modern times; but it had been unoccupied for half a century. A slight sketch of the principal existing remains, together with a ground plan, were shown.

A discovery, which a Scotch paper thinks will give rise to much speculation and investigation among antiquarians, has just been made on the property of Mr. Cadell, of Grange, Edinburgh. In the course of some improvements in the garden, the workmen turned up a large stone, which at first was thrown aside as an ordinary boulder, and for a time was allowed to lie on the surface. An examination afterwards made, however, showed that the reverse of the stone contained an inscription which seemed to identify it with the wall of Antonius (commonly known in that quarter as "Graham's Dyke"), built during the Roman occupation of Lollius Urbicus, for the purpose of shutting off the wild tribes to the north, and which was supposed to extend from the Forth to the Clyde. From the inscription it is conjectured that this stone was intended to commemorate the finishing of the wall; and, if so, it will prove a valuable aid to antiquarian research, as showing how far the work actually did extend eastward.

WATER SUPPLY AND SANITARY MATTERS.

The first section of the new sewerage works at Dartmouth has been commenced, though slow progress for the present is being made, as the men are only able to work "tide work," owing to the water at high tides filling the cutting in Duke-street. The contractors for the work are Messrs. Call and Pethick, Plymouth. The Town Council has decided on using culvert instead of stave pipes as at first proposed.

Mr. J. Bailey Denton says that those who have observed the character and amount of the rainfall of the past winter, and are watching its effect upon our rivers and springs, will feel themselves justified in predicting a reduced summer supply of water for domestic use. As this occurrence may be adduced as proof of the insufficiency of the Thames and its tributaries as sources of supply to the metropolis, and may, when discovered, hasten the issue of the report of the Water Supply Commission, he desires to anticipate both circumstances by again urging the storage of surplus water.

The sanitary condition of Manchester has long been a matter of anxiety to the local authorities. At a meeting of the sanitary association, held on Friday, the mayor remarked that among the causes which contribute to produce this unsatisfactory state of things, not the least serious was the want of proper hospital accommodation for patients suffering from fever and other infectious diseases. In the opinion of the newly-appointed officer of health, this was a want which must be supplied before they could hope to make any impression of consequence upon the death rate. What is proposed, therefore, is that immediate steps should be taken for the establishment of hospitals, where persons labouring under infectious diseases might be placed under more favourable hygienic conditions. It is hoped that the scheme may be carried out by voluntary subscriptions.

The opening of the Liberton Waterworks for the use of the inhabitants of the villages of Liberton and Greenend, N.B., took place on Wednesday. They were commenced on the 15th of January last, and a supply of 30,000 gallons daily is now available. The supply bids fair to be both abundant and permanent. The works have been completed within the stipulated time, under the superintendence of Mr. A. D. Stewart, C.E.; the contractors being Messrs. Chalmers and Mackenzie, of Dunfermline. Mr. Kay, Loanhead, executed the plumber work.

Building Intelligence.

CHURCHES AND CHAPELS.

St. Mark's Church, North Audley-street, which was built forty years ago by Mr. Gandy (Deering), and has been pronounced by high authority to be one of the best specimens we have of pure Greek architecture, has lately been "re-cast," and is a good example of what may be done to improve a galleried church of the kind. Desk obstructions have been removed, so as to open the holy table to the view of the whole congregation.

On Easter Tuesday the parish church of All Saints, Legbourne, Lincolnshire, was reopened after restoration. The church is of the Early Decorated style, and is built partly of sandstone and partly of the chalk of the county. The whole cost of the restoration has been about £2,000. The chancel has been entirely rebuilt. The architects of the church were Messrs. Rogers and Marsden, of Louth.

On Easter Tuesday a new church was opened by the Bishop of Worcester, at Dordon, in the parish of Polesworth. It consists of a nave and chancel with an octagonal bell turret at the west end, and is built of brick with stone dressings. Mr. G. E. Street, A.R.A., is the architect.

The new church of St. Catherine, Gloucester, was consecrated by the Bishop of the diocese on Easter Monday. The style of the building is Early French, and it consists of nave, transepts, and chancel, with circular apse. The nave is 68ft. long and 28ft. wide, the transepts are each 20ft. by 13ft., and the chancel is 22ft. square. The church is built chiefly of Severn-side bricks, relieved outside by bands of black and white Staffordshire bricks, and stone dressings. The church has been erected by Messrs. King and Godwin, builders, from the designs of Mr. H. Medland, architect, of Gloucester.

On Saturday the foundation stone was laid of the new church of St. Peter the Apostle, Swinton. The plans and designs are by Mr. Street. The contract price is £10,000, but before the church is finished, it is expected that half as much more as that sum will be required.

A new Congregational Church at Dalkeith, Scotland, was opened on Sunday. It is from the designs of Mr. J. W. Smith, architect, Edinburgh, and has seat room for 430 persons.

The foundation stone of a new parish church at Kilmoil, County Down, was recently laid by Colonel Forde, M.P. The style is Early French Gothic, and the cost will be £3,000. Mr. Thomas Drew, F.R.I.A.I., is the architect, and Mr. John Murphy, Belfast, the contractor.

The Congregational Church at Bowdon Downs, Lancashire, was reopened on Sunday last after enlargement. The work has been carried out at a cost of about £3,000 from the designs of Mr. Ernest Bates, architect, Manchester.

On Thursday week the corner stone of a new Wesleyan Chapel was laid at St. Helen's, Liverpool. The style of the building is Italian, and it will be in the form of a parallelogram. It will be 95ft. long by 65ft. 9in. wide, and 38ft. 9in. high from the floor to the ceiling. It will be built of Stourton stone and pressed bricks, and will hold 1,200 people. Mr. George Harris, jun., of St. Helen's, is the architect, and Messrs. Harris and Son have taken the contract, for £6,000.

The memorial stone of a new Wesleyan Chapel was laid on Friday week, at Gainsboro'. The building is being built entirely of concrete, and when finished will have the appearance of stone.

The English residents have laid the foundation stone of an English church in Dresden.

On Easter Tuesday, St. Michael's Church, Rushall, was reopened after restoration. The additions include a lengthening of the nave to the extent of 33ft, and the erection of a spire. The work has been done by Mr. Highway, of Rushall, at a cost of £2,000, from the designs of Mr. Cranston, architect, Birmingham.

Wilcote Church, Oxfordshire, was reopened on Easter Day after restoration. The restoration comprises besides a new porch, new roofs, floors, doors, windows, and fittings. The east window has been made somewhat larger and filled with stained glass by Heaton, Butler, and Bayne, the subject being the parable of the good seed. The architect was Mr. A. W. Blomfield.

On Friday last the parish church of St. Lawrence, Snaith, Yorkshire, was reopened after thorough restoration. The church is a large one containing a nave with clerestory and aisles, measuring 94ft. by 60ft., chancel 54ft. by 21ft., and tower 30ft. square outside. The whole church, excepting the tower, has been re-roofed, and the battlements have been rebuilt. The whole cost of the restoration will probably amount to £3,500. The works have been carried out from the designs of B. and William Atkinson, architects, York.

St. James's Church, East Cowes, was reopened on Sunday last after restoration. With the exception of the tower the church is entirely rebuilt from designs furnished by Mr. T. Hellyer, architect, of Ryde.

On Wednesday week the Duchess of Marlborough laid the chief stone of the new church of St. John the Evangelist, at Hailey, in the county of Oxford. The new church will be erected in the early thirteenth century Gothic style, from the designs of Mr. Clapton Rolfe, architect. It will contain 250 sittings, and the estimated cost of the work, including boundaries, is about £2,000.

The parish church of Alton, Hants, was reopened on Thursday week after restoration. The building, which is a good specimen of Norman work, had been sadly neglected. It has been entirely re-pewed, the roof has been stripped of accumulated coats of whitewash, and the timbers varnished. The tower has been utilised as a baptistry. Mr. Christian, of Whitehall-place, was the architect who superintended the work, which was carried out by Mr. Dyer, of Alton.

A small mission school church is shortly to be erected at Sandsend, near Whitby, from designs by Mr. C. Noel Armfield, architect, of Whitby. It will be of middle thirteenth century Gothic of a rural type with low walls and high-pitched roof, and will contain 156 sittings, exclusive of choir and clergy. It will consist of a building of one uniform height, the chancel being defined on the exterior by ridge cresting and wall treatment slightly differing from that of the nave. In the interior the chancel will be strongly marked by a screen, by the arched principal of the roof, and by a polygonal boarded ceiling.

BUILDINGS.

The guardians of the parish of Marylebone have been building some new wards for the aged and infirm inmates of the workhouse; they were opened on Thursday week for a private view. The front faces the quadrangle of what was the able-bodied women's ward. The entire cost has been under £6,400. Mr. Saxon Snell, of Chancery-lane, was the architect. The whole accommodation is for 240 inmates, which gives the rate at a fraction under £27 a bed. The brickwork is all best London stacks, with the old lakehouse and laundry walls used up as fillings, inside courses and partitions.

St. Augustine's Schools, Halifax, erected at a cost of £4,000, were opened on Easter Tuesday.

The foundation stone of the first of the four large new graving docks at Chatham was laid on Tuesday. The new dock is expected to be completed in about two years, by which period the first of the three large basins will likewise be finished.

The subway for water and gas pipes to pass through beneath the new street in course of formation from the corner of Hatton-garden and Holborn-hill, crossing Ely-place, Saffron hill, and Farringdon-road to West Smithfield, near the dead meat and poultry market, is completed, as also the main sewer passing into the Fleet-ditch, and the paving has been commenced. The exterior of the dead meat and poultry market is completed, and workmen are engaged in fitting up the interior.

The Albert Memorial Museum, Exeter, which has been erected at a cost of £12,000, was opened on Monday. In the interior the main architectural feature is the staircase leading from the ground floor. The stairs commence in the centre of the floor, and at the top of the first flight is a niche filled by a statue of Prince Albert, which has been executed by Mr. Stephens, a local sculptor.

The installation of a Poor Classes Convent, which has been erected at Longsight, Lancashire, took place on Thursday week. The building is of the French Gothic style, and has been erected by Mr. Joseph Thompson, of Hulme, from the plans of Mr. W. Nicholson, architect, of this city. Internally, it is in the form of a square, cloisters extending along each side, and apartments—or cells, as they are called—have been erected for the reception of twenty-four nuns and nine lay sisters.

It is now decided that Her Majesty will lay the foundation stone of the new St. Thomas's Hospital on Wednesday, the 13th of May, at half-past eleven o'clock.

On Thursday week the House of Mercy at Great Maplestead, instituted under the management of an Anglican Sisterhood for the Recovery of Fallen Women, was inaugurated by the principal visitor, the Lord Bishop of Rochester. The buildings are from the designs of Mr. Woodyer. The form is a quadrangle. On one side are the dining-hall, class-rooms, kitchen, &c.; and above, dormitories for the penitents and small bedrooms for Sisters overlooking them. On another side are the chapel and infirmary. Round the whole quadrangle runs a covered way or cloister, giving access to the different apartments and affording communication with the whole under shelter. The material is red brick with stone facings and mullions, and all is substantial and solidly executed. The chief attraction is the chapel. Its style is Early English or First Pointed.

MEETINGS FOR THE ENSUING WEEK.

Tues.—Institute of Civil Engineers.—Discussion upon the papers on Irrigation in India and in Spain, 8.

Wed.—Society of Arts.—"On Progress in Oyster Culture," by Harry Lobb, Esq.

Sat.—Associated Arts Institute.—"Notes on Animal Painters," by Frank N. Prince, Esq.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

Notice.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

Received.—H. A.—W. R. H.—T. W—S. and C.—F. G. T. R.—A. W.—J. C. J.—A. L.—T. F. M.—R. K.—R. W.—C. B. A.—S. and Co.—J. R.—I. T. R.—H. S.—W. M. E. W. P.—G. W.—W. S.—E. H. L. B.—J. C. J.—W. S.—I. M. The Pugin v. Barry Controversy.—We have received a long letter from Mr. E. M. Barry on this controversy, and did the letter contain any new point or throw an additional light on the points hitherto advanced we would insert it *in extenso* but it does not. For a similar reason we must decline to insert letters on the same subject from Mr. E. W. Pugin, Mr. Burton, and Mr. Wm. Young.

M.—Consult a dictionary on the pronunciation of the word vase.

B. E. N.—Consult a lawyer.

Correspondence.

ORGANS.

To the Editor of the Building News.

Sir,—I am perfectly aware that Mr. Hopkins in common with many others has expressed his opinion that the quantity of tin in a pipe influences the tone, but I am not aware how far he has practically tested the alleged fact. I have done so, and know it to be merely a vulgar error. It is not long since that all authorities upon bell metal accounted for the silvery ring of old bells by the fact of there being a great deal of silver actually mixed with the bronze, till direct analysis proved the contrary, and that the old stories of Russian nobles and others throwing in their plate as the metal was melting were merely myths. That the old organs differed in quality and quantity of sound from the modern is not to be accounted for by the metal used, for, as I have shown, Father Smith's organ metal at St. Paul's *upon real experiment required more tin to be added before it would spot*, and some of Mr. Schultze's work at Doncaster, which most resembles the old in quality of sound, is of zinc—a metal which on many accounts I should be sorry to see extensively used. All the larger pipes in the Doncaster organ are of that metal.

I really will not waste your space by controverting so absurd a proposition as that Willis's diapasons are wishy-washy. Your correspondent might with just as good sense have said that they were green or salt. If they had been described as heavy, coarse, or noisy, I could have understood the objection, though I should entirely have differed from the verdict. Any other epithet in the whole English vocabulary would have as truly described the tone of Mr. Willis's superb diapasons, which are marvellous for purity and roundness of tone. Mr. "R. T."—which I suppose I am not wrong in translating Richard Tamplin—has given us his opinion that Cavaillé's flue work is light and ineffective. I believe he is quite as wrong in this as in his personal remarks upon Mr. Willis. It is quite true, on the other hand, that Cavaillé has made great improvements in arrangements for steadying the wind. But these improvements are adopted by all respectable builders, most certainly by Willis, who uses his system in all its entirety.

If there is one point more than another characteristic of old diapasons it is their flutiness of tone, and now this very quality is alleged as an imperfection in Willis's As for his pipes being devoid of their proper harmonics, why, it is this very feature of making the harmonics ring out that has been his especial study and has made his reputation—one which, in my opinion, "R. T." is quite incapable of shaking.

In reeds, again, close tight tone is objected to It is, however, the very finest tone that one can desire, only enhanced by Cavaillé's magnificent discovery of the harmonic trumpet. We all know the difference of the ordinary street clarionet and that of one played by such a man as Lazarus. This latter is the quality aimed at. It would be a bad day if we were to give up these "tight unpleasant (?) toned reeds" for such as "R. T." would bring us back to if he could. That Willis's reeds are unequal is not a fact.

If metal composed of half tin or less has a knack of becoming soft, "how is it," says "H. T.," "that the St Paul's pipes have lasted for two hundred years?" The answer to this is plain enough—on account of their immense thickness. Father Smith knew the importance of *weight* over quality.

Mr. "W. T." says "is it likely that such a genius in his art as Father Smith should have used three-fourths of tin for any purpose than sound?" Why not? *If he ever did so*, which was certainly not the case with St. Paul's, he might have done it quite as probably for the sake of greater durability or even for appearance: though whatever may have been his idea, it cannot now alter the well-ascertained fact that the quality of metal does not affect tone—that, in fact, given the same scale, thickness, voicing, &c., a stop might be made of alternate fine metal and type without the keenest ear being able to detect the difference.

But as the value of a judgment upon such matters as the quality of musical sound depends so much upon the capability of and absence of bias in the judge, I refer your readers, in addition to the great names I have already adduced as bearing witness to the excellence of Willis's organs, to the reports of the jurors of the 1851 and 1862 Exhibitions, but more especially to the able criticism of H. J. Oakeley in the *Guardian* in the summer of 1862—H. J. Oakeley being Professor of the University of Edinburgh, and one of the greatest musicians of the present day.—I am, &c, J. C. J.

MANCHESTER TOWNHALL.

Sir,—I quite agree with Mr. Waterhouse in his answer to your article of the 10th inst., that the "one sentence" and "part of another" which he has quoted from the instructions (in the absence of the previous portion of the paragraph) would appear to allow the latitude he has taken in the arrangement of his admirable plan. Yet is it fair to omit quoting the governing portion of the paragraph, which reads thus?—"The townhall is to be built upon the land included within the building lines shown on the plan, beyond which no part of the building, except the grand entrance and steps to the main floor in Albert-square, is to project."

Either the above does not allow Mr. Waterhouse the liberty he has taken, or the committee in its insertion did not know their own intention. For myself, I think the paragraph, which I enclose *in extenso*, is sufficiently free from ambiguity, and its meaning I take for this:—A building line is given, beyond which nothing is to be built. The form of the building inside the building line can be altered to suit the designer's own taste and convenience, as can also the various projecting portions both in Cooper-street and Princess-street, still bearing in mind the original boundary or building line is not to be exceeded. In conclusion, I would say that I have good authority for stating that in the preliminary competition the then professional adjudicator, along with the committee, rejected several designs exhibiting excellent specimens of scientific planning as well as architectural compositions, solely on the ground of their authors having exceeded the instructions. —I am, &c., John Charlesworth.

3, Princess-street, Manchester, April 21.

(Paragraph alluded to)

"*The townhall is to be built upon the land included within the building lines shown on the plan, beyond which no part of the building, except the grand entrance and steps to the main floor in Albert-square, is to project.* Architects are to use their own discretion as to the shape or form of the building, and are not obliged to adhere to the boundary line of the land as shown on the plan. At the same time it must be borne in mind that the extent of accommodation afforded will be an important element in the final decision. The building must occupy the full extent of the frontage in Cooper-street, but the lengths of the various projecting portions and areas in Princess-street and Lloyd street may be altered to suit the design of the competitor."

Sir,—Mr. Waterhouse's letter in your impression last week affords another instance of the elastic manner in which conditions to competitors, drawn up with the intention of being precise and exact, may be interpreted by those who wish to make them serve a particular purpose. Mr. Waterhouse quotes the following sentences:—

"Architects are to use their own discretion as to the shape and form of the building, and are not obliged to adhere to the boundary line of the land as shown on the plan." "The lengths of the various projecting portions and areas in Princess-street and Lloyd-street may be altered to suit the design of the competitor." Why did he not give your readers the sentence which precedes these two, and which runs as follows?—

"The townhall is to be built upon the land included within the building lines shown on the plan, beyond which no part of the building, except the grand entrance and steps to the main floor in Albert square, is to project."

This sentence is the text to the two that follow it, and the whole, when put together, means, if it means anything, that the lines of building marked out on the lithographed plan must not be transgressed or built beyond, and that architects are at liberty to alter the building lines only so long as they keep within them. This is the way in which I construed the paragraph, and it is the only acceptation it will bear when taken altogether. I am further supported in my reading of it by another portion of a sentence which Mr. Waterhouse also omits, where it says that "the building must occupy the full extent of the frontage in Cooper-street.—I am, &c.,

A Competing Architect.

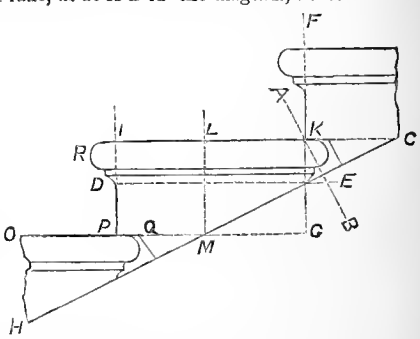
COTTAGE HOSPITAL, VENTNOR.

Sir,—I think those of your readers who intend competing for the proposed National Cottage Hospital for Consumption, Ventnor, ought to be informed that the committee have already their architect, who it is intended shall carry out the successful design whosever it may be; so that the £10 and £5 are all the competitors will probably get for their trouble in furnishing a design.—I am, &c., W. Bosworth.

PROPORTIONS OF STONE SPANDREL STEPS.

Sir,—Those who have had occasion to prepare drawings for stone spandrel steps have doubtless noticed the absence of any definite rule by which to ascertain their thickness in the works of architectural writers on the subject. In default of such a rule I have recently been endeavouring, by the measurement of executed examples, to discover some general standard on which to found a theory of proportion.

By so doing I have obtained the following limitations:—The width across the thinnest part of the step, measured at right angles to the line of rake, as at A B in the diagram, must never be



less than $2\frac{3}{8}$in. or more than 3in. When this width is exceeded there is, I find, a look of clumsiness; and as surveyors measure the step to the extremity of the acute angle, as at C, all unnecessary thickness adds considerably to the cost. Again, it is evident that a thickness of less than $2\frac{3}{8}$in. would be detrimental, not only to the strength, but also to the appearance of the step, for with a nosing of the customary size this dimension is the smallest in which a proper return can be worked clear of the rake.

In trying to found on these measurements a rule for the sizes of steps I was first led, from seeing the important part the return nosing plays, to make the nosing fix the width, *i.e.*, the position of the raking line H C. Thus the intersection of the bottom line of the nosing D E, with the face line of the riser F G, would give the point through which to draw the raking line H C. I abandoned this method, however, as (although otherwise very satisfactory in its results) it depends upon the width of the nosing, which has also not been settled by law. While trying next to get some solution from a subdivision of the riser and tread, I came upon the following construction, which seems to satisfy the conditions for steps of every proportion. Bisect the solid portion of the step I K in L, and from L let fall a perpendicular L M to the face line of the lower tread O P produced towards G. The intersection of these two lines in M gives the point through which to draw the raking line H C.

While on the subject of proportion, I think that it is impossible to have anything better for the relation that the riser should bear to the tread than the well-known rule, that their product, when multiplied together, should be equal to 66. I am not aware that any proportion has been laid down for the nosing. From the examples that I have measured we may assume that its projection R I should be one eighth of the width of the tread I K, and its total depth I D about twice its projection.

The horizontal bearing of one step on the other, as at P Q, should be equal to the projection of the nosing, the raking joint K E being of course at right angles to the line of rake H C.

I should be glad to learn how far the rules thus given agree with the practice of those of your readers who have considered the question.—I am, &c., Gilbert R. Redgrave.

Intercommunication.

QUESTIONS.

[832.]—PAPER-HANGINGS.—Can any of your readers tell me what material is used for the production of the raised, soft-feeling flowers on paper hangings, and how it is applied?—J. GOLD.

[833.]—BUILDING CHIMNEYS.—Will you be so kind as to tell me what you consider the best way to build a chimney about 150ft. high? Should it be a tapering flue, wide at the base and narrow at the top; or should the flue be of one uniform width; or should it be widest at the top? Perhaps you can refer me to some source of information on the point.—EDWIN HALE.

[834.]—DRAWING SCHOOL.—Will you inform me where I can attend (in the evening) a good architectural drawing school, not far away from Kings's Cross?—A STONEMASON.

[We know of none nearer than the Architectural Association, 9, Conduit-street.]

[835.]—GAS-MAKING.—There is an invention by some person now in use for making gas by a small affair, for any house, from a cottage upwards. It is, I believe, self-working. I should be glad if you or any of your correspondents can inform me where it can be had, or who are the inventors and makers of the same. An early reply would confer a favour upon—A. C. E.

[836.]—NEW CEMENT.—Will you, or some of your readers, kindly inform me what mode of mixing should be adopted to form solid masses from sand or other particles mixed with magnesia, slaked with a solution of chloride of magnesium, as mentioned in an article in the BUILDING NEWS, No. 662, page 637, entitled "New Cement and Building Material."—BONA FIDES.

[837.]—WEIGHT OF WATER.—Can any of your readers oblige by informing me what is really the weight of a gallon of water, as I find opinions differ greatly?—CISTERN.

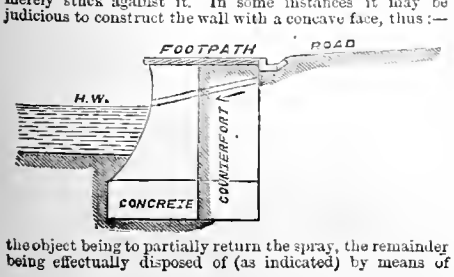
[If "Cistern" wishes to obtain very accurate information upon the subject, let him first weigh an empty imperial gallon measure, then fill it with water, and subtract the weight of the measure from the last. We answer his question by telling him to obtain what he wants, because, if he cannot believe the printed authorities he has seen, why should he believe any fresh ones that he may see in our columns? Besides this, we are putting him in the way of being a practical philosopher. "Cistern" will also find, if he continues his experiments, that the weight alters according to the temperature.]

[838.]—RESPONSIBILITY OF AN ARCHITECT.—If an architect prepares the plans of a building without a specification or any written contract whatever, and his client employs the workmen and supplies all the materials, and verbally engages the architect to superintend the works (there being no specification or written contract), if there should be any fault in the building occasioned through the workmen not doing their work properly, is the architect legally responsible, and can his client compel him to make good the said faults at his own cost?—T. G.

REPLIES.

[800.]—QUANTITIES AND PRICES OF TIMBER.—One part of the queries by "Ignoramus" was not answered last week, *i.e.*, the meaning of duty and drawback. The duty is the amount paid to the Customs when the timber is taken from the docks; and the drawback is the amount allowed and returned by Government if the timber has been used in public works or churches. To obtain the drawback, after the work is finished a form must be obtained from the officer of Inland Revenue acting in the district where the work is fixed, which must be filled in and sent in to the Custom House. The amount of red tape required will be fully shown in the form supplied.—F. R.

[802.]—A SEA WALL.—"Alexander" may glean useful and reliable information on the subject from "Dobson's Art of Building," and "Foundations, &c.," both of Weale's series. The formula laid down for the thickness and batter of retaining walls generally is one fourth of the length for thickness, and one-sixth of ditto for batter; but this rule is, and oft times must be, deviated from, allowance having to be made for the nature of the soil to be supported, and other contingencies. It is a *sine qua non* that the foundation and footings should be level, and the back of the wall perpendicular. A sea wall, if of masonry, should be faced and snugly pointed, thus preventing interstices or irregularities being acted upon by the waves; the coping should be rounded from the face of the wall, and should on no account project beyond. Concrete is often used for sea walls, built up in layers between boards, and finished with a semicircular (self-coped) top. This method has the recommendation of strength if properly constructed, and presents the smooth frontage for tidal action. The foundation in either instance should be placed sufficiently deep to escape being undermined even if the beach should be shifted or washed away: and the wall should be strengthened by counterforts or internal buttresses, at frequent intervals, firmly bonded to as part of the wall, and on no account merely stuck against it. In some instances it may be judicious to construct the wall with a concave face, thus:—



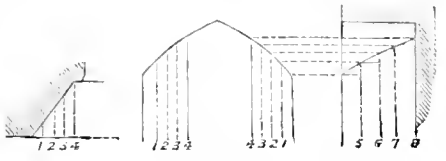
the object being to partially return the spray, the remainder being effectually disposed of (as indicated) by means of surface drainage from the road and sloping footpath, by means of an ordinary channel with frequent outlets. The wall may be protected, and the force of the waves partially destroyed, by the placing of breakers, consisting of piles driven into the beach and connected by planking, at right angles to the wall at convenient intervals; and the immediate foundation of the wall may be further strengthened by rows of sheet piling on the outer face. The proportions of concrete vary from six to three of gravel to one of lime, owing to the difference in quality of the material. Some authorities advocate its being thrown into the trenches from a considerable height whilst hot, and well rammed; whilst others consider these operations to be of very little import.—F.

[810.]—MIXED CEMENT.—In answer to "S. W. M.," good Portland cement used with washed road grit will never separate. It possesses angle binding and strengthening powers for paving steps or blocks. I have proved it to a great extent.—JAMES SAXBY, Guildford Lawn, Ramsgate.

[810.]—Roman and Portland cement should never be mixed, as they do not set with the same rapidity. For external work, Portland cement, with a proper proportion of sand, is by far the most durable material.—F. R.

[811.]—MULBERRY WOOD.—If the mulberry wood is required to match an old piece of furniture it must itself be old and seasoned; and there would be great difficulty in obtaining it. The best plan would be to use a veneer, which could be polished and stained to the colour and face of the old work.—F. R.

[812.]—FLAT SOFFIT FINISHING.—The best way to finish a flat soffit against a splay is to carry up the splay to the highest point of the contact with the soffit, then form the centreing of the soffit against the splay. The exact curve may be found by ordinates, thus:—Set off four equal



Plan of Jamb. Elevation of Jamb and Arch. Section of Soffit.

divisions, 1, 2, 3, 4, in the plan of jamb and elevation of jamb, then set off other four equal divisions, 5, 6, 7, 8, in the section of soffit. The ordinates, 1, 2, 3, 4, being carried across to the section, the junction of 4 with 8, 3 with 7, 2 with 6, and 1 with 5, will give points through which the curve may be drawn.—FOREMAN.

[813.]—BULGING WALL.—To prevent flint walls bulging, and being built without brick piers, they should diminish one-half their thickness from base to top, as there are very little absorbing properties in flint. The stretching courses should be bedded in blue ashes and lime, which will form strong drying mortar for hard bricks; the coping bricks should be bedded in good Portland cement and washed road grit as headers. This is the Flemish bond we seldom practice upon.—JAMES SAXBY, Ramsgate.

[813.]—A flint wall, 20ft. long and 12ft. high, without buttresses or bonding, is not likely to keep straight. The best way to make a sound job of it will be to take down to the level of the bulge and rebuild with brick bonding courses, two bricks high, and 3ft. apart; these bonders need not come to the face of the wall, but if they do will much improve the appearance. If it is not convenient to take down the wall, build a buttress in the centre of the length, the foundations being of equal depth to the wall foundations. Work it well into the wall, and build with brick bonding courses as before described. If there be any thrust upon the top this buttress will be required in any case; but if there be no thrust the buttress may be very well dispensed with.—F. R.

[814.]—TO DEADEN RINGING OF AN ANVIL.—The usual plan to deaden the sound of an anvil is to set it in coal ashes, which reduces the ringing considerably.—F. R.

[815.]—TO DEADEN SOUND.—Let the 3in. cavity between the 4½in walls be filled with cork shavings, which can be obtained at any cork-cutter's; this will entirely prevent sound from passing through the walls.—J. P. E.

[816.]—STAMPED SPECIFICATIONS.—It is not necessary to stamp the specification or drawings if they are numbered and referred to in the stamped agreement; but each drawing and each page of the specification must be signed by one of the parties to the contract, and the first page of the specification must contain the following, written in the margin:—

"This is the specification referred to in the contract signed by me this 20th day of April, 1868.

"(Contractor's Signature) JOHN THOMAS.

"(Witness) George Williams."

Each contract plan must also bear the same clause:—

"This is one of the drawings referred to, &c."—W. W.

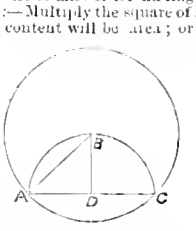
[817.]—MORTAR FROM OLD MATERIAL.—The following pertinent remarks are to be found in a work on cottage building, by W. Wilds, published by Weale:—"A London house is the real phœnix of the fabulist; for whenever a house is burnt down there, the sifted brick and mortar rubbish is made a component of the mortar with which it is rebuilt, and thus the new structure proudly rises from the ashes of its predecessor. This practice, however, is a little excusable, as it is more than probable that the sittings thus obtained will contain more grit, and consequently make better mortar, than some of the road dirt, which is frequently employed for a like purpose, containing, as it does, a large proportion of vegetable and earthy matter, with which it is impossible to make good mortar."—J. W.

[818.]—A DAMP SAFE.—Does the stone act as a vehicle for the moisture? Would it not be best so to isolate the safe as to have an air space round it, closed by metal or wrought-iron grating where abutting on the room? Or if the walling were built close towards the room the air space might have openings for obtaining circulation elsewhere, according to circumstances? Might not the lining be cemented or covered with slate bedded in cement? Without circulation of air to imbibe and carry off moisture no light or fire will avail.—G. M., Seaton Carew.

[818.]—My remarks of yesterday were made on the supposition of the safe being a portable one, with metallic casing complete. On reading the paragraph over again I see the safe to be probably a small room, in which case my former proposals would not be completely applicable. It should be ascertained whence the damp arises, whether from the cellar or through the comparatively porous stone walls. How would it do, as an experiment, to line the walls with glazed tiles, bedded in cement, or have a slate floor, ditto, or both? If practicable, a stream of dry air (warmed or otherwise) might be made to pass through the safe, entering (say) through the floor or side walls near the floor, and carried off at or near the ceiling; the opening for admission being towards one end of the chamber, and that for egress towards the other. Much, however, will depend on the special circumstances of the case.—G. M.

[818.]—A "Banker" is informed that I dried two new strong rooms, the walls, roof, and floor of which were constructed of freestone, somewhat damp (each room being larger, and the walls thicker than those of the one he describes), in the following manner:—I kept in each room for three or four weeks a strong gaslight burning day and night, with the door closed. The heat from the gas extracted the damp, and the rooms were, in the course of a few days, full of moist vapour; this was condensed on the back of the iron door, and on two 4in. iron pipes, which formed a branch of the heating apparatus of the building. Several times each day during the above period the door and pipes were well wiped with a dry cloth, and this process was continued until the vapour disappeared, and until none was formed on a piece of plate glass, which I took with me into the room as a test. The strong rooms were then quite dry.—J. W., Bufurt.

[824.]—TO MEASURE A DOME.—"Expectans" will find the following rule to answer for finding the superficies of domes spherical:—Multiply the square of sec ondal radius by the 3.1416, and content will be area; or multiply the



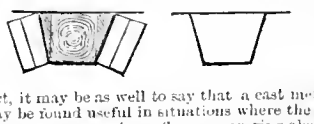
square of diameter of circle whose radius is equal to the sectorial radius by .7854. N.B.—As a circle whose radius is equal to sectorial radius is equal to area of dome, as per sketch.—L. SPONER.

[824.]—To measure the superficies of a semi-circular dome, multiply the square of the diameter of the base by 1.5708; this will give the superficies of any dome that is circular, and the height equal to the radius of its base.—W. R. ATKINSON, Uckfield, Sussex.

[827.]—GOTHIC ARCHES.—"Enquirer" is right as to the almost universal use of a perpendicular joint at the apex of Gothic arches in old examples. I may add that where they are not met with the stone is almost invariably broken.—RAPHAEL BRANDON, the Hall, St. Clement's Inn, Strand, W.C.

[827.]—In this instance "Enquirer," I imagine, has the best of the argument with his architectural friend. I have overhauled all the books on the subject ometattable, and find that they yield a majority of 3½ to 1 in favour of the perpendicular joint or "faulty construction" arch. I found more than one instance of semi-circular arches with a perpendicular joint. A keystone, or crown stone, would oftimes be very large and of awkward shape; and the perpendicular joint, if set in cement, would be even stronger than the brick or stone itself, as experience teaches there is no more danger of fracture of that joint than of any other. The greatest objection to the joint is in the case of visible brick arches, on account of the unsightly pieces at the crown; and the obviation of this is the greatest argument in favour of the pointed arch with one centre for the joints, as shown some weeks since. Amongst others, Mr. Burges, in the detail of his design for the law courts, uses the joint in question. In spite of the contingency of "Enquirer's" mistaking the mitre line of the mouldings for a perpendicular joint in some examples, a sufficient margin is left for his gaining a numerical victory, judging from archæology.—F.

[828.]—SUPPORTING A BEAM.—Ought not the sides of the wrought-iron strap to radiate in a line drawn from the centre of the arch? The triangular spaces left between the said sides and the beam should be filled in with chocks of hard wood or other suitable material. While on



this subject, it may be as well to say that a cast metal key to arch may be found useful in situations where the arched opening approaches a floor or covering above, and an aperture is needed for ventilation or other purpose. This last should have an internal rib or feather, for strength, and probably in many cases would not require the projecting flanges at top.—G.M.

[829.]—WROUGHT-IRON ROOFS.—If "Seeker" refers to page 220 of the last volume of the BUILDING NEWS, he will find a diagram to which the formulæ at page 750 are applicable.—E. S.

WAGES MOVEMENT.

The London painters are endeavouring to make arrangements to amalgamate into one great association. It is thought that the small feelings among the different societies will either prevent the formation of the project or its being carried out.

The Wapping painters' strike on the 6½d. or 5d. an hour still continues. Messrs. Jackson and Rolls offer 6½d., but the men stand out for 7d., and so there is little or no work doing for them. The affair has been made a trade strike.

The Liverpool master builders and the bricklayers in their employ have just taken a step which will prevent in future any resort to lockouts or strikes to enforce changes in the rules of the trade. Both sides have agreed to a series of regulations—to come into operation next month—which place all questions relating to overtime, country work, travelling expenses, payment of wages, &c., upon a basis satisfactory to all concerned; and they have also agreed that in the event of any dispute arising, it shall be referred to a court of arbitration composed of equal numbers of employers and workmen, with a final reference, if necessary, to an umpire, whose decision shall be binding upon both parties.

On the 1st of January last the labourers employed in the building trade in Derby addressed a letter to all their employers in that town asking for an advance of 2s. per week in their wages, namely from 18s. to £1, giving as their reasons for the demand the advance of rent and the high price of provisions. The masters, however, refused. The labourers' deputation then expressed their determination to have £1 per week or nothing, and although considerable correspondence ensued, no agreement was arrived at, but an immediate strike threatened. Upon this the masters, at a meeting held on Monday last, decided to resist the demand to the utmost, and a strike is, therefore, imminent.

STAINED GLASS.

The large window over the high altar in St. Teresa's Church, Dublin, has been filled with stained glass by Messrs. Earley and Powell, of that city. It consists of three large lights. The centre subject is St. Simon Stock receiving the scapular from the Blessed Virgin. The side lights contain the figures of SS. Elias and John of the Cross. The same artists have also just completed another window in St. Michan's Church, Dublin, the subject of which is the Mysteries of the Rosary.

The east window of St Silas's Church, Lozells, which consists of three lancet lights, has been filled with stained glass to the memory of the Rev. M. Walton, the first incumbent of the parish. The subjects illustrated are St. Silas and St. Paul preaching and being delivered from prison. The work has been designed and drawn in accordance with the early period of the architecture of the church—the thirteenth century, and has been carried out by Messrs. Hardman and Co.

The Marquis of Bute has placed a memorial window in Buccleuch-street church. It has been executed from sketches by the young Marquis, which sketches we are told "show great mastery of handling, and a thorough acquaintance with the history of Christian art."

STATUES, MEMORIALS, ETC.

The inauguration of a statue of Bernard Palissy is to take place at Saintes, where the famous potter was born, on the 3rd of the coming month of May. The fete to be given on the occasion will recall one of the most interesting events in the history of the town, namely, the entry of Charles IX and Catherine de Medicis, and their visit to Palissy, whom they took with them to Paris, where he was installed in the old Louvre, and executed some remarkable works; and where the remains of his kiln and a number of his moulds were discovered last year.

A site having at length been procured at the south-east corner of Woodhouse-square, looking down Clarendon-road towards St. George's Church, Manchester, it is intended to inaugurate the statue of Sir Peter Fairbairn on Thursday, May 14.

The committee entrusted with the erection of the Palmerston memorials at Romsey state that they will be ready for inauguration about the latter end of June or the beginning of July.

An additional statue has now been placed at the principal entrance to the members' private arcade in New Palace-yard—viz., one of King John. There are now three statues placed in the front of this arcade viz., Alfred the Great, William the Conqueror, and King John. The remaining three vacant niches will shortly have statues placed in them. These statues are of Portland stone, and stand 6ft. 6in. high. The bronze statue of the late Sir Robert Peel, which stood for some time uncovered at the central entrance to New Palace-yard, having been removed on account of the ineligibility of the site, will shortly be placed on a granite pedestal at the entrance to New Palace-yard fronting Parliament-street and Great George-street. The companion statue of the late Lord Palmerston will not be erected for some time.

Mr. Norman Macbath has been commissioned by the Council of the Edinburgh Royal Society to execute a portrait of the late Sir David Brewster. The painting will be hung in the Society's Hall.

LEGAL INTELLIGENCE.

An action was brought by the Duke of Buccleuch against the Metropolitan Board of Works to recover the amount awarded to him by Mr. Charles Pollock, Q.C., acting in the capacity of umpire, as compensation for having been deprived of the use of a pier or jetty running down from his grace's residence, Montagu House, Whitehall, to low water-mark, and for the mansion and lands having been depreciated and otherwise injuriously affected by the works carried on by the defendants under the Thames Embankment Act. The trial took place before the Lord Chief Baron on the 8th February last, when a verdict was returned for the plaintiff for the full amount claimed, £8,325 and interest. Mr. Hawkins, Q.C., now moved, pursuant to leave reserved, to set aside the verdict, and enter a verdict for the defendants or for a new trial, on the ground of misdirection, and that the verdict was against the evidence. His grace and his ancestors had been lessees of the property for upwards of two centuries. There was an old lease from the Crown, which expired in 1868, but some years prior to that period a fresh lease was granted to the duke for 99 years on consideration of his laying out £20,000 in the erection of a new mansion. He had actually expended between £80,000 and £100,000 in building the existing Montagu House. Mr. Hawkins submitted that there was no grant of the jetty to the duke under either of the leases, that the jetty was really public property, and that therefore he was not entitled to compensation in respect of it. Mr. Baron Martin said it appeared that the jetty had existed from the time of Charles II. There could be no doubt the stairs belonged to the old Palace of Whitehall, and the Crown could make a grant of them to anyone. The Lord Chief Baron concurred. The court granted a rule generally.

Liabilities of Architects.—Swatridge *v.* Colson. This was a case tried at Sherborne, in which the plaintiff, a marble mason, of Yeovil, sought to recover £16 13s. 8d. for two stone chimneypieces. The defendant, who is an architect residing at Sherborne, had been engaged in erecting a rectory at Sandford, and in accordance with his instructions, the plaintiff had made the two chimneypieces, for the value of which he now sued. The defendant, on being sworn, said that Swatridge called at his office early in 1867, requesting that he might supply some of the chimneypieces at the rectory, and after some delay he obtained the consent of Mr. Gale, the contractor, that Swatridge should be employed. The chimneypieces were accordingly executed under his instructions, and the plaintiff's account was passed by him, and sent in to the contractor, who had since become bankrupt. The other tradesmen, however, who had attended at the settlement, had been paid, and if Swatridge had attended his claim would in all probability have been settled. He contended that the order had been given by him in the ordinary way of business, and that as an architect he could not be held personally liable. The judge said there was no doubt that Gale was the contractor for the works. It must be very strong evidence that would make him believe that the case was one out of the ordinary run of business by which an architect made himself personally liable, instead of merely giving directions. They had been told that before the work was done the plaintiff was informed of the name of the rector and the contractor, and that he offered 5 per cent. on any commissions defendant could obtain for him; if that was so it was conclusive, and it had not been contradicted; and it seemed that plaintiff had also inquired as to the means of Gale, in reply to which the defendant had read several letters as to his character, and had informed him of his sureties. All that was perfectly inconsistent with the supposition that he looked upon the defendant as making himself personally liable, and nothing having been made out to his satisfaction that the verdict should be against the defendant, he should give it for him, with his personal expenses.

Our Office Table.

A new popular dictionary of Ecclesiastical Art and Institutions, from primitive to modern times, entitled "Sacred Archæology," by the Rev. Mackenzie E. C. Walcott, Precentor of Chichester Cathedral, is announced for publication. A work of the kind is a great want in the literature of the day, and we know of few so well fitted for its preparation as Mr. Walcott.

The witty art critic of the *Bombay Gazette* gives an anecdote of the Viceroy. Sir John Lawrence, it appears, finding the other day that the cost of a building had already exceeded the estimate before the second storey had been commenced, he at once ordered it to be roofed. "There is a stern morality and Cromwellian ruthlessness about this," says the *Bombay Gazette*, "which profoundly excites my admiration—the savage Gaul flinging his sword into the scale against Art! But necessarily art cannot spring up and flower under such a barbarian."

A new field for building operations has just been opened out. The Metropolitan Board have purchased Tooting Common in order to convert it into a public park like that at Kennington. Tooting has long been a favourite district, on account of its rural beauty; it will now become much more so, and villa building will probably soon be very brisk all round the locality. The sum to be paid for the common is £10,200.

The Earl of Dudley, Lord S. Cecil, Mr. Gladstone, and Messrs. D. Hanbury, G. Moffat, R. Redgrave, and J. Tyndall are noted in the list of persons employed by the South Kensington Department of Art and Science, in connection with the Paris Exhibition, as having declined to receive any remuneration for their services as jurors. Other noblemen and gentlemen have not been so squeamish, the usual fee accepted by each of them for travelling and personal expenses being £52 10s. It is hardly necessary to state that Mr. H. Cole, C.B., comes in for the lion's share of the remuneration. In fact, his services have been rewarded and gratituded in the most handsome manner.

On the 8th inst. the employés of Messrs. Pictor and Sons, of Box, Wilts, stone merchants, were entertained, to the number of 300, at dinner in the new workshops, to celebrate the coming of age of Mr. W. S. Pictor, and his accession to the business. The festivities were continued till a late hour, and the men retired thoroughly pleased with their entertainment, notwithstanding the arrangements had been conducted on strict total abstinence principles, which are energetically advocated by the firm. The workmen employed at Messrs. Pictor and Son's London depôt at Paddington also participated in the general rejoicings, and were invited to a good supper.

Last year the cathedral authorities set a good example by laying down gravel walks and planting out shrubs and flowers in St. Paul's churchyard. Although only done to a very limited extent, it considerably improved the place, and we hoped to have seen a little more attempted this year. Nothing, however, appears yet to have been done, and the churchyard is relapsing into its old neglected state. If it is to be done this year "t'were well it were done quickly."

The late Mr. Felix Slade has bequeathed to the British Museum his collection of glass, consisting of vases and other objects illustrative of the art of glassmaking from the earliest period to the end of the seventeenth century. He has bequeathed £45,000 to be applied to the endowment of fine arts professorships at Oxford and Cambridge, and at University College, London, where some exhibitions also are to be founded.

The Demidoff Gallery in Paris was sold last week, and produced the magnificent sum of upwards of £55,000. The whole gallery consisted of twenty-three pictures. One Ostade fetched £1,300; a Paul Potter, £4,400; a forest scene, Hobbema, £4,400; and a Cuyp, £5,600. Lerburg's, "The Congress of Munster," was bought, as is supposed, for Baron Rothschild, for the large sum of £7,280.

This year's estimates present a vote of £15,000, which will be required for the supply and repair of furniture in the Government offices. It appears always to cost upwards of £12,000 a year to keep the Government offices supplied with furniture! Query, Does this gigantic sum mean wear and tear of desks and stools from enormous use, or does it mean excessive breakage?

The value of old paintings exported from Rome in 1867 was 50,541f.; that of modern paintings, 778,246f.; ancient sculpture, 16,359f. modern sculpture, 1,778,162f. Total value of works of art exported in 1867, 2,623,310f., being an increase of 99,715f. on those exported in 1866.

Last week, a plumber in the employ of Mr. Howard, builder, was sentenced to four months' imprisonment, with hard labour, for stealing lead, the property of his employer. It appeared from the evidence that the prisoner was employed at an hotel being built at Eltham; lead had been missed from the works, and the prisoner was suspected and watched, and was seen to leave the works with lead in his possession, and take the train to London. The foreman immediately telegraphed to his employer's office, and the prisoner was met at the station and 36½lb. of new sheet lead was found concealed about his person.

From the report of the Minister of Public Works in Italy for 1869, we learn that, on the 31st December, 1868, the sum of 48,200,000f. will have been expended on the Mont Cenis tunnel. Eight millions more are to be spent next year. If the expenses continue at the same rate, and if the tunnel be completed, as is hoped, in 1871, its entire cost (exclusive of the two bits of railway that are to connect it with Susa and St. Michael, and which will be enormously costly) will not fall short of three millions sterling. A portion of this will, however, be borne by France.

The Florence correspondent of the *Times* says that Colonel Avet, of the Italian Staff Corps, has for years busied himself in seeking means for transforming a photographic impression into an engraving otherwise than by the ordinary tedious manual labour. He has at last perfectly succeeded. In twenty-four hours, says this correspondent, Colonel Avet can copy a large topographic drawing, reproducing it, beautifully printed, on either a reduced or an enlarged scale. Some of his reproductions are so small that they can be made out only by the help of a strong magnifying-glass. The result of his most valuable invention will be to save the immense amount of labour and loss of time hitherto indispensable to the multiplication of topographic drawings. The invention may be applied to all kinds of drawings without distinction of subject.

The vestry of St. George's, Southwark, contemplate laying down a tramway in the centre of the London-road, for the use of all kinds of vehicles. If successful, similar trams will be adopted on other roads in the parish.

Four new pictures have been lately added to the collection of the National Gallery, viz :—"The Madonna, Infant Jesus, and St. John," by Morando; Venetian School, two portraits by A. Borgognone, and "Tobias and the Angel," by Pollajuolo.

The Vieille Montagne Zinc Company has decided to appropriate the prize of 10,000f., gained at the Paris Exhibition, for the benefit of their workmen. The money is to be invested in Belgian Stock, and the annual dividend of 450f. is to be awarded yearly to such workman or workmen as shall be deemed most deserving.

The Paris correspondent of the *Morning Post* says that one of the first questions a stranger asks a Parisian is, "where does the money come from for building these magnificent boulevards and streets, which are to be found in the course of construction in nearly every quarter of the metropolis?" If he goes a little into the financial question of the building of new Paris, he is sure to get into a bewilderment and mystification which no one is able to clear up, because financially there are no means of arriving at a conclusion as to whether the expenditure of so many hundred millions sterling on churches, theatres, public offices, and private dwellings, will ever give anything like remunerative percentage on the capital employed. The City of Paris, or rather Baron Haussman, appropriates and commands a new line of buildings, and then seeks funds in all directions, at home and abroad, for substituting a class of handsome houses which naturally can be only occupied by a wealthy class of tenants. The Prefect of the Seine publishes an annual budget, which, oddly enough, is made every year to show, as far as figures are concerned, an equilibrium.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

2522 F. VERSMANN. Improvements in the Manufacture of Varnishes. Dated September 5, 1867.

This invention relates to the use of certain solvents for the gums, resins, or gum resins employed in the manufacture of varnishes, and it is particularly applicable to obtaining solvents of copal for that purpose. The solvents employed are these:—Alcohols of the series represented by the formula $C_n H_{2n+2} O$ (C = 12), containing more than two equivalents of carbon, beginning therefore with propylic alcohol = $C_3 H_8 O$. The mixture of some of these alcohols known as fusel oil, which contains chiefly anylic alcohol, answers the purpose very well.—Patent completed.

2579 W. E. NEWTON. Improvements in Saws. (A communication.) Dated September 11, 1867.

The patentee claims, first, perforating saw blades with a number of holes in rear of the teeth, as set forth, for the purpose of admitting of the lengthening of the teeth when the latter are worn away by use, without the process of "gumming" or re-cutting the throats or spaces between the teeth. Second, the use of male and female dies constructed and arranged, as shown and described for the purpose of cutting out the teeth or the throats, or spaces between the same, and also the holes in rear of the teeth, at one operation, and admitting of the adjustment of the parts which cut out these holes in such a manner that the latter may be cut or punched in straight or curved lines, as may be required. Third, securing the angle sockets to the saw blade by rectangular slots in the ends of the saw blade and the screw bolts provided with the taper portion, as set forth.—Patent completed.

2580 W. F. COOKE. Improvements in Tunnelling and Quarrying Slate and other Minerals, and in Machinery used for these Purposes. Dated September 11, 1867.

The patentee claims, first, tunnelling or quarrying slate and other minerals with a tunnelling machine working in combination with a traversing machine to cut parallel tunnels into the slate or mineral, as described. Second, tunnelling or quarrying slate and other minerals with a tunnelling machine cutting into the slate or mineral parallel tunnels intersecting one another, as described. Third, the quarrying by cutting into the slate two parallel rows of tunnels, one above the other, or at a distance from one another, and afterwards sawing or cutting away the block of mineral between the two rows of tunnels, as described. Last, constructing tools in the manner described or cutting away at the back of a circular block of slate or mineral which has had a groove cut around it by a tunnelling machine.—Patent completed.

2612 W. LE DUC. Improvements in the Mode of Covering Roofs with Slate or other Materials, which Improvements are Applicable also to the Covering or Forming of Walls. Dated September 17, 1867.

Here the pieces of slate, &c., are made in the form of squares, having two of their corners situated diagonally opposite to each other cut off or removed, so that the piece of slate when prepared for use presents the form of a six-sided figure. In laying the pieces of slate they are arranged in horizontal rows, with their shorter sides in juxtaposition, the lower rows being first laid, and each succeeding row above so placed that its lower corners overlap and cover the joints or intervals between the shorter sides of the pieces of the lower row.—Patent completed.

2621 A. M. CLARK. Improvements in Valve Closet Apparatus, part of which is Applicable for Regulating the Flow of Water in other cases. A communication.) Dated September 17, 1867.

This invention consists, first, in the application to such apparatus of an elastic valve of peculiar construction as a substitute for the arrangement now in use. Second, in means of regulating the pressure of the water in the pipes, which is also applicable for regulating the flow of water in other cases. Third, in the application to water-closets generally of means of separating the solid and liquid matters in the basin itself. Fourth, in the application of a cock for regulating the pressure of the water from the mains, which also regulates the supply to the basin.—Patent completed.

2641 W. POTTS. Improvements in Apparatus for Ventilating Rooms and Buildings. Dated September 20, 1867.

The patentee claims constructing and arranging in the cornices of rooms and buildings, or at the highest convenient part of the room or building, two independent or separate channels, situated at different levels, the upper one serving to collect and remove the hot and vitiated air from the room or building, and the lower one serving to introduce cool and pure air into the room or building, the hot and vitiated air entering its channel, and the cool and pure air passing from its channel through ornamental or other perforations or wire gauze, as described.—Patent completed.

2665 A. MACKENSIE and S. ROBINSON. Improvements in Apparatus to be Applied to Cisterns for Preventing Waste of Water. Dated September 21, 1867.

In applying this invention to water-closet cisterns, for example, the patentees construct inside the cistern, at the lowest part thereof, a gauge chamber of sufficient capacity to contain the requisite amount of water for one flushing of the closet. A small aperture is made in the side of this chamber at the bottom for filling the same from the surrounding water in the cistern, such aperture being opened by the act of closing the principal valve of the cistern, and closed when such valve is opened, a small inlet valve being employed for that purpose adapted to the aperture referred to. At the bottom of the gauge chamber there is fitted the valve-seat and valve, opening either into the old service box, or into a supply pipe leading direct to the basin. This valve is provided with a tubular spindle, having a piston, being connected to a float inside the closed chamber before referred to, and on the lower part of the piston is formed a valve cap, and on the upper part of the tubular spindle through which the piston works there is formed a valve-seat, so that when the piston is raised by the float to a given height, the second passage for water (namely, the passage through the tubular spindle) is closed, and remains closed until, by the opening of the principal valve, the chamber is emptied. This piston is further coupled by a wire to the usual overhead weighted lever which is connected to the "pull" or handle of the closet. The object of the entire arrangement is, first, to admit the full complement of water in the closed chamber to pass down through the principal valve when opened; and, second, to permit of a certain gauged or regulated quantity of water sufficient to fill the pan of the closet to descend through the tubular spindle of the main valve after it has been closed. This latter is the result of the quantity of water admitted to flow through the small open aperture being in a certain proportion in excess of the quantity which can pass down through the tubular spindle or piston valve, and, consequently, the chamber will in a short time become nearly full, and the float raised so as to close the inner valve. This float, however, is not sufficiently buoyant to open the principal valve.—Patent completed.

2677. W. COOKE. Improvements in Apparatus for the Regulation of Up and Down Currents of Air. Dated September 23, 1867.

This invention consists of an apparatus that effectually regulates the up and prevents the down draught in shafts or chimneys by the application of outer flanges or breaks to an upright tube or shaft open at both ends, having angular or other shaped openings in the sides, with inner tubes perpendicularly arranged, so as to direct the upward current of the air or smoke, permitting it freely to ascend, the whole apparatus acting as an exhauster of the air, facilitating the upward current, the openings at the sides serving as escapes for the downward current.—Patent abandoned.

Trade News.

BATH STONE OF BEST QUALITY.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Henry Botsford, South Norwood, builder, May 5, at 12.—James Costin, High street, Hoxton, plumber, May 5, at 12—David Fox, Ramsgate, builder, May 6, at 1.—John Stephens, Hammersmith, builder, May 6, at 11.

TO SURRENDER IN THE COUNTRY.

Hillman Fenner, St. Lawrence, Isle of Thanet, carpenter, April 29, at 12.—James Pattinson, Carlisle, joiner, April 28, at 11.—William Bainton, Hull, bricklayer, May, 4, at 11.—George Chapman, New Duston, near Northampton, carpenter, May 2.—William Curtis, Sen, Docking, Norfolk, bricklayer, May 7, at 3.—Henry Hodgson, Liverpool, assistant surveyor, May 4, at 3.—Joseph Lovell, Weston-super-Mare, painter, May 4, at 11.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

May 22, W Ranger, Lewes, builder —May 22, H. Morris, Newbury, builder —April 30, J. Robbins, Liverpool, tiler.—May 6, S. Phillips, Swansea, mason —May 19, G. Llewellyn, Pontypool, painter. May 12, W. Nicolls, Robertsbridge, carpenter.—May 29, G. J. Bell, Norwich, builder.—May 29, J. R. Stephenson, Monkwearmouth Shore, painter and glazier.

BANKRUPTCY ANNULLED.

Uriah Halsall Jones, Farraday street, builder, April 8.

DIVIDENDS.

May 6, G. Green, Greenwich, builder —May 2, R Pawley, St. Mary Church, Devon, mason —May 7, R. Sherlod, Darlington, builder.—May 7, R. Coates, Hurworth-upon-Tees, brickmaker.—May 8, W. Palmer, Middleton one-row, joiner.

PARTNERSHIPS DISSOLVED.

Frith and Co., Sheffield, surveyors.—J. and G. Willis, Gravesend, timber merchants.—Spargo and Richards, Truro, stonemasons.

THE BUILDING NEWS.

LONDON, FRIDAY, MAY 1, 1868.

THE ARCHITECTURAL EXHIBITION.

WE heartily recommend every reader of the title of this article to visit the galleries at No. 9, Conduit-street. There are amongst our readers many to whom we would add, let this visit be a long one, a whole day, or, if you cannot manage to give a working day, give its equivalent of time in evenings. Do not suppose that we are asking you to indulge in amusements, and to spend your money on a society whose interests we desire to uphold. If it should so turn out that you are amused as well as instructed, and the society benefited as well as yourself, these are merely subsidiary parts of the great outcome we desire. To the architectural pupil or young assistant who has so much to meet out of a very limited income, the admission shillings to the many art exhibitions which crop up between January 1 and December 31 make up a sum quite worth considering, and the chief consideration is, or ought to be, how to make the expenditure profitable.

There are, we take it, four drawbacks to the educating power of the Architectural Exhibition. There is the *conversazione*, where you lounge about gabbling or drawling out passing criticisms for the edification of the ladies. You affect to look down upon all the exhibitors and all their works; you say what you think to be a clever thing about A, and you have your shallow laugh at B, and so your friends, filled with your trivial chat and overflowing with professional scandal, vow they never had such a delightful evening, and never come again. The second drawback is the extra use to which the rooms are put during the exhibition. For instance, in the first room, where the Manchester Townhall drawings are hung, the Architectural Association hold their meetings. It needs no words to show the sort of value we put on that which costs us nothing. The members of the association are just as human as the rest of us, and as they become familiar for hours together with the designs in the chief competition of the year, familiarity brings forth its natural product, and it would not be surprising if the members of the association neglected to use the exhibition for their good, or in any sense to study therein what to do or what not to do. What we say emphatically of the younger men in the profession may be reechoed up to the very steps of the throne of the Institute. If we all used the exhibition as we ought to do, and if we all had as much simplicity and humility as our old friend Wilars when he lauded the architects of Laon and Rheims, and sketched with a view to development the architectural forms of his immediate predecessors and contemporaries, the galleries at Conduit-street would be visited by every one interested in architecture. A would learn how to arrange sculpture from B, and B would learn how to group his voids and masses from A, whilst both A and B might turn to the French drawings, and learn many a lesson in common. And this reminds us that the feature which distinguishes the present from all past exhibitions is the presence of some of the finest works of our contemporaries at Paris. The greater part of one side of the large gallery is occupied by French works. We have six coloured drawings of Prince Napoleon's house—no pretty tricky views, but genuine architectural drawings, elevations, sections, and details; one or two public buildings; and a magnificent set of drawings by M. C. Lameir, illustrating in plans, sections, details, and perspectives the most complete schemes of painted decoration we have ever seen. We shall have much to say on this work in a future article; meanwhile we commend it to the closest study our readers can give it, feeling satisfied that no one with *seeing* eyes can fail to derive much profit from this grand monumental *projet*, which so nobly illustrates the mighty vision of St. John in Patmos. It must not, however, be thought that we give unqualified praise to M. Lameir. With one or two exceptions the drawing and design or arrangement are of the very highest class, but when we come to consider the question of colour, our verdict is by no means so favourable. This is, however, one of the questions we propose to discuss in a second article.

After the French drawings, which ought by themselves to make the treasury overflow with shillings, the most interesting designs are the competition drawings for Manchester Townhall, the three premiated designs in the first competition for the Bristol Assize Courts, and the competition designs for the Churches at Great Yarmouth and Lincoln. It is very unfortunate for the sake of criticism that the *selected* architects in the Manchester competition should have sent their last drawings instead of their first sketches, for the unfortunate men who exhibit their "sketches" are manifestly at a disadvantage in measuring with those who exhibit richly coloured perspectives in frames 6ft. or 7ft. long. Of those who were placed by the adjudicator in the first competition five exhibit not their original designs, but their finished drawings—Messrs. Waterhouse, T. H. Wyatt, Scott, Worthington, and Speakman and Charlesworth. Amongst those who were never, so to speak, in the running, we have the designs of Messrs. Godwin (E. W.) and Crisp, Prichard, Roger Smith (scratched), Lamb, Ridge, Talbert, Rogers and Codd, and Dunk. The influence which the designs for the Law Courts has had upon some of these designs is very remarkable, notably so in the cases of Mr. Worthington and Messrs. Speakman and Charlesworth, who have helped themselves bountifully from Mr. Burges and Mr. Scott. Indeed, Mr. Burges's thirteenth century translation of the dormer windows of the Hotel de Cluny and the Château de Josselin has been hailed as a discovery, and must be regarded as a great success.

In ecclesiastical work the most important contributions are from Messrs. Wilson and Nichol, Hadfield and Son, Street, W. White, Seddon, and Giles and Robinson. In domestic work we recognise some new views of old friends. Amongst the Gothic work, Messrs. Godwin and Crisp, and Mr. W. White; in Italian work, Mr. Cockerell and Mr. Edis; for smaller works, Messrs. Curzon, Watson, Seddon, Chancellor, and W. Parnell deserve notice. We have this year but one warehouse of importance illustrated in a very large drawing by Mr. Rowland Plumb. The very bad works are not by any means so numerous as in past years. Of "successful men" Mr. Truefitt and Mr. Lamb are certainly not up to the mark. Mr. Lamb is more fanciful and transformationesque than ever, and Mr. Truefitt is trying to be original by the weakest of all contrivances, viz., the conjunction of different styles; his bank at Manchester will not do as a guide to the architecture of the future. Mr. Wimble exhibits something in Southwark-street, and helps thereby to keep the tradition of the Strand Music Hall before us. Designs for decorations and furniture are still few and far between. We are glad to see Mr. Albert Moore's design for the decorations of the Queen's Theatre, Long Acre. It is a pity the drawing should have been so badly mounted and the figure subject omitted. The architects who favour strong colours and violent contrasts, whose eyes can rest well pleased on vermilion furniture and yellow walls, will very naturally oppose Mr. Moore's scheme and call it weak and washy; and we must give such people full credit—to them it is weak; but the degree of sight power is very various, extremes should be avoided, and the strong grasping vision of the clear-sighted man should no more be permitted to force an over-tenderness of colour than the dulled eye should be allowed to have its way and force its hard colour and violent contrasts on unwilling eyes. The mass of people are neither acutely sensible to colour nor are they altogether lower than the dull, and what they want, and what will do them good, is neither higher tone nor lower tone, but purer tone. We do not want you to play a fantasia until you have tuned the piano. Mr. Burges exhibits photographs of some of his very masculine designs, as executed in the shape of furniture, cups, flagons, inkstands, &c.

It remains for us to direct attention to three important features of the exhibition. Two screens are covered with the original studies made by the late Sir C. Barry, for the Houses of Parliament. These are in every way interesting; how the interest would swell if we had two more screens covered with the original studies made by the late Mr. Pugin! The Architectural Association have put forth great strength this year, and the works of Messrs. Lonsdale, Lee, and Vialls are in every way vigorous and careful. Messrs. Evill, Davie, Jones, and Spiers also exhibit good promising work. We have one word to say to these gentlemen: think out for yourselves the problem you have set yourselves to solve, and do not begin by asking yourselves the questions, has this been done before, and by whom. We think, too, that it would be a far more satisfactory and helpful test if the members of the class of design would consent to set aside longer evenings and work out a design at one sitting in the association rooms without reference to books, and well separated from one another, the subject not to be known beforehand. We might not have such careful and effective drawings, but then we should have more of the man; Mr. Spiers would give us more of himself and less of the fountain designed years since for Gloucester; Mr. Jones would not have time to deck up his railway station like a Viollet le Duc etching; and Mr. Vialls would not take so much inspiration from designs made eight years ago. The work of the Association is so good that it would be insulting to make any apology for these few words of suggestion and criticism.

We have now arrived at the last, or, as it stands in the catalogue, the first portion of the exhibition. The original drawings of old works are not much, if anything, in advance of last year. The most careful works are those by Messrs. Cole, Wheeler, Cockerell, and Spiers. Amongst the group of sketches Messrs. Seddon, Watson, and Lonsdale may be noted, especially the latter. At the top of the large room Mr. Cockerell exhibits his father's drawing for the Royal Exchange, and Mr. Childs has a careful oil painting of the Rathhaus, Cologne. We had almost forgotten to mention Mr. W. B. Scott's coloured cartoons for wall paintings hung at the top of the room. We can only wish, for Mr. Scott's sake, that the room had been three times as high.

THE ROYAL ACADEMY.

THIS year the Royal Academy of England celebrates its centenary. One hundred years ago this society was established for the encouragement and support of the three sister arts, Architecture, Painting, and Sculpture, the encouragement and support taking the form of (1) a training school, and (2) admission to membership in the society. Of the school, we do not intend to say anything just now, although we are quite conscious of what may be said of it. At the foundation of the Academy the number of members was limited to sixty, independently of the two or three engravers who were thought worthy of the honour. Of these sixty, forty were considered full members and enjoyed the highest art privileges England had to offer, and were permitted to subscribe themselves R.A.; the remaining twenty, or the novices of the society, from whom alone the R.A.'s were recruited, being dignified by the title of Asso-

ciates and allowed to subscribe themselves A.R.A. Passing by the apparent anomaly that the higher degree should out-number the lower, from which it was recruited, we have to face a still more remarkable anomaly, viz., that during the past century no provision has been made by the society to meet the growth of art and the increase of the art population, or, to put it another way, in 1868 there are only sixty honours to be won by a band of artists who muster in six times the force that they did one hundred years ago, when the same number of honours were to be won. The architectural profession, which has increased during that period in a far greater ratio than its sister professions, is thus considerably worse off in all its relations, so far as honour is concerned, than it was before the foundation of that society which professes to be its foster nurse. Not only is this limit of the eighteenth century rightly felt to be an injustice in the nineteenth century, but a further injustice naturally hinges upon this increase of artists, inasmuch as the wall space which might have been abundant a few years ago is now absurdly inadequate. This latter drawback promises, however, to be very soon a thing of the past, as the new building at Burlington House is now so far advanced that we can see no reason why the next Royal Academy Exhibition should not be held within the new walls. That the illiberal inaction above mentioned could have ever been presented to the minds of such men as Messrs. Richmond, Millais, Frith, Leighton, Calderon, and other members of the Academy, is a thought almost too preposterous to entertain, and yet they are placed on the horns of a dilemma, inasmuch as it is almost equally preposterous to suppose that such men could exist so ignorant of the times in which they live, so unconscious alike of the stagnation of the Academy and the rapid strong growth of the art population around them; for had they been conscious of the latter it is hardly conceivable that they would have sent such a large number of their works, for the good hanging of which they have a right by virtue of membership, to the manifest exclusion (so long as walls are not elastic) of hundreds of worthy pictures. Mr. Richmond, for instance, has on the line this year at least seven portraits. Now, it may be very gratifying to my lord bishop and Mr. Dean and to all their friends to see their portraits placed side by side with Millais's lovely Rosalind, or shoving this great painter's Stella above the line; but is it a particularly pleasant thing for Mr. Richmond and these worthy divines to contemplate the suffering and the broken hopes of many a young and earnest worker, who, from this trifling pride of place, is forced to eat his bread unbuttered for the next twelve months? Would it have made any difference to the bread-and-butter of the R.A. had he been content to have been represented by two instead of half a dozen pictures?

The first glance at this year's exhibition is sufficient to show us that it is not up to the mark of past years. From what we have already said it will be inferred that the members exhibit a great number of canvasses. This at no time in our memory was ever a necessary element of a good exhibition; but this year, from some cause or other, whether owing to the panic, or whether, as the man who stole the pocket-book says, something has disagreed with them, certain it is that even those from whom we used to get fair average painting are this year far below their standard. Mr. Frith, a young—comparatively speaking, quite a boy—R.A., appears suddenly to have fallen into the sere and yellow leaf. Mr. Horsley, R.A., in his "Rent-day at Haddon Hall," is equally retrogressive. Going higher in the scale, we cannot understand how the painter of such a picture as "Whither?" (Mr. Calderon, R.A.) could have wrought such works as the "Œnone" and "Hamlet." There are few pictures better than "Whither?" which is his diploma picture, and, we understand, was painted a year or so back; but between this and the others the artist has chosen to place a great gulf. Messrs. Faed, Nicol, Pettie, Ansdell, Lee, Thorburn, Ward, Richmond, Knight, Leighton, Elmore, Goodall, O'Niel, and Armitage, members of the Academy, are all more or less below what they have at times led us to expect of them. Of course there are R.A.'s who, like curious old port, have lost their body and colour, remaining as we have always known them, and thus, for obvious reasons, are not worse than usual. Among the painters who have distinguished themselves and made their mark deeper we may mention Mr. Poole, R.A. His "Drifting Boat in the Moonlight" is a poem to be remembered, and *will* be remembered, for it gains much of its power from its simplicity. Sir Edwin Landseer, R.A., in his "Dead Deer and Dog," shows, too, that he has not lost his cunning. Mr. Millais, R.A., exhibits in his "Stella" that he has powers in reserve. His four other works more or less maintain his justly earned fame. Mr. Frederick Walker, in his "Vagrants," takes rank with the best, and has painted a picture that the rising English school may well be proud of. Following these we have Mr. Orchardson, A.R.A., who makes us long for more of his work; Mr. Marcus Stone, whose "Interrupted Duel" is far in advance of his last year's production; Mr. Storey; Mr. Yeames, A.R.A.; Mr. Hodgson, who contributes a Chinese interior and a Roman galley "Off the Downs in the Year One"; Mrs. Ward, who takes the lead of the lady exhibitors in her "Lady Jane Grey Refusing the Crown"; Mr. Marks, who is comic as usual, in his "Experimental Gunnery"; and Mr. G. D. Leslie, A.R.A., who is always refined. For portraits commend us to Mr. G. F. Watts, R.A., and Mr. Wells, A.R.A. In landscapes, the veteran Linnell leads; Mr. Hook, R.A., is as strong and as faithful as ever; Mr. Brett has drawn the sea, and Mr. Henry Moore has two capital studies.

A new element in this year's exhibition is the presence of two distinguished foreign artists—Baron Leys, with one of his faithful representations of late mediæval subject; and Edouard Frere, who gives us a picture embodying, as do all his paintings, his fine sense of child-life.

The only decorative painting is a large life-size figure, by Mr. Albert Moore, which ought to have been hung with the architectural drawings. The architects who exhibit this year belong essentially to the modern school. Mr. E. M. Barry, A.R.A., and Mr. Street, A.R.A., have sent drawings, but where are the R.A.'s? and why should we have three drawings of Crewe Hall? It is true they are not all on the line, but it would have been more satisfactory to have had some other works represented. Mr. E. W. Godwin exhibits one of the premiated designs in the second competition for the Bristol Assize Courts. He has also a view of Glenbegh Towers, and two small pen-and-ink drawings of lodges at Castle Ashby. Mr. Waterhouse shows in his view of Manchester Townhall a very marked improvement on his Law Courts' design. Mr. Digby Wyatt sends a view of the Court of the India Office, and Mr. Burges reappears with Cork Cathedral. Of these and other works we shall have more to say in a future number.

THEORY OF PUMPS.

MANY of our readers doubtless remember the time when all supplies of water in the metropolis were obtained through the instrumentality of the traditional pump. Happily the *ancienne régime* has passed away, so far as London is concerned, but, in the majority of our towns, it is still in full vigour. The well and the cesspool are sunk in as close proximity as ever, and the one continues to supply the other with the seeds of fever, cholera, and death. In all country districts, isolated villages, and outlying localities, the pump must long remain as the only means of obtaining from a water-bearing stratum a sufficient quantity of that indispensable fluid. The term "the pump" is, in fact, almost synonomous with that of water, and we remember an amusing anecdote of our younger days in connection therewith. Having occasion to get a prescription made up at a country apothecary's, we proceeded to his compounding apartment, and awaited, with the usual curiosity, the filling of his medicinal "bottle." After duly measuring and pouring in the prescribed tinctures, decoctions, and infusions, which occupied about three-fourths of the bottle, it became necessary to "fill up" with water. The son of Galen, not willing to betray to uninitiated ears the mysteries of his art, and ignorant, also, of our acquaintance with the dead languages, turned to his apprentice and demanded of him, in a pompous tone and in execrable Latinity, some "*aqua pompaginis.*" In addition to the common pump, employed solely for drawing water from a well, another familiar example is that by the aid of which the fluid is driven or forced to a higher situation, such as the cistern or reservoir for supplying water-closets, bath-rooms, and other premises placed nearer the top storey of a dwelling house. Although numbers use these and another description of pump daily, yet few understand either their mechanism or the principle upon which they act. Both are simple, and we trust will be easily comprehended after the perusal of the following description. A knowledge, also, of the nature of their construction, and the theory of their action, is of great value to all those who may have to rely upon their resources, more especially when, as frequently happens, there is no extraneous assistance to be obtained for putting them in order, or getting repairs done, when some of their parts become deranged from bad usage or carelessness.

All pumps may be classed under three heads—namely, the suction, the forcing, and the compound suction, or suction and lifting pump. The first of these, as its name implies, draws up the water by actual suction, that is, by exhaustion of the air in the pipe and barrel, or body of the pump, and will be easily understood from an inspection of fig. 1. At the top of the suction pipe, the bottom of which dips into the water in the well, is fixed a valve A opening upwards, and the piston B, which works air-tight in the pump, is furnished with a similar valve, also opening upwards. The piston rod C is moved by a handle in the usual manner. Before proceeding to state the theoretical conditions attendant upon its action, we will first practically investigate the subject. Let us suppose the whole apparatus to be in its normal condition, in which the valve A will be closed, and the piston B, with its valve also shut, resting close down upon A. Under these circumstances, the pressure above and below the piston and the two valves being equal, there will be general equilibrium, and no motion in any direction will ensue. If the piston B be now raised, the small quantity of air or clearance existing between it and the valve A when it was resting upon it becomes expanded in volume, and consequently the downward pressure it exerts upon A is now no longer equal to that which it exercised previously to the raising of the piston. Equality of the two pressures upon the upper and lower surfaces of the valve A being destroyed, motion takes place in the direction of the lesser, and the valve A opens, allowing, first, the air in the suction pipe, and, subsequently, the water from the well, to pass up into the pump. A few more strokes of the piston and the downward pressure is still further diminished, permitting more water to flow up the pipe. Upon the descent of the piston B it now enters the water, and the valve in it opens, allowing the water to escape through it and fill the barrel of the

pump. When the piston B descends, the valve A remains shut, owing to the downward pressure upon it, and when the pistou rises it opens. The water once being admitted through the valve B, the piston at the next ascent lifts the water to the spout, from which it is discharged. From the above description it is manifest that the water is raised from the well by the establishment of a vacuum in the barrel of the pump, the real agent being the atmospheric pressure existing upon the surface of the water in the well, and which, in obedience to the laws of hydrostatics, forces the water up the suctiou pipe.

By the aid of a few simple equations, the theory of the operations we have just described will be perfectly apparent. If P represent the pressure of the atmosphere, which in round numbers is equal to 15lb. upon the square inch, and P' that in the interior of the pump, we have in the normal condition of equilibrium $P = P^1$. But directly the piston commences its stroke, and is lifted from the valve A, this equality is destroyed, and the pressure upon the surface of the water in the well exceeds that in the interior of the well, that is $P < P^1$. This equation determines the opening of the valve A, and may be correctly termed the limiting equation of the working of the pump. The upward force with which the flow of water takes place in the pump is equal to $P - P^1$, the value of P^1 becoming nearer to zero as the body of the pump becomes filled with water. Theoretically P^1 may be assumed equal to zero, and we should in this instance have the water forced upwards with a pressure equal to 15lb. per square inch. But, in practice, this limit is never reached, and the equation $P - P^1$ will always be less than the above amount. So soon as the water has filled the body of the pump, and the piston B upon its ascent lifts it a short distance to the discharging spout, the pressure undergoes an alteration in value. Although the principle of the lifting pump is involved in the action alluded to, yet the pump itself must not be confounded with that of a compound nature to be described presently. Assuming, therefore, the pump to be full of water, and the piston to be at about half stroke, the pressure upon its upper surface will be as follows :—Putting P, as before, for the atmospheric pressure, and W for the weight in pounds of the column of water lifted by it, then the pressure upon it equals $P^1 = (P + W)$. If we make the diameter of the piston in square inches equal to d, we may write $P^1 = \left(\frac{\pi d^2}{4} \times P\right) + W$. Substituting for P its numerical value, and for $\frac{\pi d^2}{4}$ its equivalent of $d^2 \times 0{\cdot}7854$, and bearing in mind that W equals the area of the piston in square inches, multiplied by the height in inches of the column of water, multiplied by the weight of a cubic inch of water, we have, making H equal to the height of the column, $P^1 = d^2 \times 0{\cdot}7854\ (15 + 0{\cdot}0361 \times H)$.

The practical question presenting itself is, to what height can we raise water by the suction pump? It has already been demonstrated that the upward flow of the water in the suction pipe and pump is due to the formation of a partial vacuum in the body of the pump, which destroys the equilibrium existing upon the free surface of the water in the well. The water, therefore, will rise so long as the vacuum is maintained, until its weight equals that of the force urging it upwards. In fig. 2 is represented a pipe dipping into water, in the upper portion of which a vacuum has been formed, and into which the water has risen as high as C, but no higher. By the formation of the vacuum the atmospheric pressure is taken off the surface of the water at the bottom of the pipe, and, consequently, as that pressure still exists at the upper surface, the fluid is forced up the pipe in the direction of the arm B, until the downward pressure, shown by the arm A, is equal to that exerted in the contrary direction. When this limit is reached the column will not rise any higher. This limiting height evidently depends upon the specific gravity of the fluid, and may easily be determined for water. There is also another circumstance affecting the height, and that is the actual pressure of the atmosphere, which varies, in

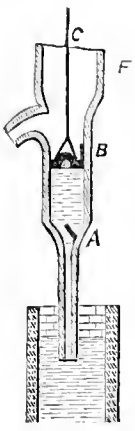

FIG. 1.

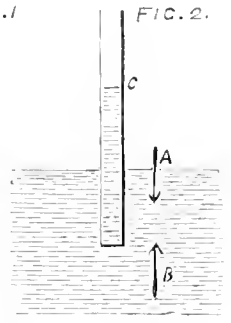

FIG. 2.

the extreme, between 29in. and 31in. of mercury in the barometer. It is, however, usually assumed to stand at 30in., and may be taken at 15lbs. per square inch of surface exposed to its action. The force urging the fluid—when it is water, whose specific gravity is unity—up the pipe is equal to the area of the pipe in square inches multiplied by 15lbs., or more correctly 14·75lbs. When the weight of the column of water standing in the tube above the level of that in the well or reservoir is equal to this force the maximum height will be attained, and no more will flow upwards. If H be this height in feet, the weight of the column will be the area of the pipe multiplied by $H \times 12 \times 0{\cdot}0361$, and the equations become $A \times 14{\cdot}75 = H \times A \times 12 \times 0{\cdot}0361$. Solving for H, we have $H = \frac{14.75}{0.4332} = 34.5$ ft., which is the greatest height to which water can be raised by the ordinary suction pump. It must, however, be remembered that this represents the theoretical value of H, or that which would be attained provided the valves, pistons, and other parts of the mechanism fitted perfectly tight, and that not the slightest leakage took place. Such perfection cannot be ensured in even the best mechanical agents, much less in machines so roughly and carelessly constructed as common pumps. Practically, the greatest height to which water can be raised by the application of this principle, is about 27ft. We must reserve for a future occasion an explanation of the action of the other descriptions of pumps.

GOSSIP FROM GLASGOW.

(From our Correspondent.)

In Glasgow, where everything else has its money value, architecture must be thought to be practised by its professors for its own sake, purely and simply, and not as a means towards such a prosaic end as bread-and-butter, for in a church competition presently in progress not only is no premium offered, but neither does the committee bind itself to accept any of the designs. When the clergyman preaches from the text, "The labourer is worthy of his hire," I shall certainly go to hear him.

Recent experiments with the "lime light" have failed to set the Clyde on fire. It is, however, expected that some difficulties will be shortly overcome, and then that this mode of illumination will be generally used in our large public places, such as Glasgow Green and the squares. Of the lime light a local newspaper, *The North British Daily Mail*, says "that although it is sometimes called 'the Drummond Light,' from Lieutenant Drummond, who in 1826 is said to have been the first who used it, it was really the invention, or rather a discovery, of a citizen of Glasgow—the late Mr. John Hart—a man whose merits the citizens never sufficiently appreciated."

The Portrait Exhibition has, at least as regards attendance, been anything but a success. In the first place, its interest is far from general; it commends itself chiefly to those of old Glasgow "family," and that very limited few who can compare Reynolds with Raeburn, and Gainsborough with Graham Gilbert; and, in the second place, as the price of admission was something like a prohibitory tariff, and as the hours were from nine till six, a suspicion arose that the Portrait Exhibition was not for the many, but that a gallery built expressly for the public's pictures was being usurped by a collection for solely the "upper ten." A more liberal scale is now being tried, but the effervescence having been taken off by "the quality," what remains for the people is found to be "stale, flat," and, I fear, "unprofitable."

The Improvement Act has progressed a stage, six "leading architects" having been invited by the Trust to plan the laying-out of the ground affected by the scheme. It is open to question whether for this special work the "leading" architects, those whose practice has been chiefly among churches, banks, and mansion-houses, are the right men in the right place, and whether the desiderated acquaintance with the wants and habits of the labourer and the artisan might not be more readily found in some humbler grade of the profession. It will be remembered that some of the "leading" architects expressed themselves in no very friendly way towards the Improvement Act, and if these be among the invited, it would be curious to know how they will dispose of the subject. I must mention that each is to receive fifty guineas for his services.

The Glasgow architects having failed to get a charter of incorporation, now propose some sort of local institute of ten pounds apiece and a guinea yearly subscription, one of its objects being the same as was intended by the charter—the raising the status of the profession. For this there is certainly ample room and verge enough.

We are now in daily expectation of the arrival of Foley's statue of Lord Clyde. The statue of the hero of Corunna, after having been upon its pedestal for forty-nine years, has been removed, and the foundations for that of the hero of the Crimea and India are being rapidly prepared. "Peace hath its victories no less renowned than war," and now that Glasgow has discharged a debt due to the memory of its two greatest soldiers, it may, perhaps, at least think of the claims of Thomas Campbell the poet, and Archibald Alison the historian. There is still a vacant corner or two in George-square.

The Corporation has taken the manure of the city into its own hands, and has consequently appointed an Inspector of Cleansing at a salary of £100 per annum to begin with. Apropos of cleansing, there was tried the other day a patented invention of Mr. Sim, late of Furnace Granite Quarries, by which it is proposed to cleanse and water the streets more efficaciously than is done at present, and also to save to the Corporation several thousand pounds a year. Mr. Sim's invention is a very simple one. He lays iron piping of about 3in. in diameter, and closely perforated, alongside the kerb of the footpath, and through these perforations water by gravitation pressure discharges a copious shower across the surface of the carriage-way. I do not know whether the piping is to be fixed or movable; but there seems to be no practical difficulty in the way of it being the former. What with an Improvement Act that straightens old streets and forms new thoroughfares, that sweeps out the birthplace of disease and crushes the cradle of crime, with a water supply unequalled in quantity and quality, a fortnightly new scheme for a system of sewage, new causey for its carriage-ways, and new pavement for its footpaths, lime-lighting for its lamps, and patent showers for its streets, Glasgow, despite a few slanders about habitual drunkenness and hypocritical Sabbatarianism, appears as if about to set up for a model city, and, with some present grumbling, to earn much future gratitude.

HOSPITALS.

At the last meeting of the Architectural Association the president, Mr. R. Phenè Spiers, in the chair, a paper on "Hospitals" was read by Mr. T. Roger Smith, of which the following is an abstract.

In choosing the subject of hospitals for his paper

Mr. Smith said he had specially in view its fitness as an example of special adaptation to a distinct purpose. There were, however, one or two collateral considerations contributing to the value of a hospital as an object of study. It was eminently a modern building. It held out before the eyes of architects a penalty against ignorance and carelessness, and a premium for knowledge and skill of a graver character than attached to almost any other work. Lastly, the subject was one on which some of the members present could not fail to be at some time practically engaged, and which therefore they might well desire to study from personal motives.

He would ask the members of the association to endeavour to look at his paper not merely as intended to convey information about hospitals, but also as including an endeavour to elucidate some of the conditions of special arrangement of buildings generally, taking hospitals as samples of what had to be done in every class structure and in fact in every separate design.

The peculiarly modern character of hospitals was worthy of a moment's notice. While examples of houses, theatres, baths, and places of worship abounded in the remains of classic times, there existed no remains of a Greek or Roman hospital. The simple and modest infirmary of a monastery was no example to us as to scale, and the vast establishments of the sixteenth and seventeenth centuries were of little value as specimens of arrangement and detail. It would therefore be to most recent examples that he should direct their attention.

Referring to the stimulus afforded to architects by the great interests at stake it was absolutely certain that if one hundred patients were treated in an ill-contrived hospital, and the same number in a thoroughly good one, many more would die in the bad building than in the good one. He could not give even a fair guess at relative numbers, but, place them at the very lowest and say that by good planning one life might be saved in each hundred, and one week's illness saved on the average to each patient, and we had a most powerful incentive to labour and study. Imagine an architect at 30 rebuilding a hospital of only sufficient capacity to accommodate 100 patients per annum. What a subject of recollection to him at the age of 70 to think of 40 human lives saved and 4,000 weeks, or more than 75 years, of human suffering saved through his instrumentality. On the other hand, if by carelessness and ignorance he had failed in his hospital what a large number of human lives had been lost in his lifetime only by his fault.

Thoroughly to grasp the subject it was well to group the requirements of a hospital under four heads or divisions, applying alike to the building and working of the institution. First, the inmates or patients—*i.e.*, the sick who were treated and resided in the house; secondly, the administration, embracing medical officers, dressers, sisters, nurses, attendants, cooking places, stores, business offices, &c.; thirdly, the out-patients, who came to the hospital periodically for advice and medicine, and the portions of the buildings where they were received and seen; fourthly, the medical school of students and professors, and their lecture rooms, library, museum, dissecting room, &c.

The most important parts of a hospital were, of course, the wards. Each patient had a separate bed, and for convenience of attendance it was usual to place from twenty to thirty beds in a ward, reserving a few small wards where only two or three beds were receivable for special cases. The most important provision for the sick which an architect can make is a plentiful supply of fresh air. There should be plenty of air, and it should constantly be changed and renewed. The best authorities consider that each bed should have from 1,500 to 2,000 cubic feet of air space, and that the change of air—while, of course, not sufficiently rapid to create a draft or breeze—should yet be sufficient to be felt as an air passing over the face and hands. The sick should not be so placed that the air, to reach any bed, must necessarily pass over any other; there must not only not be too many patients in one ward, but there must not be too many wards under one roof. Next to air, light and cheerfulness of aspect were conducive to health, and the easy supervision of the beds, and access to each side of the bed, and a clear passage up and down each ward, must be provided for. All these requirements were practically best met by wards that were long in proportion to their width, arranged so that one of the long sides shall have a southern aspect, with a row of beds at each side, placed with their heads to the wall, and a row of windows in each wall. A width of 25ft. across the ward was most useful: beyond 30ft. the ventilation became sluggish. The height of the ward should be 15ft. at least.

The best way of supplying fresh air was a subject upon which English and continental authorities differ. The best known and most followed English authorities agreed that the only reliable mode of ventilation was having windows facing each other on the two sides of each ward, and keeping them almost constantly open. This is termed natural ventilation. For this purpose hospital windows should have several casements, each hung at the bottom edge, and capable of opening back at the top, to throw the incoming air upwards. These casements should be capable of great nicety of regulation, so as to remain at whatever angle they were set. They should be glazed with thick plate-glass to diminish the loss of heat; or, better still, double glazed, with perforated zinc taking the place of some of the panes of glass. An appliance for keeping up a supply of fresh air warmed and moistened, and for drawing off foul air, ought also to form part of a hospital ward, and ought to be equal to keeping the wards thoroughly aired in frosty or stormy weather, at night, or at any other time when windows cannot safely be opened. Some such apparatus was now being made for St. Thomas's Hospital. Messrs. Haden had been consulted, and the proposed arrangement consisted of open fireplaces in the centre of the floor, with a vertical tubular flue passing from each up to the ceiling. An outer air tube round this would serve to carry off some considerable part of the vitiated air beyond what goes up the chimney with the smoke, which in all open fireplaces is always considerable. Not content with this the architect supplied four foul air extraction flues, which meet in the roofs, and near the outlet of which a current is kept up by a coil of hot water pipes, which, forming part of the hot water supply system, will be always at work. As an auxiliary for cold weather coils would be introduced on the floor, and the boiler for working them would be a separate one. Air inlets also would exist in the floor, one series bringing air to the neighbourhood of the stoves, another to the hot water coils, and when these are at work the supply drawn by these inlets will be warmed by passing over these coils. These arrangements would be all repeated in the several pavilions of the building, and would be quite separate and distinct from each other.

The ward should be so fitted and furnished as to harbour neither vermin nor infection. Wall paper and skirting boards must therefore of course be dispensed with, but there was also great risk of infection in the very material with which the faces of the ward were lined. Ordinary plaster was porous, so was soft wood. The floors should be of the hardest wood, such as oak—not tile, which is chilly to the feet—and should then be rubbed with bees wax and oil till all the pores are filled up, or else oiled and lacquered, as is the practice in Berlin, so as to render the surface smooth and hard. The walls and ceilings should be of the hardest obtainable material, Parian cement being the best for the purpose so far as surface goes and also being white, grey colouring cements being objectionable as looking dirty. For the heating of hospitals English authorities concurred in recommending open fires, either in ordinary fireplaces in the side walls of a ward, or in open fireplaces formed in some sort of stove, which ought to have earthenware surfaces, not iron, in the middle of the ward. The latter plan seemed to be gaining ground at the present day. It required of course a fire-proof construction of floor. The French frequently warmed their hospitals by hot air apparatus, but they thereby ran a risk of diminishing the advantages of their excellent arrangements in other respects.

Attached to each ward there should be one or two rooms for purposes of administration.

The sister or head nurse required a separate room with a window looking over the ward. This was best provided for at the end of the ward next adjoining the main buildings, and, excepting the window mentioned, would be like any ordinary room. A smaller room, called a ward scullery, with a fireplace, and hot and cold water laid on, and a sink, were also wanted. At the opposite end of the ward must be placed a group of closets and one or more baths and a lavatory. A cross current of air should constantly traverse the passage between the ward and the closets, to prevent any effluvia entering the ward, and each closet should have separate and direct ventilation. It was also desirable if practicable to retain an end window to the ward for cheerfulness' sake. The Leeds Infirmary and St. Thomas's Hospital were examples of perfect arrangement in this respect. A slop sink thoroughly trapped, and for men's wards an urinal, were also wanted. There should not be fewer closets than one to every ten patients. Somewhere near the ward, but not in it, there should be a small lift on which the patients' food could be conveyed from the kitchen corridor, and in each block of buildings a large lift should be provided capable of conveying a patient, his bed, and an attendant. It was also usual to provide a dust shaft and a foul linen shaft communicating from the outside of each ward with the basement.

Having now obtained a single ward, in what way were we to agglomerate a series of wards, so as to make of them one large institution? In the first place, we naturally placed them one above another, but, of course, there was a limit to this. Miss Nightingale firmly maintained that there ought to be but two storeys of wards under one roof, and this was the case at the Herbert Hospital. But partly from considerations of economy and partly from a feeling that the risk of infection vertically was not very great, it was frequently customary to place three, or even more, storeys of wards over each other. All agreed that it was inadvisable to place the sick on the level of the ground floor. The modes in which wards or blocks of wards have been arranged on plan were very various, but there appeared to be a general feeling that the best yet found out was the pavilion plan, or block system. Each pavilion was, in fact, one ward, with its appendages repeated as many times as there were storeys, and having its own independent staircase. It was isolated from its neighbours by a space which ought to be sufficient to keep it all day out of the shadow of the adjoining pavilions, so as to afford its windows all the sun and air they required. A usual plan was to make these pavilions grow out from two sides of a hollow square, and this was first practised in England—the earliest example, according to Horky, being the Hospital for Seamen, at Stonehouse, near Plymouth, built in 1764. The best known example was the Lariboisière Hospital, at Paris, commenced in 1839 and finished in 1854. The buildings of the Lariboisière were arranged round an oblong open quadrangle, and consisted of six pavilions for patients, three on each side, and of buildings for the administration, occupying four other pavilions at the four corners of the quadrangle, and closing up its two ends. The pavilions for the sick were three storeys high each, the corridor connecting them existing on the ground floor only; its roof forming on the first floor a kind of terrace. The wards, according to Horky, were about 21 metres, or about 68ft. 9in. apart, but each one was 18·3 metres to the ridge, and there was danger of their overshadowing each other. In Miss Nightingale's admirable "Notes on Hospitals," and in other standard works, other plans of arrangements would be found which were not necessary to be mentioned. The plan of the Blackburn Infirmary was, however, worth noticing as a very ingenious adaptation of the pavilion system, whereby great airiness and roomy space were secured between the wards, and yet the building was kept tolerably compact and the corridor of communication short.

Day rooms, convalescent rooms, a library, a chapel, and covered exercising ground, these, or some of them, were parts of most complete hospitals, but their use varied with the degree of severity of the diseases treated. None of these things were of much service to patients who were very ill.

Wards having been considered, the next thing was to provide for the administration. This was no trifle. The personal attendants on the sick, comprising sisters, nurses, and helpers, numbered, in a good hospital, one to every seven or eight patients, that was one-seventh or one-eighth as many as the patients. There would also be a certain number of persons engaged in household duties—some in the dispensary and stores, the superior nursing staff (in case any sisterhood looked after the hospital), the medical staff, and clerks—to be provided for. Bedrooms away from the wards were wanted for nurses when off duty. For the sister, provision was made, as before mentioned, in a room overlooking the ward. The

practice was reviving in this country of entrusting the care of the sick to sisterhoods, most of them being formed on the basis of religious orders, and most efficiently did these excellent women perform the work. In any hospital where a sisterhood was engaged a residence should be provided for them within the precincts of the hospital, detached as far as possible from all other parts of the building. The kitchen should receive special attention. It should be as central as possible, should be surrounded by stores, and easily accessible from without to tradesmen. A wine cellar and an ice-house should not be forgotten. Near this department of the hospital the residences of the steward or matron ought to be placed. A dispensary must also be provided in a central situation; this must be placed conveniently for out-patients. Linen stores and laundry required a department to themselves. A comptroller's offices, board room, and ante-room would be necessary adjuncts. For the medical staff sufficient preparation should be made. One or more residences must be provided for the house surgeon or other resident medical officer, and also accommodation for a certain number of dressers or clinical clerks. Easily accessible from the wards there must also be an operating theatre with a northerly top light; adjoining this a private surgeon's room and a small ward for patients who cannot be at once carried to their beds after an operation.

Out-patients should have a separate entrance into a hall from whence they should be passed by an attendant into the physician's or surgeon's room. This hall should be spacious and airy, as many persons were sometimes congregated in it. Each patient when seen should leave the medical room by a different door from that by which he entered, and should then be able to go to the dispensary to receive his medicine. The rooms of the physician and surgeon should of course communicate with a corridor leading to the interior of the hospital.

The medical school required a certain amount of provision to be made for it; lecture rooms, proper professors' rooms, a library, museum, one or more dissecting rooms, a dead house, and an inquest room were also needed.

Lastly, in connection with the school, it was in some cases customary, and always desirable, to provide near the hospital a building constructed in sets of chambers where a portion of the students might reside.

As to sites for hospitals, opinions differed. Miss Nightingale said unhesitatingly they should all be in the country. But this for many considerations was impossible. Certain it was that pure air and plenty of space should be primary considerations. A gravelly soil of a sufficient elevation was preferable. A bed of concrete over the whole site was recommended as a preventive against moisture. This had been done at St. Thomas's.

Having shown in detail the different units of which a great hospital is composed Mr. Smith proceeded to illustrate their harmonisation by references to the best known principal hospitals.

The typical modern hospital, as it had been considered by modern writers, was the Lariboisière. This building was planned round an oblong open quadrangle, with blocks of buildings in front and rear, and ten blocks arranged end on at the sides. Of these six only were for the sick. The front centre building was of one storey only in height. In its side blocks were the kitchen buildings on the left, and the pharmacy on the right. On the first floors of these blocks were quarters for the officers, and on the second floor apartments for pupils. Of the rear lateral blocks one had a laundry, store, and dormitories for female attendants; and the other contained sisters' rooms and stores. In the centre at the rear were the chapel, two operating theatres, bath-rooms, a stable, dead-houses, &c. This hospital was designed for 606 beds. The main defects appeared to be the small distances apart of the wards, and the position of the kitchen in one of the front blocks, as being very far from some of the wards. The same objection also applied to the two operating theatres in the rear.

The plan of the Herbert Military Hospital, Woolwich, was arranged much as though the whole quadrangle and lateral corridors of the Lariboisière had been omitted and the wards then brought together. Economy of construction and simplicity of working were thereby promoted. There were in this building seven blocks, the two next each extremity being double blocks, and the three in the centre less complete. The centre block included a day-room, library, and chapel. The blocks were hardly so far apart as at the Lariboisière, but then they were a storey lower. The kitchen was excellently well placed in the very centre of the building in the basement under the library. There were only two storeys of wards. The large wards held 32 beds each, and the building contained 620 beds in general hospital and 28 beds in the prison ward. The plans of this hospital were published in a small bluebook, and were very valuable as completely worked out examples.

The Leeds* Infirmary, designed by Mr. G. G. Scott, contained five blocks of wards—two double blocks placed end to end at the sides, like the end blocks of the Herbert Hospital, only with a gap between their ends on the top floor, and one single central block. These were arranged on opposite sides of a quadrangle, the corridors around which were only the height of one storey of wards. The position and arrangement of the blocks containing the latrines and baths deserved notice as fulfilling all the conditions of good ventilation, and as furnishing very picturesque features in the building. The way also in which the out-patients' and medical schools' department was kept out of the way of the in patients' hospital was extremely good. The chapel and operating theatres were on the first floor (the level of the lowest floor of wards). The kitchen on the lowest floor was very centrally placed. The walls and ceiling of the wards were of Parian cement.

The new St. Thomas's Hospital, now erecting from the designs of Mr. Currey, might be described, as far as ward arrangements go, as half the Lariboisière plan—that is, one main corridor with blocks projecting from it all on one side. A number of administrative buildings were clustered round the main corridor line on the ground floor, and occupied a considerable portion of the pavilions on that floor. This left six blocks for the patients, in two groups of three blocks each, with the chapel in the centre. There would be three storeys of wards, each 120ft. long by 28ft. wide, and 15ft. high, and containing twenty-eight beds, giving 1,800ft. of air to each patient. The appliances to each ward were unusually complete, including a kind of balcony overlooking the Thames. There was an excellent series of rooms for out-patients, and a distinct series for receiving and treating casualties not sufficiently serious to render the patient an inmate of the wards. The kitchen was very central, and a distinct building was proposed for the medical school. The total number of beds contemplated for this hospital was 588.

The Blackburn Infirmary showed another version of the pavilion plan with one corridor, but with the ingenious mode of shortening this corridor by throwing off the wards on either side.

As an example of simple plan and smaller design, Mr. Smith exhibited a plan of the European Hospital, at Bombay, designed by himself. This was a straight block of buildings, three storeys high, with a centre and two slightly accentuated ends. The ground storey throughout and the back of the centre of the block was occupied by rooms for administrative purposes. The wings were wards placed end to end, with baths and latrines in the blocks at the end, separated from the wards by an open space. The peculiar construction of the verandah (usual in all Indian buildings) to screen the wall rendered it possible to suppress the nurses' rooms, ward sculleries, &c., and to use portions of this verandah, Indian fashion, for those purposes. This hospital was for not quite 150 patients.

Of cottage hospitals a good example existed at East Grinstead. This description should be a good roomy cottage improved, or a homely but cheerful building like a cottage, put up on purpose, surrounded by a garden, and fitted for the occupation and treatment of a few poor cottagers, and with such surroundings as they were used to in their own homes.

Among the points of agreement in the various examples referred to it was noticed that none provides for more than six hundred beds or thereabouts, and it was stated that this was about the largest number that could be conveniently treated in one building. Those who desired further information on the subject would find it in the works of Miss Nightingale both in her "Notes on Hospitals," and in her "Notes on Nursing." In French there were by Husson, *Etude sur les Hopitaux*, and by Blondel and Ser *Rapport sur les Hopitaux civils de la Ville de Londres*. In German we had Horky, *Studien uber Kranken Anstalten*, and a work by Dr. Oppert.

* Illustrated and described in BUILDING NEWS of July 5, 1867 (No. 652).

From these works, but more especially from careful study of existing examples, much information could be gained. It must be remembered that in no branch of architectural practice was it of more importance to master every detail completely, and yet to combine the whole into a sagaciously considered and comprehensive design than when planning a hospital.

DISCUSSION.

Mr. HAYWARD, on being called upon by the president to speak, after proposing a vote of thanks to the lecturer, asked if all doctors and authorities were agreed in their opinions as to the best method of placing beds and wards. In all the hospitals described by Mr. Smith the rule appeared to be the same, except a slight difference in the construction of the windows. He thought it was remarkable that people seemed to have so made up their minds on the subject, and that while people were taking the present method to be undoubtedly correct there might possibly be yet a more perfect way. Another point that struck him was that the advantage claimed by some for cottage hospitals was more complete isolation. If this was really an advantage, was not the great elaboration of modern London hospitals a great mistake? He certainly thought medical men were in danger of going too far and getting more into their hands than they could manage.

Mr. BLASHILL, seconding the vote of thanks, said that while the great idea of modern hospitals seemed to be ventilation and cleanliness, he should like to ask Mr. Smith's opinion of the effect on the patients of the large amount of whitewash and the number of windows, both combining to admit and reflect so much light. Would not patients be hindered from sleeping, and if that was the case would it not retard their recovery?

A member said that in the case of patients being distressed by too much light he had seen used in hospitals a small head curtain, which while not interfering with the ventilation excluded the air. He should like to ask Mr. Smith's opinion of the general average cost per bed of the erection of any of the hospitals he had referred to.

Mr. LACY RIDGE said he believed that the Lariboisière Hospital, to which Mr. Smith had referred, had been found in practice to be anything but a model to be copied from, the deaths being very numerous owing to the practice of French doctors of keeping the windows shut and depending entirely on artificial ventilation. This he thought was a great argument in favour of the English system. He thought the old mediæval hospitals seemed to come much nearer perfection than any since erected. Concerning the architectural treatment of a hospital, in his opinion it was best to treat it as a building exclusively for the recovery and treatment of the sick, and not to attempt anything more.

Mr. RIDELL asked if Mr. Smith would give some information about the amount of gasfitting required in a hospital; whether, for instance, most of the night work was done by the nurses by the help of a hand lamp or candle.

Mr. SMITH, replying in order to the questions asked, said that while he thought the present system of placing beds in wards was the best, Mr. Hayward and the meeting were reminded that he had only attempted to describe things as they were in the most recent examples. He thought the probability was that hospitals were getting too elaborate, but great elaboration was the spirit of the times, and it would not do to run contrary to it. With regard to the ill effect of light, as had been already stated, a curtain was used where it proved hurtful. He was sorry he had not come prepared to give any reliable information as to the cost per bed of erection. In one example he knew the estimate had been £500 per bed, but he thought that was a very large amount. It was quite true that the deaths at the Lariboisière had been numerous, and from the cause assigned, insufficient natural ventilation. The amount of gasfitting required in a ward was not very great, one or two shaded gaslights for the sister or nurse being all that was requisite, lamps or candles being used by the nurses.

A very cordial vote of thanks was unanimously passed to the lecturer, which he briefly acknowledged, and the meeting terminated.

AN ARCHITECT'S DIFFICULTIES.

THE difficulties which architects have to contend against appear to be pretty much the same all the world over. Listen, for instance, to the following remarks made by Mr. Gilman, of

New York, before a meeting of the American Institute of Architects, a short time since. It may perhaps be thought, says Mr. Gilman, the bane of all art, that it is so dependent upon the public feeling,—that it flourishes not in proportion always to the degree of talent among its professors, but according to the degree of taste or sensibility for it among other classes of the community. But there can be no doubt that such is really the true state of the case. Particularly will it always be readily admitted by those who know anything of the public mind, that the public, as a body, too often, even the best of them, are very ill-informed in architecture. It is seldom that the means of patronage in their hands are accompanied by that knowledge or judgment which are so necessary to give value to that patronage. Hence it is that we are so often placed in that peculiarly trying position, of attempting to do our best before an uninformed and a perfectly irresponsible tribunal, when we know perfectly well, from the start, that the best is not what will be best appreciated,—in fact, not what is wanted,—and stands no possible chance of meeting with success. And herein lies, I think, the peculiar hardship, the anomalous and sometimes almost helpless position of the architect. The painter can retire to the privacy of the studio, and with his canvas and box of colours—certainly no expensive outfit—can paint what he pleases, according to his own fancy of the beautiful; as crazily sometimes, if you please, as his wildest whims can dictate; and somebody comes along and buys it; his nonsense, as King Charles said of the preacher, just hits their nonsense,—the crazier perhaps the better for the quality of the patrons,—and the finished picture is bought and taken away. Whether it ever ought to have been produced or not, is quite another question; but the completed picture is the end of the matter so far as he is concerned. It is all in the painter's own hands, the child of his own uncontrolled wishes, and he alone is responsible for it, from first to last. So with the sculptor, the impediments of tools and clay being in his case, perhaps, even of less account than the canvas and colours of the former. But when we come to the labours of the architect, how different, how infinitely more embarassing are the conditions? He can put nothing into the permanent form of a building,—can produce nothing that shall be seen and known and read of all men as his finished and completed work, except by the consent, with the co-operation, and at the expense—the large expense often—of other people. His work must be passed on before it is fairly begun, and stands no possible chance of ever coming to a successful beginning—in a permanent form, I mean—unless the people who are to pay have been all along previously conciliated. And you can readily understand that, should he have independence enough, or occupy a position strong enough to say from the start that he will design nothing, draw nothing, specify nothing, superintend nothing, put his hand to nothing but what he fully approves and what he knows beforehand is just the very best thing to be done, it would result, ninety-nine times in a hundred, in his being abandoned by his employers and the general public as in their view only a crotchety, impracticable, and conceited abstractionist. And it is my opinion, half a dozen such cases of professional self-assertion would render any one of us practically *hors du combat* for any important work for the balance of our natural lives. The late Sir Charles Barry, whom we all of us, I take it, look upon as a tolerably successful man in the profession, once remarked to me in speaking of Dr. Reid and his attempted ventilation of the Parliament buildings, with a warmth of feeling and an energy of expression which I never saw this most amiable man exhibit on any other subject: "The world," said he, "can never know, and nobody but a professional architect, perhaps, would ever believe, the amount of arrogance, of supercilious interference, of downright brutality even, that I have all along been subjected to in this matter. Forty times I have been on the point of throwing it up altogether, and had it not been for Lady Barry and my son, who have had little else to do but quiet me down at home, I should long ago have done so." I was sorry that I did not think to remind him of what I remembered not long after, of a letter of the Duke of Wellington, printed in Colonel Gurwood's edition of his letters and despatches. It was written to a young subaltern officer in India, the son of an old friend of the Duke, who contemplated throwing up his commission on account of some treatment he had received at the War Office. The veteran remonstrated with him, as nearly as I remember, in these effective terms: "You are dissatisfied with your treatment, and perhaps justly, but it is what we are all liable to in this world. The nation, doubtless, thinks me a man accustomed to have things pretty much as he likes, but I assure you, my young friend, that in thirty years of service, I have never had one single thing just as I wanted to have it. I have been obliged always to do the best I could under the circumstances."

Perhaps a fair illustration of the position of the architect in relation to his employers may be had by a comparison of it with that of the legal advocate. The lawyer, in conducting the management of a case, is compelled to take the facts as he finds them, and to do the best he can with the argument, under their admitted or proved relations. Could he have the power to make his own facts in every case just as he would like to have them, it would scarcely be granting him an easier task than what some architects appear to expect is going always to fall to their lot. The requirements of locality and convenience are one part of the facts of one class of cases which may often, it is true, admit of some ingenious modification at the hands of the architect, and perhaps greatly to the benefit of all concerned. But there is a second and often a harder class of facts to contend with, and this is the tastes, the wishes, often the fixed and unalterable resolutions of the employer; and just how to keep the line between what we know to be right and what he declares to be admissible, how—in the language of the compilers of the Book of Common Prayer—"to keep the mean between too much readiness in accepting and too much stiffness in refusing," this is the true *crux*, the veritable *pons asinorum*, which, when I confess myself to this day, and after three and twenty years of active practice, to be often sorely puzzled to cross with dignity, I know that I shall be by no means alone in the feeling in this assembly.

IRRIGATION IN INDIA.

ON the 21st ult., a paper was read on this subject before the Institution of Civil Engineers, by Mr. Allan Wilson. The author having had fourteen years' experience in India, was entitled to speak with authority on the subject.

The value of artificial means of irrigation for increasing the utility of the soil was recognised in India at an early date. In the Punjaub, canals for this purpose, as well as for navigation, were constructed as far back as the middle of the fourteenth century. But it was in the southern parts of India, where the rainfall was more precarious, and the river supplies less easily available, that the most extensive works were to be found. It had been estimated that, prior to the establishment of British rule, there were, in fourteen of the principal irrigated districts of the Madras Presidency, upwards of 43,000 tanks and channels in repair, besides about 10,000 out of repair, having, probably, 30,000 miles of embankments, and 300,000 separate masonry works. Some of these tanks and reservoirs were on an immense scale, for irrigating many thousand acres, while there were smaller tanks, wells, and springs, which watered only a few acres. It was remarkable that the Government should have allowed so many fine works gradually to fall into decay, without replacing them by others; as great natural facilities existed for storing water, and for forming canals to lead it on to the land. The irrigation works on the Godavery and Kisna rivers, in the northern Circars, and on the Coleroon, in Tanjore, have only recently been completed; but many large rivers were still allowed to flow into the ocean, almost unused for agricultural purposes.

With regard to the most general and least expensive mode of irrigation by means of artificial reservoirs, and to the methods adopted in forming such reservoirs, it was stated that in selecting a site it was essential to ascertain in the first place that the foundation was suitable; the next point to be determined was, the extent of land to be irrigated, and the quantity of water necessary for such irrigation. The area of the drainage or gathering grounds could be estimated from the trigonometrical survey maps of India, and the quantity of water that would pass into the tank during floods should be calculated according to the known rainfall, due allowance being made for absorption and evaporation. With these data, the dimensions of the different works could be fixed. It should, however, be borne in mind that depth of water was of greater importance than a large surface area, as the evaporation would be less in the former case. An examination should also be made of the valleys in the vicinity of the proposed reservoir, with a view to ascertain whether the surplus water flowing through the tank during floods could not be carried across intervening ridges, and be stored in natural basins at a small outlay, so as to fill a chain of tanks. It was explained that a tank was simply a reservoir formed by throwing an embankment, or bund as it was called in India, across a valley to dam up the drainage. The most simple description of bund was constructed entirely of earth, which was generally dug from the bed of the intended reservoir. The breadth at the top was usually about 12ft. The inner slope was 3 to 1, and this was faced with a pitching of loose stone, while the slope of the land side varied from 2 to 1 to 1 to 1. Puddle was seldom if ever used; indeed, it was not required, as owing to the lodgment of silt, a tank would puddle itself as soon as it had been once filled. In illustration of this fact it was mentioned that Major General Sir Arthur Cotten had stated that in a channel cut through loose sand, within a yard of the water's edge to a depth of 5ft., not the least moisture was found in the excavation; the lining of silt having rendered it completely watertight. In addition to this embankment some of the large Hindoo works had a massive retaining wall of masonry in front. Many of these walls were built of dressed stone, close jointed, backed with rubble and a rough description of concrete: and flights of steps of cut stone were constructed down to the edge of the water.

In order to draw off the water for cultivating the fields, each tank was provided with one or more sluices; their size and number depending entirely upon the area of land to be irrigated. The sluice in general use in Southern India was exceedingly simple. It was merely a tunnel through the bank, built of brick or rubble, either arched at the top or covered with flat stones, the floor being paved with flat-jointed flags, and the side walls lined with the same. The inner end, or head of the sluice or tunnel, was closed by stones, and the water was allowed to enter through one or more orifices, generally from 3in. to 5in. in diameter, cut in these covering stones. The flow of water through these orifices was regulated by means of conical plugs of wood, each of which being attached to a long handle could be withdrawn or inserted as required. At the end of the sluice tunnel, below the bank, a cistern was generally built, having its sides pierced with holes at different levels, to enable the water to be drawn off at various elevations. From this point the water was carried forward in open ducts of the requisite dimensions, in the sides of which subsidiary or distributing channels were cut, generally at the expense of the farmer, to lead the water on to the land to be irrigated. The mode of preparing land for wet cultivation was by laying it out in squares, rectangles, &c., each plot being separated from the rest by mud walls of sufficient height and thickness to prevent overflow or percolation. These squares or rectangles were kept level, and were as large as the nature of the ground would admit. When one was sufficiently flooded, the water was let off at the lower corner of the field into the next division, and so on until the whole area had been irrigated.

With a view of showing how favourable some parts of India were for forming reservoirs of large capacity, attention was directed to a design for a large artificial lake, which it was proposed to construct by damming up the gorge of a valley. This reservoir would be capable of storing sufficient water to irrigate 200 000 acres of land, an area equal to the county of Buckingham, allowing the usual average of 500 acres to the square mile as being under cultivation. Taking 170,000 acres as the extent of land to be irrigated for a single crop this would require provision to be made for the discharge of 170,000 cubic yards of water per hour at each end of the tank; and discussion was invited as to the best description of sluice for discharging such a vast volume of water.

On Saturday last the Sheffield Architectural and Archæological Society made their first excursion this season. They first proceeded to Conisbro' Church, which was examined. They then visited the old castle, where the Rev. J. Stacey read a paper on the building. They afterwards proceeded to Sprotborough, where the Rev. S. F. Surtees conducted the party over the fine old church. The party returned to Sheffield at ten o'clock at night after spending an interesting and instructive day.

THE LIBER STUDIORUM AND TECHNICAL EDUCATION.

IN these days of manufacturing art it is interesting, and may be useful, to remind the world of the existence of those very few things which yet bear the impress of the mind and hand of the artist. They are few in number, because time has been at work with them and destroying them, and the restorer in these modern days has been unfortunately yet more industriously and destructively at work in getting rid of all the evidences which they bore of individual artistic skill and labour. This last process has well nigh ruined every remnant of past art, while it is a certain and deplorable fact that, with but a very few exceptions, no modern art like the old—and produced in the like way—is being now brought into existence. There is, in short, no modern fine art in the real sense of the word, art *manufacture*, as I said before, having taken the place of it, the world receiving it as a substitute, not knowing the difference between them. It is not a little interesting, therefore, to note any exception, if there be any, to this now universal rule. *Cabinet painting* would seem to be the only thing in art which cannot be manufactured and disposed of as fine art, and made to pass current.

This very singular fact, unnoticed hitherto in our societies devoted to art and artists, makes everything connected with painting of high artistic interest; what would otherwise be but one thing out of many is raised by it into a thing *per se*. There is in the world of art nothing else like it. The drawings or paintings called the "Liber Studiorum," by Turner, become in this way unique, and make up a series of examples of personal and artistic power (for they are connected one with another) to be found nowhere else in the history of modern art. In this "Liber" Turner has endeavoured to represent Nature in a vast variety of aspects, and to show to the world what was never manifest before, that there is no aspect in Nature which is not worth simply representing and perpetuating. Considering the evil influences under which this great and original man was brought up, it seems truly wonderful how he came to do it—how he condescended to it. We have real reason to be thankful for this series of efforts to delineate Nature. It seems to me to have been a glorious accident, and a wonderful instance of how natural feeling and instinct can triumph sometimes over education and the pressure of the times. When these drawings were made any attempt to represent things as they are was looked upon with simple contempt, and one can hardly understand how anyone ever came to buy any of them. But there is a power in truth. A series of these drawings, which were at first published and sold for some twenty pounds, are now discovered to be worth a thousand.

But my object in asking for a little attention to these drawings at present is not to attempt to point out in detail their singular merits, but to remind the artistic reader and people in general that those wonderful performances were brought into being by a person who was wholly without "*technical education.*" This subject is now so fashionable, and sounds so learned, that it seems impossible to do otherwise than join in the general talk about it, for how can it be expected that our intelligent working man can compete with the foreigners, whether French or German, working in either metal or wood, without "technical education" to back him up? But what, some may perhaps say, is it to be technically educated? Why, shortly and simply, to be able to answer by *rote* almost any question, scientific or artistic, that may be put to you out of some book. Of either science or art as a matter of experience and practice you need to, and can, know nothing. It may, therefore, under these circumstances, be useful to venture a few practical remarks about it. I confine myself to *art* work.

First, in every old country there are always to be found in art matters *two* influences at work—the past and the present. In England at the present time there are not only the remains of the art proper to the country, and executed by those who have gone before us, as the cathedrals and churches, but museums and collections as well, full of art works of other countries, and executed by men of other races. There is, too, of course, the work now going on. Without "technical" and scientific art education, we are everywhere told, nothing can now be produced of any value, either scientific or artistic, by our present race of workmen and others practically engaged in the production of art. But let anyone consider this subject for a moment away from the hubbub and attend to *facts*.

It will not be denied that the value of the means of producing anything is best tested by the result. Let us, therefore, by way of example and comparison, instance three works certainly not yet surpassed anywhere *not* the results of *educated* artistic power—the Parthenon Frieze in the British Museum, the cartoons of Raphael at South Kensington, and the drawings from the Liber Studiorum, also at South Kensington. Nothing can be done without technical education. Now it is quite certain that the first of these productions, the Greek frieze, could not have been the result of art education as it is now understood, for it did not and could not exist. Phidias was not a scientifically educated man, nor was he acquainted with the history of art, and for myself I am quite sure that if he were in existence at this hour his acquirements would be looked down upon with sovereign contempt by our modern professors and art authorities. It could not be otherwise, for the means he had at his command and his mode of work, as evinced in the sculptures themselves, were nothing more or less than the objects before him, good eyesight, and a flexible hand, and he did his own work. He would not pass a third-class examination on the subject of the "Early History of the Helenic Race." Very many have been the attempts to copy and rival one of those frieze horses by our modern educated sculptors with the best of assistance, but without any success. This the London equestrian statues sufficiently prove.

We have been told but lately that Raphael lived all his life "like a lord," walked among kings and popes quite on a friendly and familiar footing, and must have been consequently a highly educated and deeply learned person. All that we now have to say about it is that the cartoons do not show anything of it. We have now before us a sketch from the "Slaughter of the Innocents," one of his most famous works, and a more ungentlemanly, unmannerly, unlearned production it would be hard to find, and quite certain it is that if this very painting were to be sent to the coming Royal Academy exhibition the "hanging committee" would not give it blank wall space. Yet let the reader go round the Academy rooms, make the most of the performances, and compare them (as evidences of art power) with but *one* of the groups from this drawing, *e.g.*, the mother screening the child. It will be quite enough, and he will soon discover that "technical education" has had nothing to do with it; nay, education, art education, *must* have destroyed it, and refuses to look at it. It is art power of the highest possible kind—but it is art education set at defiance. This man Raphael can certainly never be appealed to to show the value of education. Tested by education—modern education—these cartoons fail everywhere and utterly.

If the Greek marbles and the Raphael drawings show observing powers, common and simple, without either education or "enchantment," and set at nought the wisdom of modernism, what shall be said of Turner's "Liber" drawings? Here there is no past mystery, no human beings supposed to be deities, the spectator not knowing what he is looking at, no fancied scenes, but quite common scenes and places and occurrences—a corner of a farm yard, with a cart and horse, a mill, an opening in a forest, the sea, a river view, and so on. They were executed at a time in the life of the artist when he appears to have thought that, after all, there must be something in reality almost, if not quite, as good as an old black picture or a modern imitation of one. He copied bits of everything, says Mr. Ruskin, that could be found wherever he went—literally copied them as well as he could. No education whatever was needed to do this; it was the result of the simple power of being able to draw, and the consenting and condescending to copy. Turner seems to have begun his art life by innocently copying common things on the banks of the Thames, and without any sort of education. Of course he got in time to be artistically educated, and then imitated Claude Wilson and a number of others. The majority of the "Liber" drawings are in reality a protest against this very education—improved modern art education. He seems to say in them, "Now I am working in my own natural way without any surrounding help. This is how *I* see the nature before me." These "Liber" drawings are, to my mind, much greater works than his pictures, and are in reality to nature and landscape what the Greek frieze figures are to men and horses. It is the positive absence of artistic education that has rendered their production and existence possible. Turner cannot be appealed to as a proof of the necessity of educating a man, technically or otherwise. His greatest works were the results of his ignorance. How much more might be said about it; but my object is merely to show how little can be accomplished in these days towards the production of art by any process of education, as it is at present understood. Here we see the three greatest of England's possessions in the way of art produced by men on whom their education had no power artistically, and who did not, and could not, have had any technical education in our present sense of the term. They educated themselves. The great art want of the present day is not education, of which there is enough and more than enough, but the means of properly and fairly exhibiting the *results* of such education as the working artists of the time have. I say fairly because, as everybody connected with art knows, all our exhibitions are only for a few, and, what is far worse, those few are for the most part not the real producers of the works so exhibited, but "employers." To exhibit nowadays, no one need to draw, paint, or carve himself, as Phidias, and Raphael, and Turner did, but with a well-lined pocket to employ the labour of those who draw, or carve, or paint. This is the great modern art evil, and truly wonderful it is that no one is to be found to utter a protest against such a system as that now in such active operation. I do so because no one else does. No hope of anything better can ever be entertained till the time comes when those gifted with artistic power shall work with it themselves, and personally, and shall exhibit such productions in their own names; and until the public come to distinguish between manufactured and real art—between the art of such workmen as those I have named and the modern Mintons and glass-stainers—between the work to be yet seen in our cathedrals and in architectural exhibitions—this must precede education, and until it does no technical education can avail, even if conducted on the wisest of systems.

C. BRUCE ALLEN.

A new cemetery for the use of the Roman Catholics of Durham has just been completed. The site lies between the Bishop Auckland Branch Railway and the "Priors' Path," and the grounds have been tastefully laid out. The chapel and lodge have been erected from designs by Mr. C. H. Fowler, architect to the Dean and Chapter of Durham, and the total cost is about £600.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ON Monday next the annual meeting of this society will be held. The Institute was established in 1851, and since 1852 it has continued to increase in numbers and prosperity; and we find that during the last year a larger number of new members were elected than during any preceding year. The Institute now consists of 623 members, 262 being fellows, 14 honorary fellows, 10 honorary members, 78 honorary and corresponding members, 236 associates, 11 contributing visitors, 10 students, and 2 temporary students. During the past year the Institute has lost by death three fellows—namely, John H. Taylor, Thomas Cundy, and Charles Fowler; one honorary fellow—namely, Sir Robert Smirke; two associates—namely, C. J. Kelly and Charles Raggett; and one honorary member—namely, M. Faraday.

The report, of which we have received a copy, speaks of the re-election of Mr. Tite as president, after an interval of four years since he held the same office, and of his handsome donation of £500 towards the enrichment of the library. In competition for the medals and prizes offered by the Institute for 1867 an unusually good display of designs and drawings was submitted. The Pugin Travellership for the year was bestowed on Mr. C. Henman, jun., who distanced, by the excellence of his drawings and testimonials, eleven candidates for the honour; and the sum of £40, the proceeds of the Pugin Fund, was paid to Mr. H. Walker, who was appointed the travelling student for 1867. Mr. A. H. Layard, M.P., D.C.L., has received the gold medal for 1868. The board of examiners for candidates for certificates of competency to act as district surveyors have recommended ten out of sixteen who applied for the requisite authorisation. In order to secure a systematic method of preparing questions, and a regular attendance of a sufficient number of examiners on all occasions, three members of this board have been definitively appointed to undertake the duty. The council in their report regret that their efforts to establish voluntary architectural examination have met with scarcely any response from the younger members and students of the profession, only one member having presented himself for the ensuing examination. It is, however, intended to hold the examination. It is evident that unless a deeper interest is felt in this department of the Institute, the machinery for examination, which has been established with care, will be discontinued. As students do not appear to care for such examinations unless stirred to action by the hope of reward, it is, says the report, "worth consideration, whether the granting of some certificate would be desirable, in order to attract a greater number of applicants."

The committee for the conservation of ancient monuments and remains have continued their labours. As Mr. Beresford Hope intends to take public action in this matter, he requests members of the Institute and others to forward to him at once at 1, Connaught-place, Hyde Park, all the information they may possess on the subject of buildings remarkable for their historical or archæological interest, and in the custody of public departments. He solicits information on the name and situation of such building, its present condition, the probable date of its erection, the name and address of its owner, whether the building is occupied or otherwise, and whether it is accessible to the public.

The report glances at the doings of the Professional Practice Committee, at the competitions for the National Gallery and New Law Courts designs; at the Paris Exhibition committee, and congratulates those gentlemen connected with the Institute who succeeded in obtaining awards, and particularly Mr. Waterhouse, who obtained the grand prize; and the exploration of Jerusalem and the Holy Land, from which important results appertaining to the history, topography, and architectural antiquities of Palestine are expected. The council are also glad to be able to report that the financial condition of the Institute is satisfactory.

PAPERS READ BEFORE THE INSTITUTE.

The following are the titles of the papers read at the Ordinary General Meetings since the publication of the last annual report of the Institute:—

"On Chinese Architecture" by Dr. J. Lamprey, M.B., F.R.G.S., Surgeon H.M. 67th Regiment. "Remarks upon Grinling Gibbons as made to the Master of Trinity and A. J. B. Beresford Hope, Esq., M.P., in the Library of Trinity College, Cambridge, in November, 1866," by W. G. Rogers. "A Memoir of the late Sir Robert Smirke, R.A., &c., Honorary Fellow," by Edward Smirke, Esq. "A Memoir of the late Charles Fowler, Fellow," by Professor Donaldson, Fellow, Past-President, Honorary Secretary for Foreign Correspondence. "On the Relations of Geology with Architecture," by Professor Austed. "On the Photographs taken for the Architectural Photographic Association in the year 1867," by J. P. Seddon, Honorary Secretary. "On the Mural Decorations at the Mansion of Sir Walter Trevelyan, Bart., at Wallington, Northumberland," by W. B. Scott, Esq. "A description of the proposed School of Art at Bombay," by W. Burges, Fellow. "On Mural Paintings for Penkill Castle, Ayrshire," by W. B. Scott, Esq. "Communication descriptive of the Old Roof recently discovered over the Nave of West Church, Stirling, N.B." from J. M'Lean, Esq. "A Letter from M. THE GIANTS' STAIRCASE, VENICE.

OUR illustration this week is a double page lithograph of the Giants' Staircase and cortile at the Doge's Palace, Venice. This staircase derives its name from the two colossal statues of Mars and Neptune, by Sansorino, which stand on either side at its head. The whole structure is inlaid with the finest marbles very delicately worked, and the steps are inlaid in front with metal intarsiatura. It was on the platform at the summit of these steps the Doges were crowned.

THE EARTH SYSTEM.

ON Monday evening last, at the weekly meeting of the Social Science Association, a paper was read by Captain Fishborne, on the "Earth System." The paper alleged the usual objections to the water system, and dwelt upon the destruction of a quantity of valuable manure. Mr. Edwin Chadwick, C.B., was in the chair. Mr. Beggs took exception to the statements made in the paper, and contended that water-closets, when properly constructed, were the best means of conveying away from human habitations the excreta. It was the most economical, the most cleanly, the least offensive, and the most healthy mode; and the value of the excreta, when mixed with clay, was greatly exaggerated.

Dr. Hawksley spoke in favour of the earth system, and urged examples within his own experience of the evil effects of water-closets, and of the perfect inoffensiveness of the earth system.

Dr. Holland contended that the earth system was an entire fallacy, and that there was no reason why water-closets should not be made perfectly inoffensive. He also objected to the statements made as being entirely unfounded.

Mr. Robert Rawlinson, C.B., spoke on the same side in defence of a water-closet system when connected with drainage scientifically carried out. He said that he wished the advocates of the earth system every success in their experiment, but was sorry to find that they were building upon data which had no substantial foundation.

Several other gentlemen took part in the debate, and the chairman concluded by speaking in favour of the water system.

THE ALEXANDRA PALACE AND PARK.

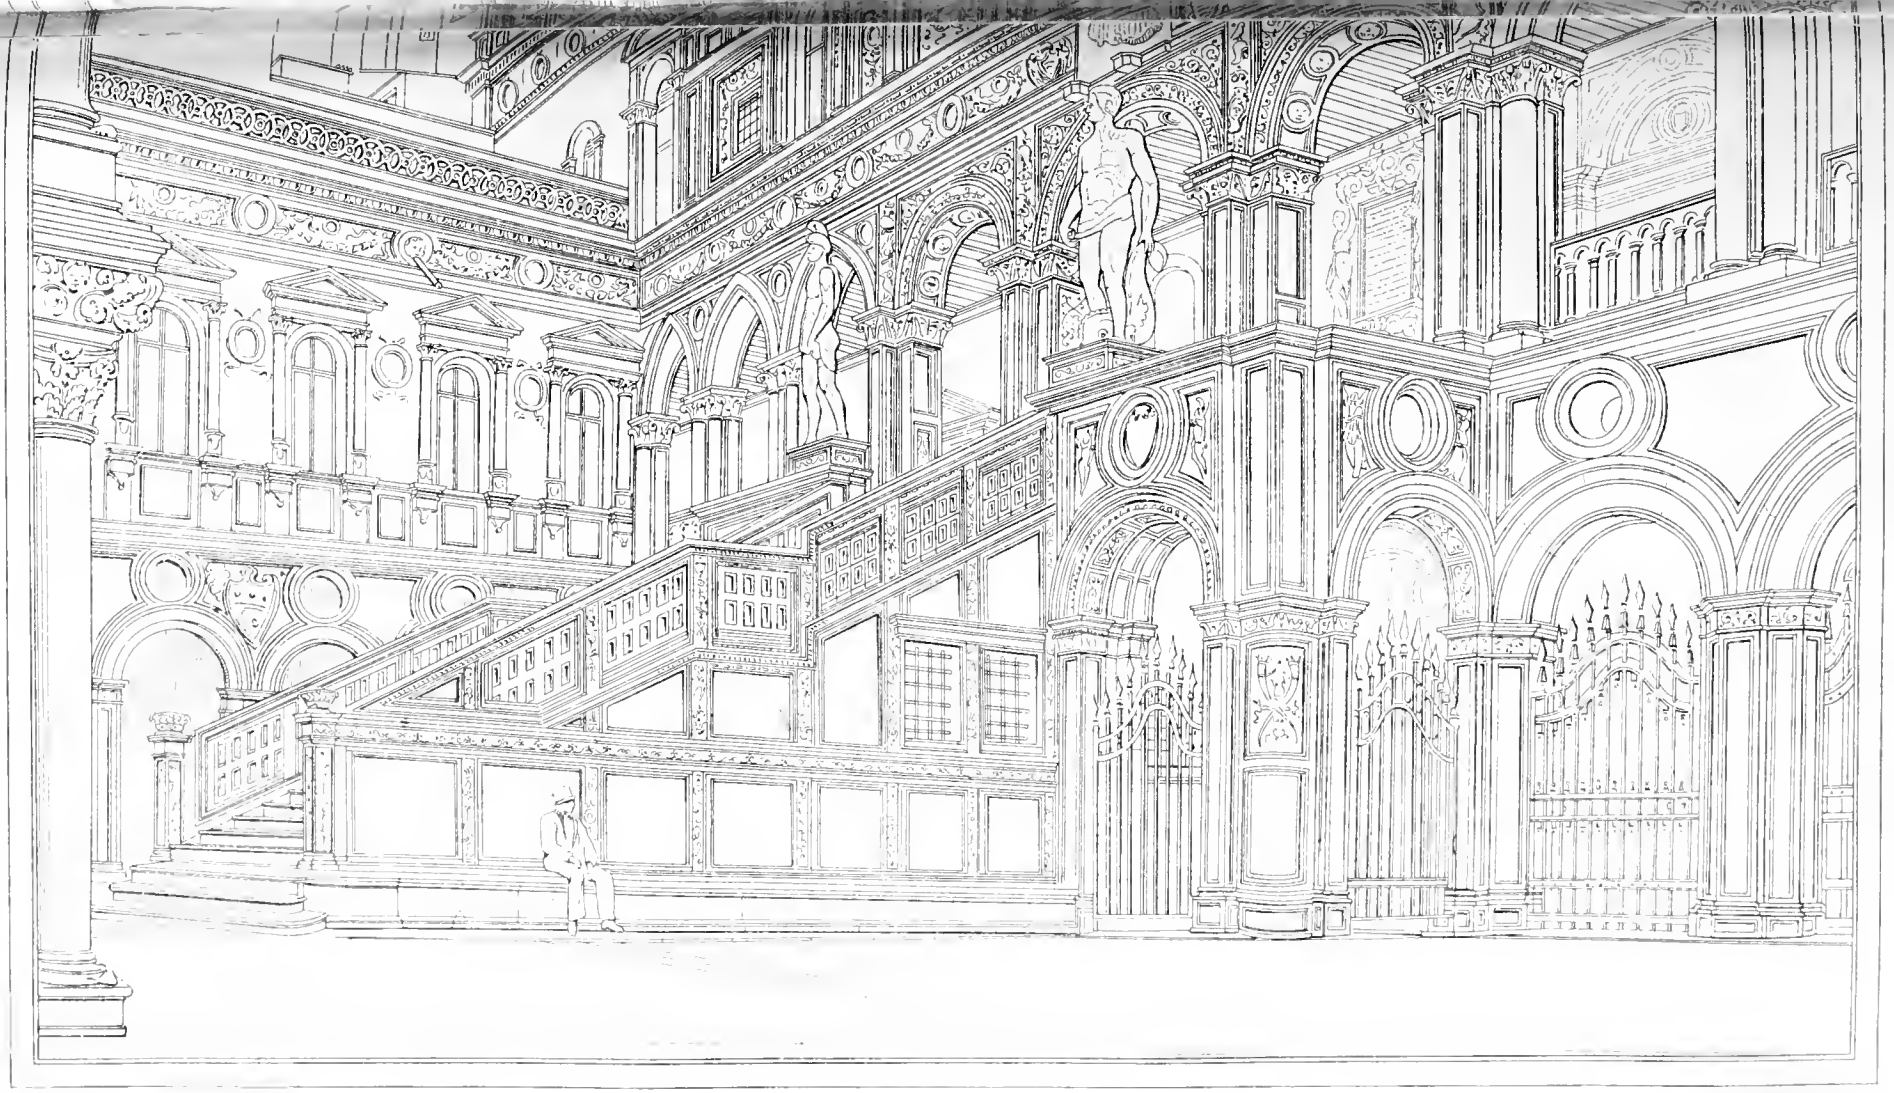
THE Alexandra Palace and Park are steadily approaching completion, and on Saturday last about 300 gentlemen, comprising many members of the literary and artistic professions, and others interested in the social welfare of the people, were invited by the directors on a visit of inspection. We think the directors have to congratulate themselves on the great natural beauty, not only of Muswell Hill itself, but also of the magnificent landscape which its elevated position commands. The park, which has been laid out by Mr. Mackenzie, is in good taste, and is really what it professes to be—a park, not merely a garden. The palace (of which we gave a description in the BUILDING NEWS of November 15, 1867) stands on the top of the hill, and is built in the Italian style, having a rather florid appearance, and presenting internally, from the amount of stained glass used, a somewhat ecclesiastical aspect. The decorations have been executed by Mr. Smith, and have a striking effect. Above the roof, in the centre of the building, rises a bold tambour, pierced with windows, from which springs a great dome, terminated at the top by a simple balustraded parapet and a standard mass 50ft. high. At all sides of the building are formed handsome and spacious terraces, on which and on the ornamental slopes adjoining them stand many large and handsome trees giving relief and effect to the building. The terrace on the north-west side is 1,000ft. long and 100ft. wide, supported by Italian arcades, and will cover a noble railway station, from which access will be had directly with the building at the ends of the three transepts, and to which all the railways of London will be ultimately brought. There will also be covered carriage entrances at the ends of the nave, communicating by an easy drive with the public roads.

A special feature of the Alexandra Park will be its race-course, which is now complete.

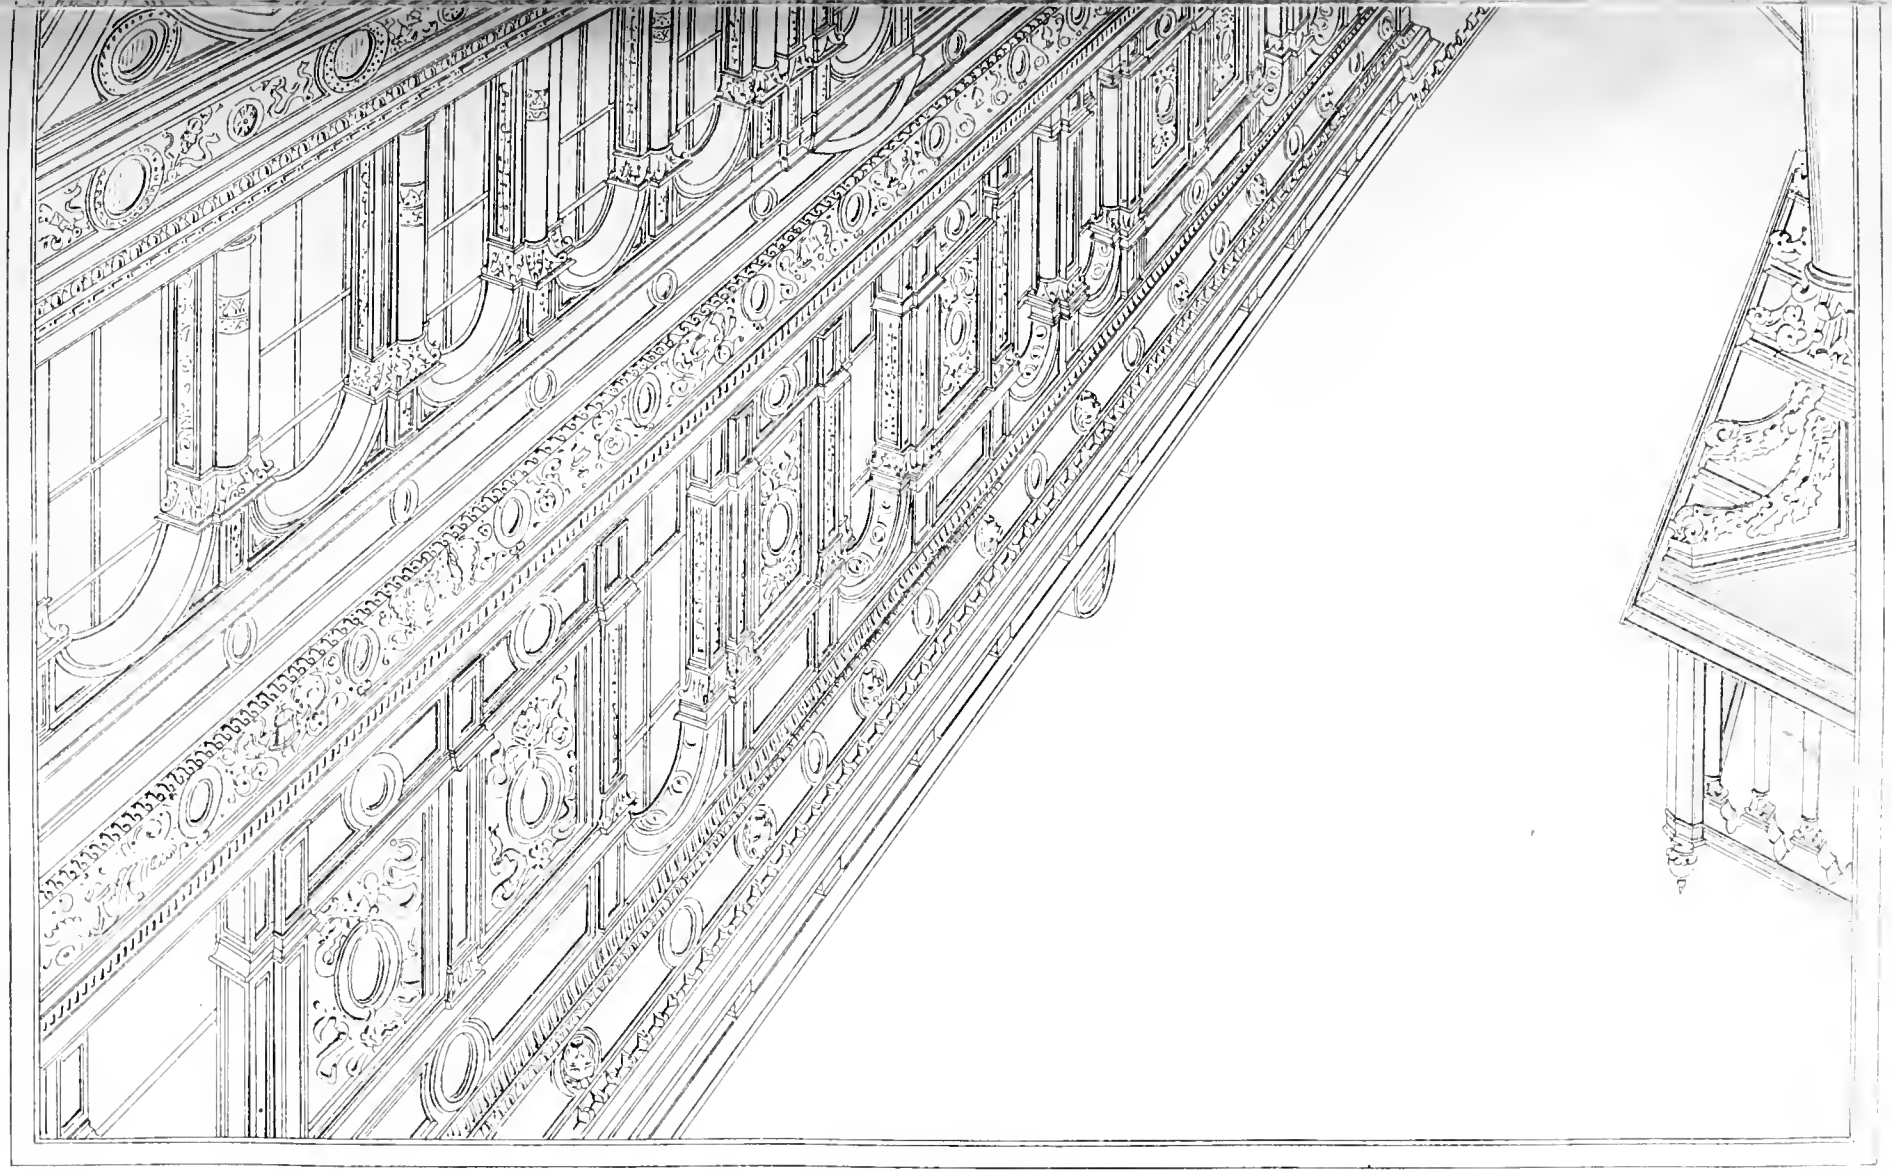
The "Muss Well," from which the hill derives its name, was in the olden time supposed to possess such valuable medicinal qualities that the Knights Hospitallers of Clerkenwell built a sanatorium in its vicinity. There is a tradition also that a Scottish king once came thither to be cured of some sore disease.

TUTBURY CHURCH.

CLOSE to the remains of Tutbury Castle—one of the oldest fortresses in Great Britain—stands the parish church, part of a magnificent Priory, built and richly endowed by Henry de Ferrers towards the close of the eleventh century. The original building, says Sir Oswald Mosley, in his history of Tutbury, with the cloisters, dormitories, and other apartments for the monks, covered three acres of ground. The massive columns which separate the nave from the north and south aisles, the lofty arch at the east end, and especially the west front, with its grand Norman doorway and window, sufficiently show how noble a piece of architecture this originally was; and, indeed, few finer specimens of the Norman style of ecclesiastical architecture are to be found in the kingdom. The south aisle is Gothic, and less massive than the nave; and Sir Oswald supposes that it was erected at the end of the thirteenth century by the first two Earls of Lancaster, who succeeded to the Tutbury estates after they became forfeited by the rebellion of Robert de Ferrers, last of the Earls of Derby, and during which troublous period the building probably suffered severely. The Priory, then greatly reduced in value, was dissolved in the reign of Henry VIII.; and the site was granted by Queen Elizabeth to the Earl of Lincoln, and was in the same reign acquired by Sir William Cavendish, ancestor of the Dukes of Devonshire, who pulled down the greater part, erecting with the materials a house in Tutbury for his eldest son. The nave and south aisle were, however, left for a parish church. The north aisle was built about forty years ago, when the church was re-pewed. The church had, however, no chancel, but this want has just been supplied by the munificence of the patron, Sir Oswald Mosley, Bart. It is built of stone in the Early English style, is circular in form, with a dome roof. There are a sedilia and piscina on the south side, with marble columns and richly ornamented caps. In addition to the erection of the chancel, the nave has been restored, and the roof raised to its original pitch. The whole of the work has been executed by Messrs. Critchlow and Ward, of Uttoxeter. Mr. G. E. Street is the architect.



View of the Giants' Staircase and Cortile at the Doge's Palace, Venice. — Drawn by Wm Perdue.



THE AMALGAMATED SOCIETY OF CARPENTERS AND JOINERS.

THIS society was established in 1860, and from that date it has made a certain and rapid progress. In December, 1860, it consisted of 20 branches, 608 members, and had funds in hand to the extent of £321. In December, 1867, it consisted of 203 branches, 8,022 members, and its funds in hand amounted to £15,153. Owing to the depression of trade, and also, no doubt, to the ordeal through which trades unions have had to pass during the past twelve months and more, the Amalgamated Society of Carpenters and Joiners has not made such a marked progress, and particularly as to augmentation of numbers, as during the preceding six years of its existence. But it is stronger in number, funds, and strength of organisation now than it ever was before. This may be a disagreeable fact for many to hear, but it is nevertheless true. It shows that trades unions are not going down; that they are neither diminishing in numbers or efficiency, but that in the face of unpopularity they are maintaining their position and even increasing in strength.

It is when we come to the ways and means of this society that we see the remarkable power of organisation, the economical arrangement, and the minute accuracy, by which the proceedings of some of the chief trades unions are conducted. The report before us is a triumphant vindication of the ability of the working classes to manage their own affairs. Let anyone compare this report with the report of any insurance society in the city of London, and he will find that the workmen are not only good financiers, but economical in their expenditure and honest in their dealings. A true history of the joint stock companies of the city of London, which have in ninety-nine cases out of a hundred been originated and administered by what is called the middle class, is a history of intrigue, and in too many cases of fraud and corruption. It is frequently very difficult to ascertain where the money expended is gone, and who is responsible for its malappropriation. In the report before us there is a record of the expenditure of every farthing; and, though there are 203 societies, numbering 8,022 members, all of whom are in vital communion with the central society, and though there are a variety of channels through which the funds of the society pass, still the appropriation of every penny can be traced with ease. Every item is tabulated with accuracy and will bear microscopic investigation. It will be seen on reference to Table 2 the expenditure for the various benefits connected with the society during the year has been as follows:—Donations, £5,270; tool benefit, £524: sick benefit, £3,271; funerals, £581; accidents, £200; superannuation, £16; trade privileges, £1,818; benevolent grants, £308; grants and loans to other trades, £103. The whole expenditure during the past year amounted to £16,144, and the income to £18,245. The balance of £2,101 is added to the funds in hand. It is evident from this report that trades unions are not decaying, that working men possess remarkable business ability, that they are on the whole free and frank in their dealings one with the other, that the policy of strikes is not the principal object these unions pursue, and that they are the means of diminishing distress, mitigating suffering, and "lightening the lot of labour." Strikes, which are often resorted to with rashness, and the intimidation which has too frequently accompanied and disgraced them, have brought trades unions into disrepute, but reasonable men should not forget that these unions are also benefit societies.

A very strong metallic cement is formed when a mixture of equal parts of oxide of zinc, sulphate of lead, peroxide of manganese, and oxide of iron is made into a paste of proper consistence with boiled linseed oil.

BUILDINGS FOR EUROPEAN OCCUPATION IN TROPICAL CLIMATES, ESPECIALLY INDIA.*

THERE exists nothing of a physical nature which causes so entire a revolution in our feelings and habits, in ourselves, and our surroundings, as the addition or withdrawal of a few degrees of heat; and if we look to climates which lie at the extreme limits of human endurance, either of heat or cold, we find almost every condition of life reversed. So many hot countries are connected with this country, either by commerce or colonisation, that from time to time English architects are called upon to design buildings for erection within their limits. It is, therefore, our business to consider the differences between such buildings as suit our climate and those which are adapted for the tropics, and to notice some of the peculiarities affecting the actual erection of the buildings, and the most obvious of the difficulties to be apprehended.

It may provoke a smile to say that the great peculiarity of a tropical climate is that it is very hot there; nevertheless, that is the great peculiarity, and the one an architect must never forget, remembering that even the cold season is hotter than our summer. It is also very light in such a climate, and at some period of the year it is further very wet. Climatic disturbances, such as wind-storms, dust-storms, thunder-storms, and possibly earthquakes, must be expected occasionally, and such disturbances are more sudden in their visits and more violent in their force than with us. Household pests there include such formidable enemies as the cobra, the scorpion, and the white ant, the latter of which is an enemy of the most destructive powers. The essential oils of teak and blackwood seem to protect them, but all ordinary wood is liable to be eaten by this ant. The damp of the monsoon time is another destructive agent, any unpainted or ungalvanised surface of iron being oxidised by it to a considerable extent; and either from this or the saline particles in the air, or the extra actinic power in the sunlight, the climate of Bombay, though free from frost, acts as injuriously on building stone as that of London. The people again are different. The servants, nearly all natives and of various castes, will dispense with many things wanted by Europeans; but, again, will require some things that in Europe would not be thought of. The workmen will also differ from ours in their ideas of workmanship, accuracy, and finish. Their setting out will be defective to an European eye, yet if the right sort of men be obtained and employed in the right way, their ornamental work will be very beautiful. The joinery and cabinet-work especially, executed with very rough tools, and put together without glue, will surpass most English work for solidity and durability.

It is almost self-evident that rooms in such a climate should be large and airy, windows and doors opening so as to admit every breeze of air, yet shaded to keep out the light and heat as much as possible. Outside the external walls a verandah is necessary; and is, in fact, the leading feature of a building for the tropics. This, where practicable, had better be of masonry, and of course as many storeys high as the building. The floors of the verandah should be water-tight and slope away from the building. The verandah affords a fine opportunity for external architecture, and in some of the more artistic native houses it is beautifully treated in carved wood. Allied to it, in the best Mahometan work, are corbelled balconies and open oriels thrown out to catch the breeze and afford a cool evening nook. Behind the shelter of the verandah the doors and windows should be spacious, and made so as to catch the prevalent breeze. The rooms should be arranged *en suite* from side to side and openings opposite openings, that the wind may blow quite through it, having windows opening down to the floor and doors placed opposite windows, both being made wide and high. The general plan should be compact and roomy. All servants residing apart and few stores being kept in any house, buildings and residences are relieved from all necessity of complicated arrangement. Over this simple mass a simple roof should be thrown. If not a terrace its pitch should be flat and its eaves overhanging, so as to give most shadow, and throw the heavy tropical rains off the foot of the wall. Flat roofs are the rule; the dome also forms a leading feature of many oriental buildings. The ordinary height of a storey is 18ft. or 20ft., and buildings of many storeys are uncommon. An underground basement is not usual, the ground floor being generally 2ft. to 3ft. above the surrounding level, and raised on a solid terrace. Between the top storey and the roof there should be a space well ventilated, and unoccupied to keep the top storey cool. No fireplaces or chimneys are ordinarily required, and kitchens ought to be built apart from the house. The ordinary window is a large casement hung folding, and each fold in two flaps, divided into several heights, and filled with louvres, like those of a Venetian blind, only finer, and capable of being set close or open.

The water closet system has never been established in India, and would probably not be found available, while Moule's earth-closet system would not obviate the necessity of removing more or less frequently the fecal matter by hand. This is done at present by sweepers, who, from the lowness of their caste must not come into contact with other servants, and therefore an external staircase leading to the verandah, and so along to each dressing-room, has to be provided, and often several such. Eaves, drain pipes, gutters, and means of storing rainwater, do not seem to exist. All houses and most public buildings require a carriage porch sheltered from the wet of the monsoon and the heat of the other seasons, and also stabling and coach-houses.

Wherever practicable an Indian building is placed within an ample walled enclosure called a compound, a compromise between meadow, orchard, and garden, and in this compound are settled the attendants' huts. These dwellings and the stables should be arranged so as not to come to windward of the buildings they belong to, on account of the bad smells likely to arise from them.

We now come to the structural difficulties mainly to be apprehended, which may be summed up in one general term—*want of appliances*. A building in progress is a strangely uncouth sight to European eyes. The scaffolding seems insecure, and only fitted to fall, yet does its work; vast crowds of half-naked workpeople—those carrying burdens being mostly women—each bearing on her head a light load; the mason squatting on the stone he has to dress, holding his chisel in the tips of his finger, and dealing dainty taps with a small hammer; the smith squatting over his fire, as though his feet must be among the sparks and cinders as well as his iron; and among them all the dusky overseer in his long white robes and an enormous red turban. On such a work as this the introduction of machinery of any kind would be an almost insuperable difficulty; in short, in designing for the tropics, the architect should suppose that his work is to be carried out almost as in mediæval times, and without any modern appliances whatever.

As a specimen of materials an account is given of what is obtainable at Bombay—a very favourable specimen of an Indian city. The island being volcanic, no stratified stone seem obtainable there or for many miles round. The ordinary building stone is a hard, rough slate coloured basaltic trap, quarried with difficulty used in stones of small size as rubble, laid with plenty of mortar, and plastered externally. For dressings and ashlar there is Coorla stone, very difficult to procure in large blocks, hard, and unyielding; and Porebunder stone, a brownish granular limestone, resembling the worst Bath stone. This latter is imported from a distance, is liable to discolouration, and is very costly. Native bricks are dear, small, thin and mostly defective. A coarse material called Kurial, a species of coral, is used for filling in. Gravel there is none, and the sea sand at Bombay is not siliceous, being ground up basalt rounded by the action of the water. Cement, where required, has to be imported from England. Lime and timber are the only two good materials for building to be found. In all joinery recourse is had to one material, teak timber, which is very tough and strong, and can be got in great scantlings. It is hard to work, but has three cardinal virtues: the ants do not eat it, the rain does not rot it, and when seasoned in India the sun does not warp it. The native tiles are an exceedingly bad roof covering; they are almost semi-cylindrical in section and about 9in. or 10in. long. They are laid fourfold in thickness, and, except at the eaves course, quite loose on the roofs: consequently a relaying of them, called

---

* Abstract of a paper read before the Royal Institute of British Architects, April 27, 1868, by T. ROGER SMITH, Esq., F.R.I.B.A.

tile-turning, is an annual preparation for the rainy reason. Galvanized corrugated iron, though not well suited to the climate, is an improvement. It ought to be used double, with an air space of 10in. or 12in., well ventilated.

All ironmongery must be of brass to withstand the damp of the monsoon season, and, if it is to act at all as Europeans like hinges and latches to act, it must be brought from Europe: so must window-glass, and marble or tile pavement.

Dennett's arch used in connection with Phillip's girder and Ransome's artificial stone seems appropriate for use in tropical cities, but they are little available in Bombay, owing to the absence of gravel or any other suitable substitute. Plumber's work is all but unknown in Bombay. Gas-fitting, however, has been lately introduced.

The available modes of carrying out a building are as at home either by contractors, or by engaging labour and buying materials. Native contractors are to be found in almost all Asiatic towns, and in many places English and American contractors are to be met with. The documents sent out by the architect need not be translated into any foreign language, as good English, if free from technical terms, is understood by all native contractors. Drawings should be full and clear. Simple bills of quantities will ordinarily be valuable, but they should not be taken much in detail. If the work is for any colonial government, the probability is very great that it will be handed over to an officer of Royal Engineers to carry out by day labour, or, as it is officially termed in India, departmentally. In this case the great evil which the architect has to fear, and if possible to guard against, is his work being wholly or in part modified, set aside, or superseded. To prevent this precautions should be taken, first, of being quite sure that there is nothing which will require necessarily to be set aside as unsuited to the climate, to the local materials, or to rude and imperfect workmanship and means of execution; secondly, that there is nothing to be added to the plans; and, thirdly, all the documents should be in the form customarily used and understood by the engineers, especially the detailed estimates. Lastly, no opportunity should be omitted of getting any official sanction and mark in the shape of seals or signatures on the drawings or such official memoranda in their favour as can by hook or by crook be obtained.

The Bombay Government has officially recognised the scale of professional charges issued by the Institute, but there is no doubt that in the case of architects practising and residing in India these rates ought to be increased, as it is customary for members of other professions to charge double the English fee for their services.

There still remains the ultimate question, and the most purely architectural question of all. What aspect as works of art shall we as artists strive to impress upon the buildings whose arrangement and construction we have considered? The solution of the question lies, first, in the adoption of a type essentially European; and, secondly, in the retention and blending with it of such admissible features as are to be found in the best styles already elaborated in tropical climates. Had we a distinctive modern English style we ought to use it in our colonies, as did the Romans in theirs, with such changes only as local circumstances necessitated. Though this is denied, as there exist distinctive European styles, and as our administration exhibits European justice, order, love of law, energy, and honour, so our buildings should hold up a high standard of European art. Most of our eastern work is not creditable to our taste. The proper corrective is, not the direct imitation of Asiatic types, but the adoption of European styles born in sunshiny regions, such as ancient Roman or Greek, the Renaissance and Gothic of Southern Italy or Spain, or the early Gothic of Southern France. In treating these, and still more in any northerly modifications of them, a leaning to the peculiarities of the best Oriental styles is desirable. Amongst these peculiarities are walls of ample thickness, often covered with a profusion of delicate surface ornament, frequently beautifully coloured; an absence of such vertical breaks as buttresses, and a prevalence of horizontal cornices and level projections; openings, usually wide and frequent, artistically grouped and often filled in with exquisite pierced patterns; mouldings infrequent; balconies and various sorts of corbellings, covered usually with carving; roofs of low pitch, flat or domical; walls, often replaced by lines of piers or columns; structures for the most part of moderate height, but of great extent and elaborate surroundings. All these have an aspect of breadth, richness, and shade.

These peculiarities may be found perfectly worked out in the best of the Mahometan buildings, which mark, as ours should do, the presence in India of a conquering race—a race, alas! far more artistic than we, and whose works are nobler monuments of art than it can be hoped ours may be. Many of these works are partly represented by the aid of photography, and are so available for study, and if, in addition to affording such information as at least a few of our members may find useful and interesting, I shall have succeeded in inducing architectural students to dig in this hitherto all but unexplored mine, I shall have the gratification of knowing that this paper has not been quite barren of results.

THE GROWTH OF LIVERPOOL.

THE fortnightly meeting of the Architectural and Archæological Society was held on the 15th inst. at the Royal Institution, Colquitt-street, Mr. Kilpin, the president, in the chair. Mr. H. H. Vale presented a magnificent photographic album to the society, for which he received a vote of thanks, passed by acclamation.

Mr. Samuel Huggins then read the paper of the evening, which was entitled "The Growth of Liverpool and its Architectural Results." The rapid growth of Liverpool, he said, had been among the marvels of the present age; perhaps it was as unrivalled as regarded the quality of the material which, in the course of its enlargement, had entered into its composition. While the old or business part of the town had undergone one continued process of improvement in architectural character, the private department, or that devoted to residences, had retrograded. The extension of Liverpool in every direction had been mainly by the erection of dwellings for the poorer classes of people, and this had been left for the most part to men profoundly ignorant of art, and with scarcely an idea in their heads: and the consequence was that art in these productions had not only been ignored, but a degree of meanness and wretchedness had extended over wide districts of this town that could scarcely have been deemed possible by those who had seen its pristine beauty. But he should not have brought this matter forward but for the conviction that these things had been growing worse of late, and that at no former period had such houses been built as were then obtruding themselves on the pleasantest and most respectable neighbourhoods. Assuredly a more melancholy contrast was never presented in architecture than was then presented between the character and quality of the buildings they were pulling down and those they were rearing. He was quite sure the New Zealanders would build for themselves, with the same means and materials at command, more pleasant-looking, less heart-sickening habitations than those now rearing in many parts of the town, which appeared to him more like a superior class of pigstye than abodes of humanity. The destruction was not confined to one locality. Every beautiful and retired spot of private residence, in whatever direction in the town, north, east, or south, was in course of destruction; and there was not a private house or neighbourhood anywhere but was in danger of being at any moment rendered valueless for private and genteel abode, not by the erection of small houses, but of ill-built houses. He had little hope of any effectual remedy for the evil being forthcoming. A new building act might do something, but nothing less than the extension of legal protection to certain neighbourhoods would be effectual—protection by laws, which would be no more inimical to the proper and rational liberty of the subject than those that were enacted against theft. The remedy he mentioned had not and probably would not for some time be applied, owing to the indifference to architecture that everywhere prevailed, and was operating prejudicially on most of our towns and cities. A striking instance was seen of it at Chester, which had lately exchanged some of its characteristic and best Italian buildings for the most entire abortions that ever insulted the eye. Even the cathedral itself was in danger at least of serious injury, and had been already roughly handled by the new dean in the course of carrying out some new arrangements for the public services. Dr. Howson would, he had no doubt, in other ways do honour to his new appointment and to the church; but, from what had already occurred, the friends of art had reason to tremble for the material church in such hands. It was under the impression that it was the duty of all who felt this to raise their voice in the matter that he now ventured a word in behalf of the venerable pile, the nave of which, hitherto unbroken by bench or pew, was dotted all over with a myriad of little bedroom chairs of the meanest and slimmest description, furnished by the maker, he was told, at 1s. 9d. apiece. There was talk of restoring the cathedral, which to the ear of an artist simply meant destroying—destroying its antiquarian and historic interest and picturesque beauty. The most important operation in the central or business part of Liverpool was the erection of the new Exchange-buildings. In a former notice of this work he had condemned it for being dissimilar in style from the old one, and so departing from that of the Townhall. But on a walk round it the other evening he was glad to perceive an advantage resulting from this which had escaped him before—namely, that it had caused it to become one with the chief buildings around it, uniting several hitherto dissevered blocks of commercial buildings into one continuous series. It united, for instance, Mr. Cockerell's block on the east of it with Messrs. Picton and Son's on the west, and so on of others at the northern extremities, till there would, when it was finished, be a complete district of fine commercial buildings, all in perfect accord, and unmistakably commercial in character, that he believed the metropolis only could parallel in this country. The monument of Nelson was greatly improved by being brought nearer to the Townhall, and it would be by being elevated had the basement retained its unbroken solidity. The widening of Church-street was an improvement worthy of the cost, whatever that might be. It was to be hoped the future new buildings in it would be the better for the example set them on the opposite side by the renewed Compton House, which it was only just to say was an excellent specimen of shop or commercial architecture carried to the utmost legitimate extent of the stately in character. The demolition of the railway façade was, for obvious reasons, not to be regretted. If the Wellington column could have been included in the scheme of destruction it would have been so much more satisfactory. He would venture to say there was not among the relics of the ninth or tenth centuries, in the darkest corner of Europe, an object more truly barbarous than that column. It was to be hoped that the north end of the fine area next the library would ere long be completed by the proposed new fine art gallery, one object of which was to wipe off the disgrace to Liverpool of being without the refining influence of an annual exhibition of pictures.

A discussion followed the reading of the paper, and at the close a vote of thanks was passed to Mr. Huggins.

ROYAL INSTITUTE OF ARCHITECTS.

THE ordinary general meeting of the members of the Institute was held at Conduit-street on Monday, under the presidency of Mr. W. Tite, M.P. The Royal gold medal for the year 1868 was awarded to Mr. A. H. Layard, M.P., and the following prizes and medals, submitted for competition in 1867, were also awarded:—The Soane medallion, for the best design for a townhall, to Mr. W. George Vialls, and in the same competition a second prize of £10 (presented to Mr. W. Tite), to Mr. Henry L. Florence, and a medal of merit to Mr. Herbert A. Marshall; the late Sir Francis W. Scott's prize of £10 10s. for the best design for the establishment of baths and wash-houses, in the style of the thirteenth or fourteenth century, was awarded to Mr. Ernest Lee; the Institute silver medal, with five guineas, for the best set of drawings illustrating the restoration of the choir of old St. Paul's, to Mr. Edmund B. Ferrey, and in the same competition a medal of merit was awarded to Mr. H. Renault Mangin; the Institute silver medal, with five guineas, for the best set of measured drawings of any buildings erected before the year 1700, and hitherto unpublished, to Mr. W. Henman, for his drawings of the church of St. Thomas, Winchilsea, and in the same competition a medal of merit to Mr. Charles H. Heathcote, for his drawings of St. Mary's Church, Portbury; the drawings of Mr. Morton M. Glover, illustrating Caistor Castle, Norfolk, were also honourably mentioned; and the Institute silver medal, offered for the best essay on the "Origin and Progress

of Window Tracing," was awarded to Mr. W. Scott Champion.

Mr. Roger Smith then read a paper on "Buildings for European Occupation in India and other Tropical Climates." A report of this paper appears on another page.

CONTAMINATION OF WATER.

THE paramount importance of a plentiful supply of pure water for domestic use is now attracting great attention, and with happy results. It must, however, be borne in mind that health is injuriously affected by a cause which the most liberal supply of the purest water will not remove—the pollution of the water itself in our cisterns, through defective mechanical arrangements. Dr. Frankland Smith says:—"In many towns, and notably in London, the water in our cisterns, and the air in our houses, are polluted by the gases which we allow to enter through waste-pipes descending into drains and sewers." There exists no doubt that these so-called waste-pipes act simply as poison channels, through which most noxious gases hourly ascend, and convert the pure water in the cistern into a dangerous infectant. A very simple contrivance, just introduced by Mr. Bishop, of Camden Town, called the "Camden Sanitary Valve," strikes at the root of the evil, by rendering a waste-pipe entirely unnecessary. A float and valve perform the work of the waste-pipe in a novel and efficient manner. The arrangement also combines cheapness of cost with perfect efficiency, the expense of its application being 50 per cent. below that of the usual imperfect cistern fittings, whilst it can be fitted to any cistern as at present in use for about ten shillings. We believe it has only to be better known to secure its general adoption.

CO-OPERATION IN THE BUILDING TRADES.

ON Wednesday evening a public meeting of operatives in the various branches of the building trades, and others, was held at the Drill-hall, Chelsea, in furtherance of the company now being established for building purposes on the co-operative principle. Sir Henry Hoare, who occupied the chair, said this was one of five meetings to be held during the present week in support of the Co-operative Building Company, which he was happy to say was already making considerable progress. He was informed there were about 2,000 shareholders, and that the list was daily increasing. Mr. A. A. Walton, the originator of the movement, then addressed the meeting at some length on the benefits that would accrue to the working men in the building trades by adopting the principle of co-operation, and, as far as possible, becoming their own employers. In addition to the many benefits, both moral and material, that would flow from the adoption of co operative self-employment and production, it would be the most efficient means of preventing those strikes and lock-outs that were so ruinous both to employers and workmen. Several other gentlemen having addressed the meeting in support of its object, a number of shares in the company were taken up, and a vote of thanks to the chairman concluded the proceedings.

SCHOOL OF ART.

THREE thousand pounds, the proceeds of the exhibition held in Wakefield in 1865, have been devoted to the establishment of an Industrial and Fine Art Institution in that town. To inaugurate the institution an exhibition of various articles was opened on Tuesday, and a public meeting took place in the evening under the presidency of the mayor. Mr. W. H. Leatham, M.P, Mr. Mundella, Mr. Redgrave, and others were present. Mr. Mundella described the results that had followed the teaching of science and art in Nottingham, where there are some fifteen hundred children learning elementary drawing in schools. He stated, also, that he had seen the progress made by continental workmen, and his belief was that it had not been made by their energy, for in this they were surpassed by British workmen; it was not because of their inventiveness, for in this British workmen could not be reached; nor was it because British workmen were inferior to them, for if they had the same training as other people, they would ever be first in ability; but it was because the Governments of Prussia, Saxony, and North Germany had taken care to give the populations under their control a first-class education. He asked that the same advantages should be given to Britain, and expressed an entire agreement with the remark of Mr. Cole, that to teach science and art properly a beginning must be made with children when at school.

BUILDING AND LAND SOCIETIES.

A NEW land company has just been started under the title of the United Land Company (limited). It has been formed as an adjunct to the well-known Conservative Land Society, for the purpose of extending, with a fixed capital, the operations heretofore carried on under the Friendly Societies' Acts. The operations of the new undertaking will comprise the purchase and sale of freehold and leasehold property of every description, the creation and sale of ground rents, and the company will carry on the business of a general land and building association generally. The capital is to be £250,000 in 50,000 shares of £5 each, with power to increase, the first issue being limited to £100,000. The deposit will be £1 per share on application and £1 on allotment. The new company has generally the same directorship as the Conservative Land Society, the offices of both also being the same—33, Norfolk-street, Strand.

WATER SUPPLY AND SANITARY MATTERS.

THE total indifference alike of the town authorities and smoke producers to the smoke consumption clauses of the Sanitary Act, 1866, has induced some of the inhabitants of Hanley to take the subject of remedy in hand; and a memorial to the Home Secretary, praying for an inspector to be sent down to enforce the Act, has been signed by about 200 ratepayers. The Duke of Sutherland has kindly volunteered to present the memorial and to support its prayer, and other powerful influence in its behalf has been secured. The nuisance arising from the smoke has become really intolerable, and is most prejudicial to health. The other towns of the Potteries are in a similar position to Hanley; and if an inspector is sent down, as no doubt there will be, the whole of the Potteries will possibly be put simultaneously under the operation of the Act, the central Government doing what the local government dare not or cannot do.

By a mutual contract between the tenants of the cottages at the village of Copley, near Halifax, and the proprietor of the dwellings, the late Colonel Akroyd, M.P., a sanitary committee or association has been formed, to carry out the sanitary objects of a local board of health. Copley is a neat village of about 150 houses, uniformly built, in the Gothic style of architecture, and pleasantly situated in the valley of the Calder. The population being only about 900, principally employed at Mr. Akroyd's works, advantage could not be taken of the Local Government Act, which requires a population of at least 3,000. However, by a mutual agreement between the landlord and the tenants, a sanitary board has just been formed. It is composed of nine members, three of whom are nominated by Colonel Akroyd, as landlord, and six are elected by the tenants.

Building Intelligence.

CHURCHES AND CHAPELS.

On Wednesday, the Bishop of London laid the foundation stone of a new church in Grove-street, Commercial-road East, dedicated to St. John the Evangelist. The proposed style is Decorated, and the cost will be £3,500, the building to seat 600. Messrs. F. and H. Francis are the architects.

On Tuesday the Bishop of the diocese consecrated the new church of St. Mary's, Upton, near Birkenhead. The style is Early English, and it will seat 300 persons. It is built of Stourton and other local stone. Attached are two schoolhouses capable of accommodating 220 children, with residences for master and mistress, built of brick with stone facings. The cost of church and schools is about £5,300. Mr. J. Cunningham, of Liverpool, is the architect, and Mr. John Wright, of Birkenhead, the contractor.

The chapel at Hampton Court Palace was recently reopened for Divine service, after having been closed for nearly five months for alteration and repairs. The high unsightly pews occupied by the soldiers quartered at the Palace have been removed, and the chapel has been fitted with open oak seats capable of accommodating at least a hundred more persons.

The Marquis Townsend has rebuilt the nave of East Raynham Church, Norfolk, at a cost of £4,000. The rector, the Rev. R. Phayre, has rebuilt the chancel at a cost of an additional £1,000. The reopening of the church has just been suitably celebrated. The style is Perpendicular, and the church consists of nave with north and south aisles, chancel, tower, and north and south porches. The walls are faced with squared flints and Ancaster stone dressings. The works have been carried out from the designs of Messrs. Clarke and Holland, architects, of Newmarket, by Mr. W. Hubbard, of East Dereham.

On Friday last the foundation stone of the first Scandinavian Missionary Church in England was laid at North Shields [see BUILDING NEWS No. 667.] The church has been designed by Mr. F. R. N. Haswell, architect, of North Shields, under whose superintendence it will be erected.

On Tuesday last the jubilee meeting of the Incorporated Church Building Society was held at Willis's Rooms, under the presidency of the Archbishop of Canterbury. During the fifty years of its existence this society has made grants to 5,303 places of worship in England and Wales, either for the purposes of erection, rebuilding, or restoration.

On the 18th ult. the foundation stone was laid of Emmanuel Church, Preston. The style is Geometrical Gothic, and the building will seat nearly 1,000 persons. It will be built of brick interspersed with strings and bands of coloured and moulded bricks with stone weatherings and dressings. The dimensions are—extreme length, 125ft.; extreme breadth, 86ft.; breadth of nave, 40ft.; chancel, 20ft.; length of nave, including the vestibule, 86ft. 6in.; length of chancel, 27ft.; height from ground to top of finial, 96ft. The architects are Messrs. Myres, Veevers, and Myres, of Preston. The amount of the contract, which has been taken by Mr. Bamber, is £5,200.

It is definitely settled that a new church is to be at once erected at Foxlydiate, Warwickshire, at the cost of the Baroness Windsor. Mr. Preedy, of London, is the architect appointed.

On Monday the Bishop of Hexham laid the foundation stone of a new (R. C.) Presbytery and chapel at Haverton Hill, Port Clarence. The chapel, which is to cost £700, is only temporary, and is dedicated to St. Michael.

BUILDINGS.

The first stone of the new Keble College was laid on Saturday, at Oxford, by the Archbishop of Canterbury. Mr. Butterfield has proposed plans for the whole building. The front facing the museum mainly consists of gateway, chapel, library, and hall, while the three other sides of the quadrangle, which is to be 220ft. square, consist of sets of rooms for one hundred students and six tutors. The whole is to be of red and grey brick and Bath stone, in the Decorated Gothic style. As, however, the £35,000 promised will only suffice for the erection of the three sides of the square devoted to the students' and tutors' rooms, the trustees have resolved to proceed with that, the most necessary portion of the building, at once, and to postpone for the present the erection of gateway, chapel, hall, and library. They hope, however, to obtain the necessary funds while the present works are going on, and to be able to finish the building out of hand. There is room on the site for a second quadrangle, should the requirements of the college demand it, besides allowing for a fair-sized garden.

A block of new almshouses at Victoria Park, Harrogate, have lately been finished. There are twelve houses in all. The style is Gothic, and in the centre of the main block a clock tower rises to the height of 60ft. The total cost of the buildings is about £3,000. Messrs. Andrews, Son, and Pepper, of Bradford, were the architects.

The foundation stone of new buildings in connection with the College of Bishop Fox, at Taunton, was laid last week. The architects are Messrs. Giles and Robinson, of Furnivals Inn, the builder being Mr. Spiller, of Taunton. The style of architecture will be thirteenth century Gothic. About £11,000 will be spent in the first instance on the building, and the ground costs £3,000.

On Saturday last the foundation stone of the new Turner Free School, at Coatham, was laid. The schools will be built in the Gothic style, and will be 103ft. 6in. long, 52ft. wide, and four storeys high. At the gable end there will be a lofty tower. The entire cost of the building will be under £4,000.

The foundation stone of the new National Schools at Wilmscote was laid on Friday by the Bishop of Chester. The site is near the old church, lately restored in the Perpendicular style, and with it the schools have been designed to harmonise. They will be built of grey bricks relieved by slight touches of red in arches, bands, and stringcourses. There will be accommodation for 120 boys, 100 girls, and 130 infants. The architects are Messrs. J. Medland Taylor and Henry Taylor, of Manchester. The cost of the schools is estimated at £2,500.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p m. on Thursday.

Notice.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

Received.—E. W.—B. J. T.—W. R. H.—W. S.—F. R. N. H.—S. C.—O. W. D.—J. G. H.—I. E. L., jun.—I. N.—W. R. T.—E. W. G.—I. H.—C. L. E.—E. P.

Student.—Season tickets to the Architectural Exhibition are issued.

G. C. S.—It is purely a legal question.

F. Pither.—You have to undergo no examination to become a member of the Society of Arts. You require two members, one to propose and the other to second you, and you may calculate on being duly elected. The annual subscription is two guineas.

Correspondence.

ARCHITECTS' CHARGES IN PARIS.

To the Editor of the Building News.

Sir,—Looking through some papers to-day, I came across the enclosed circular. Oftentimes I have noticed in your valuable journal remarks about architects' doings—working for paltry sums in competitions against the profession. What think you of the enclosed, where an architect circulates such notes from house to house to thank his friends for past favours, gives notice of removal, and quotes his commission?

This circular was left by a lad, who had a handful, at my brother-in-law's house. He had never built, neither did he know the man, and certainly should never employ him. Having conducted works in France for a long time, and knowing something of French architects, I confess I was somewhat surprised, although well aware that there are surprising things abroad as well as at home.—I am, &c.,

Alfred A. Anderton.

31, West Hill-road, Brighton, April 22.

[COPY.]

Paris, le 10 Avril, 1864.

CHANGEMENT DE DOMICILE.

Monsieur,—J'ai l'honneur de vous informer que mes Bureaux situés rue Notre Dame-de-Lorette, 52, seront transférés, à partir du 15 courant,

Place du Havre, 15 (quartier de la Madeleine).

Je saisis avec empressement cette occasion, Monsieur, pour vous assurer que je continuerai, comme par le passé à faire tous mes efforts pour mériter la confiance dont vous m' avez toujours honoré.

En attendant vos ordres, je vous prie d'agréer, Monsieur, l'expression du respectueux dévouement de votre très-humble et très obéissant serviteur,

Edouard Colle, Architecte,
15, Place du Havre, Paris.

HONORAIRES:

1	Jusqu'a 100,000fr.	5 0/0
2	De 100,000fr. à 300,000fr.	4 0/0
3	De 300,000fr. à 500,000fr	3 0/0
4	De 500,000fr. à 1,000,000fr.	2½ 0/0
5	Au-dessus de 1,000,000 de fr.	2 0/0

ORGANS.

Sir,—I have just read with considerable amusement the remarkably edifying letter of your correspondent "R. T.," who, with the characteristic modesty of all really great men, writes anonymously, and even forbears to acknowledge that the opinions he expresses are exclusively his own, but rather seeks to make it appear that he is simply stating well-known facts. "R. T." is evidently a man of research, and doubtless a great authority in organ building matters, but his exceedingly temperate and *unprejudiced* attack on Mr. Henry Willis is open to one slight objection. His charges are utterly untrue in every particular. He is possibly unaware that he also calls in question the intelligence and practical knowledge of our leading organists and all those eminent musicians who know anything on the subject of organs; but I beg leave to inform him that *they* tacitly acknowledge Mr. Willis's great ability, and consider that he has done more for the art of organ building (in this country at all events) than any other man of our time.

Without, however, for one moment questioning the merits of some other English builders, whose existence seems to be utterly ignored by your correspondent, I may state that the pneumatic lever in its perfected form owes its existence to Willis, and surely it must be admitted that his numerous patented inventions and improvements (all being of acknowledged merit) are alone sufficient to entitle *him* to a place amongst *the* organ-builders of Europe. With respect to "*tone*," any competent judge acquainted with his organs will, I feel certain, unhesitatingly affirm that the "wishy-washy" (whatever may be the exact significance of that elegant adjective) diapasons, "devoid of the proper harmonies," the "small, miserable, and screamy" mixtures that will not mix with the rest of the work, as well as the "unpleasant, tight-toned, unequal" reeds on high pressure, exist only in "R. T.'s" singularly imaginative brain, although one really cannot help regretting that such fluent eloquence should so lack the prosaic element of truth.

But this being essentially a question of fact and not of argument, will be instance any organs by Willis (as he is so thoroughly acquainted with them) that are characterised by all the pleasant little faults he mentions, including the "pump-handle" (!) that requires such vigorous treatment? and at the same time he might also furnish your readers with a select list of the "shocking rubbish" to be found in so many English churches, with the builders' names attached, for this would be really interesting.

Now for the vexed question of metal. Neither Schulze nor Cavaillé consider that "spotted" metal affects the tone of a pipe in the slightest degree; the sole advantage it possesses is greater durability. "R. T." has doubtless remarked the "fine singing tone" produced by the former builder, who, nevertheless, invariably uses *zinc* for large pipes. He has also, of course, seen and admired the exquisite workmanship (!) of Herr Schulze, presenting as it does such a strong contrast to the "rough and ready" style of Henry Willis.

I remember some years since seeing a chamber organ built for Lord Brougham by Robson, an instrument containing an open 8ft. diapason constructed of *pure silver*, but the tone was not affected in the smallest degree by this circumstance, and I really think that even the highly sensitive ears of your correspondent would have failed to detect the slightest improvement in the quality of tone thereby produced. The employment of "spotted" metal is simply a question of cost. On the continent it is used much more extensively than in England, because builders there obtain, as a rule, more than double the price paid for similar work here in England. In this country *quantity* is too often considered of more importance than *quality*, and it cannot be denied that we do possess many execrable specimens of so-called *cheap organ building*; but once alter this system of false economy, pay English builders continental prices, and it will be found that we can produce instruments far surpassing anything to be found out of England.

In advocating French reeds—which are certainly very fine—it is frequently forgotten that everything is done to enhance their effect in a French organ. The flue work is entirely of a Gamba and fluty quality, calculated to support and enrich the reeds; not, as in English and German organs, allowed to have a distinct and independent character of its own. The consequence is, that French instruments are never characterised by any breadth or grandeur of tone in their general effect, but partake very much of the nature of an harmonium on a large scale. Place French reeds in an English organ, fairly test them against some of Willis's "tight-toned, unequal" specimens—especially in combination with the rest of the work—and I feel satisfied that the result would be in his favour.

In conclusion, allow me to add that if so many eminent musicians state their opinion that Mr. Lewis is *the* organ-builder of England, it seems somewhat strange that, with the additional advantage of obtaining their instrument at "prime cost," the Committee of the Albert Hall of Science and Art did not avail themselves of his services, as they were guided in their decision by very eminent musicians, and Mr. Willis was unanimously selected to execute the important work.

Apologising for so intruding on your space, and assuring you that I have not the slightest personal interest in this question, I am, &c.,

Frederick Archer.

81, Regent-street, April 23.

THE EARTH SYSTEM.

Sir,—In your publication of the 24th inst., your correspondent "B." has stated two facts with regard to the above system which are most erroneous. He speaks of the manure as, "after all, a very doubtful article, one I am sure no experienced or scientific farmer or gardener would think worth the labour of fetching from the common depôt. Now, I am able to contradict this, as I know several instances in which the earth, after passing through the closets, is sold for 60 shillings per ton. Again, he says, "and yet we are asked to sanction a system equivalent to this, that of placing dried earth in the hopper and removing the receptacle that receives it; and this daily, for it must not be told us that the contents might remain longer without becoming offensive." If your correspondent will go to the offices of the Earth Closet Company he may there see in the cellar quite a cartload of the earth, after having passed through the closets, and from which not the slightest smell arises; moreover, the contents of the receptacle of a commode may be kept in a bedroom for months and not the faintest smell is perceptible. In the West Riding Prison at Wakefield there are closets in nearly 200 cells, the receptacle is only emptied once a week, and no smell whatever arises.—I am, &c., H. J. Girdlestone.

31, Duke-street, Westminster, April 29.

THE EARTH-CLOSET.

Sir,—"R.," in your issue of the 24th inst. admits the extreme evils of the present system of disposing of the sewage from houses when he says, "We carry away by very imperfect contrivances the refuse of dwellings into the rivers and streams, thus polluting the waters, and wasting a product that would be highly useful manure." The argument that follows is simply a *laisse faire*—I suppose on the principle that it "is better to bear the ills we have than fly to those we know not of," forgetting its inapplicability, as he has admitted after proof that these ills had no existence in fact. He says, "An earth-closet in itself may be made as little liable to derangement as a water-closet; but what would happen in the majority of households if the water to supply them had to be placed in a receptacle, and the contents had to be emptied every day? It would be impossible to avoid very much annoyance and discomfort, to say nothing of greater evils." This no doubt would be true of water, but he adds, "and yet we are asked to sanction a system equivalent to this—that of placing dry earth in the hopper, and removing the receptacle that receives it, and this daily, for it must not be told to us that the contents might remain longer without becoming offensive. If allowed to remain until decomposition sets in, which would be within twenty hours—and very often decomposition of solid matter has taken place before it leaves the human body—then no kind or amount of earth would prevent the escape of effluvia." I have seldom met with so many inaccuracies expressed in so few lines. The public are not asked to remove the contents of the receptacle daily, nor weekly, nor monthly, nor even quarterly; the removal will depend upon the number of persons using a closet, and upon the cubic contents of the vessel or vault which is the receptacle. And I must tell him that hundreds can prove that the earth may remain without offence for an indefinite time. In Wakefield prison there are

two hundred of the cells fitted with earth-closets, and the earth is removed weekly, but it has remained on occasions for a month.

No matter how long it may be allowed to remain, decomposition does not set in, as it is prevented by the application of earth, which is chemical in its action. Even in case of disease, where decomposition has begun, earth takes up all the gases, arrests further decomposition, destroys the effluvia and poisons that previously emanated. Notwithstanding the argument which "B." has indulged in, to the inconsistency of which we learn he was blinded by the products of a "dust cart," he had written: "I had tried a closet devised by a gentleman of Reading for several months, using peat charcoal as the best deodoriser known to us, and nothing could be more successful;" and yet he recommends instead that which he characterises as part of the very "imperfect contrivances," and in justification admits that the earth-closet does save for use the excrementitious matter; but adds: "I am sure no experienced or scientific farmer or gardener would think it worth the labour of fetching from the common depôt." This statement is best answered by the following testimonials:—

"Mr. J. Gadsden, who holds upwards of 600 acres, who has applied earth once passed through the closet to a turnip crop, and has produced some of the finest roots I ever saw, estimates its minimum value at £3 per ton."

"Mr. Gamble has arrived at the same conclusion."

"Mr. Hy. Taylor, manure dealer, Dorset, estimates it at from £2 to £3 per ton."

"Rev. H. Bnuen, Belvedere, obtained crops from employing it when stable manure had failed. His peas grew to 7ft., and were covered with pods, while the white heads of his cabbages weighed four pounds."

It remains only to point out how limited is the chemical knowledge of your correspondent. He offers in proof that earth does not possess deodorising or chemical properties, for he says, "if a shovelfull of the mixed excreta and earth be placed in the fire foul gases will be given off." That is, if any chemical compound is placed on a shovel, over a fire, and it gives off fumes, its ingredients were not chemically combined. Perhaps your correspondent would give us the history of this discovery.—I am, &c.,

E.

THE NATIONAL COTTAGE HOSPITAL FOR CONSUMPTION.

SIR,—My attention has been called to a letter in a recent number of the BUILDING NEWS, signed "W. Bosworth," and which calls for a few brief remarks. The internal or ground plans of the cottages have been in the main definitely agreed upon. For these we are indebted to Mr. Hellyer, the honorary architect. The advertisement in your paper was for designs of the external elevations, &c., of the cottages, these to be, in their main features, in accordance with the ground plans furnished. The remuneration for the plan selected (should choice of any be made), I am sure I shall be supported in stating, will not be confined to the premiums mentioned, but such terms will be offered as appear to the general committee to be right and fair, and in the action of that committee I am satisfied competitors may place the fullest confidence. Owing to the delay which has taken place in furnishing the lithographed plans the time will now be extended to the 21st of May.—I am, &c.,

ARTHUR HILL HASSALL, M.D.

Ventnor, April 28.

MANCHESTER TOWNHALL COMPETITION.

SIR,—With reference to Mr. Charlesworth's letter in your last week's impression, you will perhaps allow me just to say that I am glad he has quoted at full length the passage in the instructions, from which in my former note I gave an extract merely. I had no wish to ignore the lines Mr. Charlesworth has italicized, and your readers can now judge for themselves whether the instructions do, or do not, allow some degree of latitude with regard to the projections in the Princess-street and Lloyd-street fronts. At all events, I was by no means alone, among the eight competitors, in interpreting the instructions as I did.—I am, &c.,

ALFRED WATERHOUSE.

8, New Cavendish-street, Portland-place, W., April 29.

SIR,—I had much pleasure in perusing your admirable critique on the second set of designs for the above, and the public are much indebted to you for laying before them an unbiased statement of the faults and merits of the same; but I think it would have been far preferable, and the public would have been much better satisfied, if your suggestion had been carried out, and the first selected designs exhibited with the last, instead of being kept hidden; more especially those of Mr. A. Waterhouse. In commenting upon the designs finally selected, you said "it is only when we come to the plan that we find anything commendable, and here Mr. Waterhouse has been very successful." Now, in order that the public may have some idea of the way in which justice was done to the competitors by the professional gentleman who made the first selection, I can, if required, give you the name and address of one of the first competitors who would have no objection to show his rejected plans, *the main features of which are the same as those of the ones finally selected.* This will also show what reliance may be placed in the pompous article of your contemporary, called by one of your correspondents, "*Couleur de rose*," and prove once more the truth of the proverb, "*Tout ce qui brille n'est pas or.*"—I am, &c.,

April 28, 1868. A NON-COMPETITOR.

Intercommunication.

QUESTIONS.

[839.]—CONSTANT FOR MEASURING STRENGTH OF GIRDERS.—I should feel obliged if any correspondent would state the value of the constant to be used in calculating the strength of solid rolled girders with equal flanges.—J.

[840.]—STONE PIPES AND FROST.—Would any one of your correspondents, who has had practical experience in executing stonework, kindly give me his opinion as to whether a stone down-pipe, 10in. in diameter, the bore 4in., would be liable to fracture by frost or the action of water in any way; and farther, if lead lining would secure against this danger, or be otherwise desirable?—X. Y. Z.

[841.]—ORGAN BUILDING.—Would some correspondent be kind enough to oblige an amateur by answering the following questions?—1st. What proportion should the height and width of the mouth have—to the diameter of a pipe—for open diapason, principal, and fifteenth; and height of mouth for wooden st. diapason; and is the same proportion observed in both large and small pipes? 2nd. What thickness should the languette be, and should the upper lip be immediately over the opening between under lip and languette; and what angles should the upper and under lips be bent to? A sketch would much assist.—AMATEUR.

[842.]—DRAIN TRAPS.—Can any of your readers inform me whether there is manufactured and sold a better form of trap for kitchen sinks than the ordinary brass bell trap? The bell trap, as now in use, is defective; because, by the carelessness of servants, the grating (and with it the bell, and of course the trap) is frequently left off, so as to allow the passage down the waste pipe of the dirt which accumulates in sinks, and when this is the case the sink acts as a ventilator from the sewer into the house. I recollect having business in the kitchen of the house of a gentleman who stands prominently forward in the literary world upon sanitary subjects, and who I found paid so little attention to his own house that he thus had a constant supply of sewer gas in it. Some people, to avoid this inconvenience, have no trap in the sink, but allow the waste pipe to communicate with the drain immediately above a syphon pipe. This is objectionable, as the refuse from the sink frequently stops up the syphon pipe; and the same objection applies to a brick cesspool and dip trap in the drain. Others, again, in the case of a kitchen built as an outbuilding in a yard, allow the waste pipe from the sink to project from the wall over an iron D trap or bell trap in the yard. But this system is not always practicable; and when it is, is the cause frequently of a damp, greasy, slimy wall, and unclean paving. What is wanted is some adaptation of the D trap for sinks. In a D trap the grating may be removed without destroying the trap, and at the same time without allowing the entrance of rubbish to the drain. Whilst upon this subject, allow me to state that local boards and sanitary inspectors should, for the most important reasons, entirely discard the old bell trap for surface and yard drainage. From my experience, I find that half the bell traps in London are minus the gratings, which are slightly made of cast iron, and soon get broken; the consequence is, that the new system of house drainage is the cause of an extensive amount of disease, by bringing under the very nose of the occupier of the house a beautiful contrivance for the direct ventilation of a vast network of sewers. The D trap, or others equal in efficiency, ought to be the only trap allowed. Its advantages are—1. That the grating may be removed or broken without destroying the trap. 2. It prevents the entrance of dirt into the drain. 3. It is more easy to cleanse, and its stoppage by dirt in the trap more easily understood. 4. It has an advantage over the bell trap, because its form prevents children taking the top off and dropping sticks and stones into the drain, an extremely frequent cause of stoppage in poor localities.—A. KIRKBY.

[843.]—DENNETT'S FIREPROOF CONSTRUCTION.—Can any of your readers tell me what is the principle of Dennett's fireproof construction for floors, ceilings, and roofs?—INQUIRER.

[844.]—BURNING CLAY.—What is the best method of burning clay into brick ballast to form road bottoms?—FREEHOLDER.

[845.]—ROYAL ACADEMY.—How can I become a student of the Royal Academy; what is the expense; and what are the advantages attached to the studentship?—PUPIL.

REPLIES.

[816.]—MIXED CEMENT.—Let me advise your correspondent not to mix his half and half in the way he proposes, or he will repent it. Roman cement cannot be relied upon for outdoor work. Portland is the only cement trustworthy where water is concerned. A case came under my notice a couple of years ago, where the employment of Roman cement in some foundations cost those using it £250 for pulling down the wall and rebuilding it in Portland. It was no better than dirt; had neither set nor bond, and common mortar would have made a better job.—EXPERIENCE.

[813.]—BULGING WALL.—I am afraid "Nep" has not built his wall upon a proper plan, and that it has no buttresses, as he mentions that it is 1ft. 6in. thick. If so, a wall 20ft. long and 12ft. high could not do otherwise than bulge. I take it his wall is built as represented in the plan (fig. 1), whereas, it should have been constructed as in fig. 2.

FIG. 2

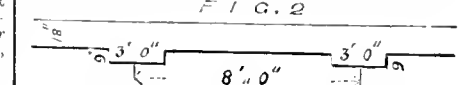


FIG. 1

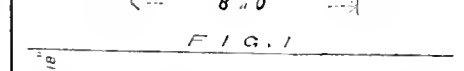
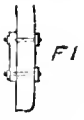


However, the thing to be done now is to prevent it falling down, as it seems likely to do. This can be prevented by the following plan, which is often adopted in similar cases:—Get a balk of timber, or, better still, an iron casting, and place it against the part bulging out as in fig 3



taking care to screw it well up by bolts passing through the casting and the wall, good substantial washers being used at the other side of the wall.—J. S.

[816.]—STAMPED SPECIFICATIONS.—There is no doubt but that it would be a safer plan to stamp a specification; but if a man put his signature to a deed, and afterwards refused or failed to carry it out, pleading that there was no stamp to it, he would certainly lose his case in equity, although he might not in law. But now there is a better spirit pervading our law courts. It was only the other day that an eminent judge decided dead against a man who strove to escape from his obligation by a legal quibble; and remarked that the time was gone by for allowing justice to be thwarted by such puerile pleas.—CLERK.

[817.]—MORTAR FROM OLD MATERIAL.—Allow me to inform "Builder" that I have frequently used old bricks and rubbish in the manner he mentions for the purpose of making concrete, but never for mortar. At the same time, I have known them to be so used when it was impossible, except at an enormous price, to procure any suitable sand. A great deal in this instance depends upon the quality of the lime, and the old materials should not be ground too fine, or the mortar will be weak in binding properties. With proper care I should not hesitate to use them if I could not get sand.—CONTRACTOR.

[821.]—GILDING.—Oil gilding is used for outside work, and the adhesive material used is called oil size. It must always be kept free from dust, and well stirred before it is used, and laid on as thinly as possible. The gold leaf is then applied after some time, when the size has so far sunk into the surface to be gilded as to be what is called "tacky" on the face. Water gilding is used for such purposes as picture frames, and the material used for sticking the leaf is water size; this must be applied in a succession of coats until a perfectly flat face is obtained, and then when it has set the face of the size is wetted, and whilst wet the gold leaf is applied. Both processes require great skill, and success cannot be attained in them without much practice.—HOPE.

[822.]—COMPO ORNAMENTS.—The materials used in compo ornaments are glue, resin, and raw linseed oil. Boil the glue in water in the proportion of a pound to half a pint; melt the resin in the oil in the proportion of a pound to a pint of oil; then boil all together, and when well boiled mix a quantity of whiting to about the consistency of dough, and it is then ready to put into the mould, or otherwise.—F. R.

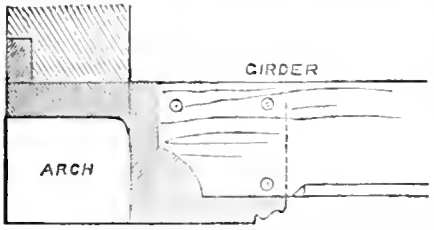
[823.]—CHANGE RINGING.—If "Changeling" will apply to the Society of Ringers at Leeds they will send him a book, at the cost of about 3s., which will give him the information he requires for change ringing from two to eight bells.—F. R.

[825.]—PAINTING ON WINDOW-GLASS.—If the decoration is intended to be for inside work, a not very lasting, but pleasing, effect may be obtained by using only the most transparent colours, such as gamboge, lake, Prussian blue, in cake colours, carefully rubbed on a palette, and when dry varnished with copal varnish.—EXETER.

[826.]—RUST ON STEEL ORNAMENTS.—There is no way of entirely cleaning off rust spots when they are formed, but they can be prevented entirely by coating the steel with a colourless lacquer.—CHAIN MAIL.

[829.]—SUPPORTING A BEAM.—The manner "G. M." described for inserting a wooden girder into an arch in your last issue is not practicable, because, in the first place, he removes the "key," and then substitutes wood, which would

shrink, and the whole building collapse. I would suggest using a strong cast-iron saddle, and set over the keystone, in the centre of which I would form a central web, and the wood girder be bolted to it, as per sketch. By adopting



this plan, the girder and saddle might be removed without difficulty, and the wall made good, as though it had never existed.—F. H. L.

[832.]—PAPER-HANGINGS.—In reply to "J. Gold," I beg to say that the powder used to produce the raised flowers on paperhangings is composed of very finely ground cloth. It is applied thus:—The pattern block having been dabbed down, a prepared size covered with size is pressed on the paper, and the impression is of course left in size. The sheet thus prepared is then taken to a "hammock" on treadles covered with the powder, a lath being employed to strike up the under surface of the hammock, and so fix the powder on the sized sheet.—C. W. T.

[833.]—BUILDING CHIMNEYS.—In answer to "Edwin Hale," I may say that building chimneys of great height the shaft should diminish from base to top, round or square, with flue circle of one diameter. By this you gain the reverse bond in your brickwork. At the same time, you should be particular in your bed and quarter joints. Four courses to one foot will make the work solid for great heights.—JAMES SAXBY, Guilford Lawn, Ramsgate.

WAGES MOVEMENT.

The strike of the bricksetters at Stockport for an advance from 5s. 6d to 6s per day, is seriously affecting several large undertakings now in course of erection in the neighbourhood.

The Bricklayers' Union at Liverpool have caused a strike at the works of Messrs. Holme and Nicol, large builders and contractors there, the grounds of dispute being understood to be the refusal of Messrs Holme and Nicol's foreman to pay a penalty of £5 towards the expenses of a former strike, and an opposition to a new code of rules of which the master builders had given notice. The Master Builders' Association have intimated that, unless the strike against Messrs. Holme and Nicol be immediately withdrawn, steps will be taken to protect that firm, and that, after May 4 next, the master bricklayers will only employ men who are willing to work under the new code of rules.

STAINED GLASS.

A memorial window has just been placed in the Guild hall, York. The subject commemorated is the marriage of King Edward III. and Philippa, of Hainault, in York Minster, on January 24, 1328, and occupies the principal portion of the four chief lights of the window. Among the figures represented are the young King and his bride, the Archbishop (William de Melton), who is giving the nuptial benediction, Nicholas de Langton, who, in 1328, was for the seventh time Mayor of York, the Earl of Lancaster and Lord Mortimer.

STATUES, MEMORIALS, ETC.

The Polish patriots have determined upon erecting a monument commemorative of the struggles of Poland to regain her national independence. The site chosen is in one of the most beautiful districts of Switzerland, on the heights of Rapperswyl, bordering the Lake of Zurich. This memorial will consist of a column of black marble, 25ft. high, standing upon three platforms of granite, each of the latter serving as a step up to the pedestal. On the summit will be an eagle with out-spread wings. Historical inscriptions and the arms of Poland are to be carved upon four tablets on the lower part of the shaft; and the whole will be surrounded by an iron railing. The work will be completed in the course of the summer. A circular from Count Ladislas Plater, dated Villa Bloelberg, near Zurich, April 22, has been issued, in which an appeal is made to all who have the cause of Poland at heart to assist in carrying out this patriotic demonstration.

LEGAL INTELLIGENCE.

COPYRIGHT IN PHOTOGRAPHS.—Graves *v.* Beale.—Mr. Francis moved for a rule calling upon Alderman Sir R. Carden and other justices to show cause why they should not state a case for the opinion of the Court of Queen's Bench in a matter in which they had adjudicated, relating to copyright in certain photographic pictures. Beale was a photographic artist and picture dealer in St. Paul's-churchyard, and Mr. Graves was the owner of three pictures, namely, "The Sermon," "The Second Sermon," and "Ordered on Foreign Service." The defendant took photographs of the engravings, and sold a number of them, and he was convicted in twenty-six cases, and fined by the justices 5s. in each case. The fines were paid under protest. The magistrates were called upon to state the grounds of their decision, but refused on the plea that there was sufficient evidence of the registration of the copyright, and that the infringement of the act constituted the offence. The Court held that the registration was sufficient, and that the photograph of a thing or picture was a picture itself; and, therefore, that the sale of the twenty-six photographs having been proved, it did not matter whether it was one transaction or twenty-six offences. Rule refused.

MEETINGS FOR THE ENSUING WEEK.

MON.—Society of Engineers.—"On the Marseilles Docks," by M. De Merritens.
TUES.—Institute of Civil Engineers.—Renewed discussion upon the papers on Irrigation in India and in Spain, &c.
FRI. — Architectural Association. — Special business meeting, after which a discussion on the best means of utilising superfluous heat from ordinary fires. Chair taken at 7.30.
SAT.—Associated Arts Institute.—Committee meeting.

Our Office Table.

Adulteration would seem to be the order of the day. In a recent lecture to the Social Science Association, Dr. Letheby, analyst to the corporation of the city of London, mentioned that water is put into milk, lard into butter, chicory into coffee, and black tea is faced with black lead, the green is also "got up" with minerals, powdered gypsum, and Prussian blue. The Doctor might have added that sugar is extensively sanded, and that there is hardly a beverage we drink that is not more or less adulterated, or, in other words, poisoned.

The annual dinner of the Institution of Civil Engineers is to be held at Willis's Rooms on Wednesday next, May 6, when the chair will be occupied by Mr. Charles Hutton Gregory, the president.

Early next week the portion of the Southern Thames Embankment, extending from Westminster to Lambeth Bridge, will be opened to the public. To-morrow the members of the Metropolitan Board will walk in procession along the footway, and inaugurate the opening.

The authorities of Trinity College, Dublin, are about to modernise the quadrangle in front of their buildings where the Prince of Wales uncovered the Burke statue. They intend to plant shrubs and to place a handsome *jet d'eau* in a suitable position.

Dr. Lunge gives, in *Dingler's Journal*, a method of making an excellent black varnish for ironwork. He distils gas tar until nearly all the volatile products are got rid of. He then stops the distillation, and dissolves the residual pitch either in the heavier oils, or, if a very quickly drying varnish is required, in the light oils or naphtha. This varnish is, of course, the original tar minus the ammonia water, carbolic acid, and other things which give it its disagreeable odour, and make it so long in drying.

It is only right to state that Mr. Cole has determined to decline the bonus of £1,500 in addition to his usual salary, which he is returned as having received in a paper recently laid upon the table of the House of Commons, in consideration of his services in Paris while superintending the British Section of the Exhibition. This matter was alluded to by us last week.

Donors and constructors of drinking fountains would do well to remember that not the least interested of the public in their philanthropical endeavours are the young, and so design their structures that they may not be inaccessible to thirsty juveniles under 4ft. 6in. At the fountain in Lincoln's Inn-fields we noticed this week a *gamin*, after several unsuccessful endeavours to obtain a footing on the iron guard protecting the part assigned to dogs, who in this respect are by far the better provided for, tumble backwards into the gutter, with the result of increased dampness to his breeches and dryness in his throat.

A sad accident occurred at Chicago on Good Friday. The Roman Catholic Cathedral of St. Mary was filled with worshippers, and the weight of the multitude caused a portion of the floor to give way, which, raising a great dust, led some one to cry "Fire!" A terrible panic ensued, and in the rush that was made for the doors four women were crushed to death, and twenty or more persons were seriously injured, three of them having since died.

A fund is being raised for the archæological exploration of Rome. Of the vast importance of such an exploration there cannot be two opinions. Mr. J. Parker, treasurer of the British Archæological Society of Rome, would be glad to receive subscriptions for the purpose.

At a meeting of Commissioners of Supply, held at Selkirk on Tuesday.—Mr. Rhind, architect, being present—the contracts for the erection of the new County Buildings were adopted, subject to the approval of Government. The total estimates are slightly over £7000.

The Society of Arts will consider the award of the Albert medal at their next meeting. The medal was instituted to reward "distinguished merit in promoting arts, manufactures, and commerce." In 1864 Sir Rowland Hill obtained the medal for his reforms in the postal system. In 1865 the Emperor of the French obtained the medal for his judicious "patronage of art, his enlightened commercial policy," and for the "abolition of passports in favour of British subjects." In 1866 Professor Faraday obtained the medal, and in 1867 W. F. Cooke and Professor Wheatstone in recognition of their joint labours in establishing the first electric telegraph.

Mr. Maclagan, M.P., and Mr. T. G. Murray have lately been in communication with the Enclosure Commissioners, in reference to their requirements for cottages erected in Scotland under their sanction. The commissioners say that while they still adhere to the principle of four-roomed cottages as the best means of separating the sexes, under the representations made that the cost operates as a restriction on improved cottage building, every facility shall be given to extend the practice, which already has in many cases been adopted, of sanctioning cottages composed of three rooms, to be charged on the estate. In such cases it is recommended that the living-room should not be of a less size than 16ft. by 18ft., and 10ft. in height, but in no case should the size be less than 12ft. by 15ft., nor the height less than 8ft.—they think 9ft. preferable. They are further of opinion that the method of structure which encourages the practice of having recesses in which box-beds are placed should be avoided. A scullery or wash-up place as well as the usual out offices should, of course, be also provided.

We view, with great surprise and disappointment, the obstacles thrown by the Government, on Wednesday last, in the way of Mr. Torrens' "Artisans' and Labourers' Dwellings Bill." It was universally understood that no opposition was likely to arise to the measure from any quarter, but at the last moment, Lord John Manners offered a number of purely technical objections, and the consideration of the Bill is postponed for a week for the avowed purpose of giving the Attorney General an opportunity of conferring with Mr. Torrens, and surmounting the legal impediments that are said to exist. We trust that the result may show that the Government have really intervened to help and not to hinder. This or some similar measure must soon become law if we are to encounter with any chance of success the mass of crime and sorrow, so great a part of which originates in the filthy condition of the homes of our people.

On Saturday afternoon last the church of St. Paul's, Little Chester, near Derby, was struck by lightning, and the south-east and largest pinnacle completely shattered. Stones were hurled in all directions, the slate demolished, and the lead ripped off from the roof. A portion of the stonework of the opposite tower was also carried away. The interior of the church was but slightly damaged. No lives were lost, although many persons live in the vicinity of the church.

A clock of very extraordinary and beautiful workmanship, designed by Raingo the Elder, and of the period of the First Empire, is now on view at M. de Boos', 20, Down-street, Piccadilly. In the base is a musical box, which plays every hour. The front dial has, in addition to the usual index of time, a record of the days of the week. The signs of the Zodiac and days of the month are also registered, and in connection with these is an extremely beautiful mechanical arrangement, exhibiting from day to day the relative positions of the moon, earth, and sun. The whole of this marvellous mechanism is worked by three springs; and the design, notwithstanding its seemingly complicated machinery, is very light, graceful, and chaste.

The slowness of the removal of St. Benet's old church, Gracechurch-street, turns out to be this:—The person who undertook to remove it had a certain time allowed by the contract, and so put up his hoarding. Instead, however, of carting the materials away himself, he preferred to sell them upon the ground, and opened a truck and store-yard. The licence expired on the 24th of last month, when the church should have vanished and the hoarding have been cleared away. Neither of these events have been completed, and, the inhabitants grumbling, the affair got into the Court of Common Council, a summons was issued, and another fortnight has been allowed.

Visitors to the Architectural Exhibition now opened at 9, Conduit street, are informed that the Museum of Building Materials, which adjoins the exhibition, is open daily free of charge. The museum will amply repay a visit.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

2676 J. FLETCHER. IMPROVEMENTS IN STEAM OR OTHER POWER HAMMERS. Dated September 23, 1867.

This invention relates, first, to the hammers driven by a crank or cam shaft actuated by steam or other power, and consists in an improved mode of starting, stopping, and regulating the speed of the hammer by a lever upon a shaft having two cams, one of which applies a break to the fly-wheel, and the other throws the driving power out of gear, or shuts off the steam. The invention consists, second, in making the top or upper part of the hammer block hollow for the reception of two spiral springs acting above and below a disc or piston, which is connected by a link to the crank shaft driven by steam or other power. As the crank shaft revolves, the disc or piston, acting on the springs, raises and lowers the trip or hammer block, the force of the blow depending upon the weight of the trip or hammer block and parts connected therewith, the speed of the crank shaft, and the strength of the springs. Instead of springs, atmospheric air, or other elastic medium, may be employed.—Patent abandoned.

2688 G. BATCHELDOR. IMPROVEMENTS IN TROUGH WATERCLOSETS. Dated September 24, 1867.

The object here is to provide trough waterclosets at a less price with rounded surfaces, or surfaces sloping towards the outlet valve, and in part, that is to say, as regards the trough part, of non-absorbent and more durable materials than those now in use. For this purpose the patentee makes or constructs the troughs of earthen or stoneware, and in or over the soil pipe leading therefrom he fixes or forms a valve seating, the valve of which is connected to a lever or its equivalent, and is led into a locked-up space, the key of which is in the possession of a person whose duty it is to see that from time to time the trough is emptied and flushed. The seats are of the ordinary form.—Patent completed.

2701 W. WOODCOCK. IMPROVEMENTS IN APPARATUS FOR WARMING AND VENTILATING BUILDINGS. Dated September 25, 1867.

This invention, under one head, has reference to improvements applicable to stoves of the character of Gurney's stoves, or any stove having a number of plates from its outer surface, with the plates vertical in a trough of water, or any stove of analogous construction or action, and consists in constructing the said stoves with feeding door, fire door, and ashpit door, so arranged that they shall open into a stoking chamber or compartment, which is otherwise entirely separated from the stove, such stoking chamber or compartment being wholly separated from the building to be warmed and ventilated. —Patent completed.

Trade News.

TENDERS.

ALSAGER.—For new Wesleyan Chapel, Alsager, Cheshire. Mr. Geo. B. Ford, architect, Burslem:—

Stringer	£2522
Booth	2440
Keon	2230

BERMONDSEY.—For erecting premises at Bermondsey for Mr. Wallace. Mr. J. Gale, architect:—

Epps and Gates	£630
Wells	584
Maiers	563
Nightingale	555
Wood	507
Sheppard	495

CATERHAM.—For a pair of semi detached houses to be erected on the Godstone-road, Caterham, Surrey. Mr. George Robson, architect:—

	With attics.	Without attics.
Ward	£985	£915
Elliff	894	845
Baldwin*	900	830

* Accepted subject to reductions.

CANNINGTON.—For erecting a new Congregational Chapel at Cannington, near Bridgwater, Somerset, for the Rev. B. Hurman and committee. Messrs. E. Habershon, Brock, and Webb, architects:—

Shorney	£910
Kitch Brothers	790
Paddon	767
Hartree	750

CHUBBY (SALOP).—For erecting a new farmhouse and buildings at Lower Lane. Mr. E. Powell, architect. Quantities supplied:—

Lockley and Ward	£1570 0
Woolley	1039 0
Evans	995 10
Hankinson and Williams	945 0

COVENTRY.—For building new Baptist Chapel Schools at Coventry. Mr. John D. Webster, architect, Sheffield. Quantities supplied:—

Hewitt	£2560 0 0
Woff and Kendall	2400 0 0
Marriott	2378 0 0
Norwood	2250 0 0
Trow and Sons	2200 0 0
Makepeace	2108 0 0
Claridge	2070 0 0
Bennett	2063 3 0
Haywood	2000 0 0
Wilson	1900 0 0
Hallam and Co. (accepted, with slight modification)	1900 0 0

COWFOLD.—For works at Cowfold, Sussex. Messrs. E. Habershon, Brock, and Webb, architects:—

Keys	£3305
Manley and Rogers	2790
Simpson	2675
Hatten	2523
Wilcox and Spurgeon	2395
Bland	2348
Bish	2277
Nightingale	2267
Pengoe	2247
Hall	2245

DARTFORD.—For new Wesleyan School, &c., at Dartford. Messrs. Pocock, Corfe, and Parker, architects:—

Lathey	£1780
Sharp	1129
Gumbrell	1025

GRAYS (ESSEX).—For the erection of a village residence for Messrs. Sturgeon and Sons. Mr. D. A. Cobbett, architect. Quantities supplied by Mr. George Mortimer:—

Harris	£2620
Rivett	2530
Crabb and Vaughan	2455
Hall	2347
Forrest	2269
Blake (accepted)	2265

HARTFORD (BERKS).—For parsonage house. Mr. H. Woodman, architect:—

Dover	£1600
Bland	1499
Matthews	1486
Wheeler	1400
Lovatt	1319
Wheeler Brothers	1192

LIVERPOOL.—For alterations at the Church of St. Francis Xavier. Messrs. Picton, Chambers, and Bradley, architects. Quantities supplied:—

Haigh and Co.	£5350
Westmorland	4898
Mullen	4799
Urmson	4654
Jones and Son	4649
Hughes	4590
Callie	4510
Rowe (accepted)	4444

LONDON.—For alterations and repairs at 310, Strand, for Mr D. Lane. Messrs. Clarkson, architects. Quantities not supplied:—

Emery	£785
Howard	685
Macey	678
Stone	650

MAIDENHEAD.—For the restoration of White Waltham Church, Maidenhead. G. E. Street, A.R.A., architect:—

Rogers and Booth	£4180
Silver and Son (accepted)	3969

NOTTINGHAM.—For the County Court. Mr. Thomas C. Sorby, architect. Quantities supplied by Mr. J. Scott:—

Hall	£6280 0 0
Barke	6250 0 0
Huddlestone	6188 0 0
Simpson and Co.	6078 0 0
Marriot and Co.	5880 0 0
Dennett	5879 0 0
Bell and Co.	5839 10 0
Stephenson and Co.	5698 0 0
Johnson	5650 0 0

WINCHMORE HILL.—For a wing to Beaumont Lodge, Winchmore hill, Middlesex. Mr. J. H. Rowley, architect. Quantities by T. T. Green:—

Crabb and Vaughan	£1354
Field and Sons	1226
Rivett	1213
Bayes	1191
Shepherd	1129
Patman	1084
King and Sons	1071
Smart ton and Cole	1048

WOLSTANTON.—For three houses at Wolstanton, near Burslem, for Mr. Clement Marsh. Mr. Geo. B. Ford, architect, Burslem:—

Sutton	£2818 14 0
Woolrich	2822 4 3
Bennett and Cooke	2766 0 0
Brindley and Critchlow	2560 0 0
Blackhurst	2486 0 0
Bowden	2432 0 0
Newton	2020 0 0

PROPERTY SALES.

APRIL 27.

By Mr. J. T. NEWMAN, at the Guildhall Coffee House—Freehold building land, on the Harold Wood estate, Essex, in lots: lot 19, sold for £305; lots 36 to 39, £130 each; lot 40, £300; lot 47, £85; lots 48 to 52, £80 each; lot 60, £125; lot 61, £80.

APRIL 28.

By Messrs. DEBENHAM, TEWSON, and FARMER.—Leasehold residence, No. 1, Rectory place, Rectory road, Stoke Newington, annual value £45 per annum, term 32 years unexpired, at £6 per annum—£320.

Leasehold business premises, Nos. 255 and 256, Tottenham court road, also stabling in the rear, let on lease and producing £138 10s per annum, term 99 years from 1798, at £8 per annum—£1,610.

Leasehold residence, No. 10, Fitzroy-place, Kentish Town, let at £38 per annum, term 72 years from 1799, at £6 6s. per annum.—£115.

Freehold ground rents, amounting to £163 14s. 6d. per annum, secured on 39 houses in and near the Old Kent road—£3,400.

Leasehold cottages, Nos. 5 and 6, Sussex place, Ferdinand street, Hampstead road, producing £39 per annum, term 55 years unexpired, at £3 10s. per annum.—£165

By Messrs. HARDS, VAUGHAN, and LEIFCHILD.—Freehold cottage, situate at Horton Kirby, Kent, let at £9 2s. per annum.—£105.

By Messrs. OWEN and JAMESON.—Leasehold two residences, Nos. 52 and 54, St. Paul's road, Camden Town, producing £104 10s. per annum, term 76 years unexpired, at £17 per annum—£1,155.

By Messrs. WARLTERS and LOVEJOY.—Freehold building estate, known as the "Annerley Tea Gardens," Annerley, consisting of 6a. 2r. 31p. of land, and 1a. 0r. 27p. of water, together with the buildings and erections thereon—£5,050.

APRIL 29.

AT THE MART—By Messrs. CHINNOCK, GALSWORTHY, CHINNOCK, and Co.—Freehold house, No. 29, King street, Cheapside, let at £120, subject to an annuity of £52 on four lives—£1,260

The Rocks Estate, near Bath, a fine freehold residential property, comprising an Elizabethan mansion and 839 acres of land—£31,000.

Nine lots of reversions, life interests and annuities, belonging to the late firm of Overend, Gurney, and Co. (limited).—Lot 1, sold for £7,150; lot 5, £3,500; lot 6, £1,800; lot 7, £500; lot 8, £5,350; lot 9, £2,100; lot 4 (sold before the sale), £6,300; total for all the properties, £78,960.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

George William Bodda, Thornton-heath, builder, May 27, at 11.—Edward Henry Cogswell, Hatfield Broad Oak, builder, May 27, at 11.—Michael Mason, Cambridge, contractor, May 27, at 11.—George Purser, Leighton Buzzard, plumber, May 5, at 2.—Henry Vere, Kensington Park, builder, May 8, at 12.—William Henry Dowland, Ramsgate, builder, June 1, at 11.—Benjamin Froud, Wandsworth-common, builder, May 8, at 2.—William Green, Hayes, Middlesex-road, contractor, May 9, at 12.—William Nunn, Hanover-street, Peckham, builder, June 1, at 11.—Elizabeth Steddy, Howard-road, Stoke Newington, builder, May 9, at 12.

TO SURRENDER IN THE COUNTRY.

George Arthur Cates, Bristol, engineer, May 8, at 12.—Banks Ebbritt, Great Staughton, plumber, May 7, at 2.—John Senior, Wombwell, near Barnsley, joiner, May 7, at 11.—John Robinson, Woodhouse, near Leeds, bricklayer, May 7, at 12.—John Whittle, Peterborough, builder, May 9, at 11.—Thomas Willan, Chorlton-on-Medlock, contractor, May 5, at 9 30.—John Batty and Stephen Wake, Middlesborough, builders, May 11.—Joseph Gore, jun., Herne Bay, contractor, May 12, at 12.—William Mason, Manningheath, Sussex, builder, May 4, at 11.—Thomas Ralls, Cardiff, builder, May 8, at 11.—Josiah Stantau, Portscatha, Cornwall, builder, May 11, at 4.—John Hardy Stothard, Morton, near North Shields, joiner, May 12.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

May 28, G. Philo, East India Dock road, timber dealer.—May 25, S. E. Marples, Ramsgate, surveyor.—May 20, F. Young, Brynmawr, railway contractor.—May 6, S. Heyman, Torquay, builder.—May 19, T. Johnson, South Stockton, builder.—May 28, H. Barfoot, Princes-road, Nottinghill, slater.—May 15, C. Field, Hereford, bricklayer.—May 18, J. Jefferson, Blackburn, joiner.

DIVIDENDS.

May 25, Sir S. M. Peto and E. L. Betts, Great George-street, Westminster, contractors.

DECLARATION OF DIVIDENDS.

W. Mowbray, Leicester, engineer, div. 8d.—J. Heatley, Whitehaven, plumber, div. 10s.

SCOTCH SEQUESTRATION.

John Ewen, Glasgow, contractor, May 1, at 12.

PARTNERSHIPS DISSOLVED.

Smith and Jackson, Huddersfield, brickmakers.—The Nottingham Mills Company, timber merchants.—Williams and Watkins, Helston, plumbers.

THE BUILDING NEWS.

LONDON, FRIDAY, MAY 8, 1868.

ARCHITECTURE AT THE ROYAL ACADEMY.

ARCHITECTURE, we are sorry to say, cannot sing a Jubilate in this the centenary year of the Royal Academy. It has taken nearly a hundred years to do it—such is the vitality of our art; but the academicians have very nearly strangled Architecture amongst them, and if we are to take a diagnosis of its condition from the presentment here set forth, we must declare that it is indeed in a moribund state. Perhaps, fortunately, we have another exhibition which reveals a very different state of things. We say perhaps, for we cling, in spite of many cogent reasons to the contrary, to the opinion that a union of the arts would be good for all, and we think that, whilst the title of the Institute is that of the Royal Academy of Arts, the parent art of Architecture should be more hospitably received and better treated. We, alas! are old enough to recollect the time when good men thought it an honour to find a place for their works within these walls, when one of the rooms was known by the name of the Architectural Room, and when the annual exhibition was a fair illustration of each year's progress; but we have seen Architecture kicked out of its old snug quarters, and made to wait like a lackey in the ante-room, turned out like poor old Lear by ingrate children to perish in the cold, and next year we expect to find it somewhere amongst the umbrellas and walking-sticks. We know it will not be turned loose in the porticos, because the sentries posted there might seem to do it honour, and this evidently is not the object of the painters. In a year or two a new home will be found for this society, and with a new home we trust a new and truthful name will be found. Let them then call themselves the Society of Oil Painters; they may even take the epithet Royal, if they will, but, in the name of all that is honest and truthful, do not let them hypocritically dub themselves, as they now do, the "Royal Academy of Arts." Watercolour artists have been driven from their rooms; sculptors they have buried, and architects they have condemned to death by the old and barbarous process *peine forte et dure*. How it is that so notoriously irritable a class as architects undoubtedly are could have stood this treatment so long has been a never-ending wonder to us, and that any will still continue to send their works is inexplicable; still we see a natural law working its way in spite of all human opposition, and the supply is limiting itself to the demand. Year by year the exponency of architecture gets weaker and weaker, and if there should be another year of it we may safely say it will have reached its weakest. This year's exhibition comprises 1,206 works of art, and of these forty-three are of contemporary architecture. We do not think that any comment of ours can put this fact in more forcible terms than this statistical statement, that only about one-thirtieth part of the exhibition is appropriated to our art, and that thirtieth in the very worst position. All this has wrought its bitter end, for even this small space is occupied with much that is worthless, and we have again to complain that the best men do not send at all, and those who do send do not send their best works. Of the forty-three drawings here submitted not half a dozen are worth the wall space they occupy. Numerically first amongst the architectural drawings (831) is Mr. T. R. Smith's "Brambletye, near East Grinstead," now erecting for Donald Larnach, Esq. The drawing is large and the landscape well put in, but the penn'orth of bread to all this sack is small indeed. Not but that the bread is wholesome; indeed, it is so good that, like Oliver Twist, we ask for more, and would far rather have seen somewhat more of the house and somewhat less of the district in which it is placed. At present we simply see an octangular staircase and a gable, both good in their way, but this is not very much to be given for all that large consumption of wall space. In 842, Mr. Gibson gives us an octagon "mausoleum of Sicilian marble and granite," erected in the Kensal Green Cemetery. Neither the description nor the design at all denote the quality or calling of the deceased thus lapidated. We are, therefore, left to form our own conjecture as to its fitness, and have come to the conclusion that the useful mission the thus-commemorated life was spent in was the practical furtherance of the noble science of gastronomy; for, by a delightful union of imaginative genius with archæological research, the design is that of the Abbot's Kitchen at Glastonbury, executed after the manner of confectionery; and though the idea may be pleasing, yet the effect is most appropriately heavy, and we feel that the well-worn Classic monumental inscription would be a desecration on this Christian monument.

The Paxton Memorial, which adjoins this, designed by Messrs. Goddard and Son, is a striking contrast, and together they afford a remarkable illustration of how many ways of going wrong there are in this world. Neither is good. This is long and thin, and that is short and thick, and, to use poor Hood's expression, "that's the long and short of it." Mr. D. Brandon's design for a mansion to be erected at Encombe, Dorsetshire, for the Right Hon. the Earl of Eldon, is a very simple and somewhat Jacobean building, of no particular merit, certainly not worth exhibiting. In Nos. 850 and 857 we have the interior and exterior of Miss Burdett Coutts' market in Bethnal Green, now approaching completion, from the designs of Mr. H. A. Darbishire. This very admirable work of charity disarms all criticism by its purport. We only wish the buildings were as unostentatious as the deeds of their donor, and we would rather have seen a good, well-ventilated covered market than the most picturesque of piazzas. We are sorry to say it, but it is a costly mistake, and in this case we prefer the will to the deed. Mr. G. E. Street, A.R.A., presents us with a most wholesome and satisfactory drawing and design. It is the exterior of the Convent of St. Margaret, East Grinstead (851), very simple and good, remarkable for an absence of all fussiness or striving for effect. The plan has developed the exterior, and the result is a truthful expression highly grateful to us after the masquerading we have been compelled to see so much of. The treatment of the entrance is noteworthy, and the honesty which could place its doorway from under the centre of the gable and the taste which could correct this irregularity by placing the niche to hold the image of the patron saint on the opposite side are alike commendable, and the introduction of the Holy Rood in the tympanum of the gable is very effectively managed. Above the rather low range of buildings forming the main front rises the chapel, apparently separated from a retro-choir or Lady chapel by some connecting buildings, but in the absence of the plan we cannot quite read this portion of the design; and above all this rises a circular bell tower of somewhat Spanish character, the least satisfactory portion of the design. Mr. G. G. Scott, R.A., sends an exterior view of the new chapel of St. John's College, Cambridge (852), which is not a pleasing production. It is exceedingly heavy, the apsidal chancel by no means harmonises with the square transeptal projections which occur at both ends, and the poverty of expression induced by the blank traceried windows in the easternmost of these is not worthy of an R.A. Mr. Ferry's church about to be built at Taunton is simple, and, if it had a better developed chancel, would be good. There seems to be a mania spreading amongst architects which developes itself in apses everywhere, and, much as we love a good apsidal termination to a long and grand chancel, we confess we very much dislike it when the chancel consists of the apse only, as in this case. Internally perhaps the chancel may continue so far as the western face of the tower, and thus help it, but even in this case, a square-ended chancel would have been very much better, and would have harmonised more with the other features of the design. The placing of the aisle porch at the extreme western end is a judicious expedient, as it prevents cutting the seating in two, but a better effect is obtained when a baptistery is placed westward of this, so as to prevent the very abrupt termination of the porch at the west end of the building. Mr. Parnell's design for the "Lawn front of Bushey Grove, near Watford, the seat of Edward Majoribanks, Jun., Esq." (856), is very Institution-like, with the regulation chequer work in blue bricks, the usual bay windows, and the unusual curved gables, which we had hoped had passed from the repertory of second-rate architects into the limbo of forgotten iniquities. Mr. T. T. Smith has a very good and simple little interior of a Benedictine Chapel at Nice (860), where an apsidal retro-choir is separated from the main body of the chapel (consisting of a nave only) by a simple reredos flanked by open iron grilles. Mr. E. M. Barry, A.R.A., sends some more bits of his restoration of Crewe Hall, which are very good in their way, but of course show no individuality or general progress; and Mr. M. D. Wyatt the interior of the India Office courtyard, which he exhibited in Paris, and which we then commented on.

Mr. A. Waterhouse sends us his best bit of his Manchester Townhall, the angle drawing, taken from the corner of Princess-street and Albert-square, and the which, as we have so recently commented on it, we shall simply point out to the visitor as a very admirable drawing, as may be seen by our illustration.

In No. 870 we have the interior of the Crimean Memorial Church at Pera, Constantinople, just completed from the designs of Mr. G. E. Street, A.R.A. This is very good and simple; the altar well raised, and backed by a simple reredos of inlay work bearing the symbol of our redemption, and flanked by slabs of marble separated by strips of mosaic work in the usual manner of wall-lining in the East. The circular window above this is of very severe type, and altogether the building is dignified, because it is not vain and fussy. The pulpit is somewhat obtrusive and overdone; but the two drawings which Mr. Street contributes show far more of the real spirit of architecture than any others in the room. Mr. Law sends an ordinary French château in very red brick and white stone, with a British propensity to bow windows, of no merit as a work of architecture, but a very admirable drawing. By the same colorist is 875, House at Coombe Lammas, Esher, designed by Mr. F. Wallen, a most extraordinary specimen of architectural fooling, being a heap of incongruous materials put together in the most abominable form. It makes us almost weep to see such beautiful work thrown away on such a subject. Mr. M. D. Wyatt's design for Mr. Huth's house at Passingworth seems to be largely composed of conservatory; what building we see is good and simple. Alleyn's College, Dulwich, as finally arranged, and now in course of erection from the design of Mr. C. Barry, is a curious mixture. We know its detail is very fine, but as a whole we do not like it.

Mr. Cockerell's design for "Sir Roger Cholmeley's school at Highgate" is very unworthy of his abilities; his having, by external pressure, been compelled to produce is possible, but that he should exhibit it passeth all understanding. There is little else to see

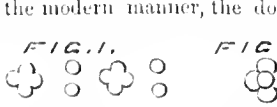
or say. Mr. Burges sends a sketch of the west doorways of "Cork Cathedral," which is "skied" so high we cannot read it. Mr. D. Brandon is even more unfortunate than usual in his "Eagle Insurance Offices," and Mr. Edis has stolen one of Mr. Barry's hotel designs and knocked it into some "New Mansions, Bayswater-road" sadly. Like the little boys we have, however, saved a plum till the last, and in Messrs. Godwin and Crisp's premiated design for the new townhall, Bristol, we have a very healthy and vigorous attempt. The lower storey is boldly treated in blocked masonry, its centre pierced by a simple doorway, and three two-light couplets flank it on each side. Above this is a rather singular range of small windows, forming a continuous panelling, the spaces required for support being filled in with figure sculpture; this feature is more novel than pleasing, and somewhat detracts from the massive dignity which pre-eminently distinguishes this design. The principal storey is well composed, consisting of a series of windows having plain traceried heads, and surmounted by pedimental canopies divided from each other by sculpture. The tower is very singular, and would be much more effective in work than appears by the drawing. From these same able artists, we have a couple of gateways at Castle Ashby, and a sketch of Glenbegh Towers in course of erection near Killarney, which is hung too high for criticism. Mr. Kerr sends a porch for Bearwood, Berks, in which Thorwaldsen's "Night and Morning" are tried to be turned into brackets with signal failure,—they do not even seem to be able to carry themselves. As to the other drawings they form a residuum, and must not complain if it finds no representation in our columns. We do not care to crush the weak. Of past architecture we have some good renderings, but Mr. Dobbin is not equal to last year. Mr. Phené Spiers contributes three admirable drawings, but these do not come under our present consideration, and we are much too dispirited with the painful task we have performed to be in the vein for pleasure; so with a heavy heart we descend the steps and wander away wondering why it is so. We have great and good men amongst us, a higher range of architectural talent now than England ever had before, a heartier appreciation for our art is manifest each year, and yet we have allowed ourselves to come to this. If architecture is to be represented at all, it should be fairly so, and we call on the profession either to withdraw entirely from the so-called Royal Academy of Arts, or to put their shoulders to the wheel, and with right good will push on until they have made its name a truth.

THE MUSEUM OF BUILDING APPLIANCES.

WE propose to commence a review of the contents of the Museum of Building Appliances in Maddox-street, with an examination of the tile and mosaic floors and other surfaces in plain, encaustic, majolica, and other ware there exhibited. Copeland's works seem first to call our attention, not from the quantity he sends, but his name is a power, and we wish that as much could be said for the beautifully delicate drawing and colouring in those he exhibits, which are intended for fireplace and wall decoration. Such an intense horror of positive colour appears throughout the collection that it is necessary to examine some parts very carefully to realise the exact tint aimed at; and when it is remembered that all these half tones (for colours they certainly are not) are for the interiors of our dark rooms, we cannot but ask for something a little stronger. Some hexagonal tiles of blue and buff grey for stable floors are still of the same delicacy of tone as those intended to be used in the decoration of rooms. Whilst we speak so freely as to the taste shown in these magnificently made productions, do not let it be supposed that we wish to say aught but what is respectful concerning their make, which is exquisite. The glaze of every tile is as smooth to the hand as glass; each tile is so exactly like its fellow that to even wish for a difference would in Staffordshire be considered a sin.

As a curious illustration of the difference in manner and tone of thought between the manufacturers of to-day and those of past days, we might mention some Dutch tiles in the jambs of a very eccentric grate near the Maddox-street entrance of the museum. Each of these tiles has been drawn by hand, and although but in one colour (blue, with white for the ground), and although the drawing is rude, and the figures dressed in flap hats, jerkins, and knickerbockers, with all these drawbacks, no person who possesses any feeling for colour could walk direct from these homely but earnest attempts to render what the artist and workmen knew to the modern productions before spoken of, which are so perfect in their way, and yet so unsatisfactory in their result, without drawing unfavourable conclusions as to the taste and energy of the latter. To argue that they are made to suit the tastes of purchasers, and to harmonise with the furniture of our rooms, is but to say, so much the worse for the taste of the purchasers and their furniture. Some modern "imitations" of the old Dutch tiles are in the upper gallery of the museum, but then they are unlike them both in colour and drawing. The largest exhibitor is Godwin, of Lugwardine. In some tiles made for Hereford Cathedral his imitations of the texture and colour of old encaustic tiles are wonderful, whilst in fracture the pattern appears to be inlaid at least 1-16th of an inch thick. This is an important matter, for in some inferior tiles that we have seen the pattern was so thinly inlaid that a sharp blow cracked them at once, and if the clays forming the several colours are not of precisely the same substance they do not contract equally in burning and cannot make a lasting material. It is certainly strange that the practical advantages connected with some of the peculiarities of these imitations of old tiles by Godwin never seem to have occurred even to the maker. Take, for instance, the slightly roughened surface, which if merely looked at from the common-sense view of comfortable foothold certainly ought to be one of the considerations in a pavement and must be a point in their favour. Let anyone who doubts this spend some time in the new galleries of the South Kensington Museum. If he wear good stout walking boots he will come to the conclusion that either his feet or the pavement ought to be "roughed." Then the play of light and the chance of their being some diversity of tint where the surface is not at such a dead level ought also to count for something in favour of such an alteration. As an instance of how a pattern may be carefully imitated, whilst the spirit that dictated its design may be utterly lost, take a border tile from Hereford, buff on a red ground (fig. 1). This is simple and effective, but in some tiles made by Godwin, after the modern manner, the dots are made

FIG. 1. FIG. 2.



white, and a white dot is inserted in the centre of the quatrefoil (fig. 2), utterly destroying the breadth and simplicity of the old pattern, and, indeed, vulgarising it.

Some green and black pattern tiles are very good in colour, and would, if very cautiously used, give great richness to a pavement. Maw and Co. also send some well-made tiles, but those for floors have the same fault of flatness of treatment and dulness of tone before mentioned in other manufacturers' works. There are several grates designed by Bodley, Webb, Truefitt, and Waterhouse, and manufactured by D. O. Boyd. Their make and other peculiarities will be reserved for future consideration, but at present the tile filling in of the jambs comes under our attention. The grate designed by Mr. Bodley, and which has old Dutch tiles in the jambs, has been alluded to. Mr. Truefitt's grate has some black and yellow tiles forming the back, sides, and hearth, the yellow being noticeable as apparently an attempt to imitate the old majolica yellow, and is very praiseworthy, but there is still a slight rawness in the tone that must be conquered. The back hearth is raised about 2in. above the front hearth, the advantage of which is not very clear, whilst the nosing of the riser being formed in tiles would be very likely to chip. The general tone of colour in these last-named tiles is a decided improvement upon those used in Mr. Webb's grate, where black and red tiles, with a buff and red border, are laid down for the hearth. It would have been much better to have kept the centre one colour, say red only, the border being at present discordant with the rest. Mr. Waterhouse, bolder than the two other gentlemen, has used many more colours, but with great loss of harmony and repose. Godwin and Maw both exhibit majolica tiles for fireplaces in several colours. The tints might have been more harmoniously chosen in some cases, but some of the patterns of both manufacturers are very good indeed. One error in their make ought to be pointed out, and that is in the raised surfaces, many of them having a sharp angle in the bed. This would make them difficult to clean, and in some measure neutralises the advantages gained by their use. Amongst the tiles exhibited by Maw and Co. there is one pattern in white, green, blue, and buff, a flat glazed tile for wall surfaces, treated with a chintz-like pattern. This is very free in drawing, and a great improvement upon many tiles made for the purpose.

Messrs. Minton do not appear as exhibitors, but their white tiles are used in lining the lavatory, and cause the question to arise, why are our white tiles always such a dead white? Put beside them a so-called white tile of Dutch manufacture, and the Dutch work will look quite yellow by contrast, and in consequence of this small amount of colour in them, they never, when used to cover large spaces, give such a cold appearance as the English work. Some of the narrow courts in Austin Friars, lined with Dutch tiles, are case in point.

Whilst remarking upon the choice of tints, there is another colour about which a few words might be useful, and that is the blue as used by all our tilemakers. The tone which they all affect is French blue, a cold colour in itself, and one difficult to harmonise with others. If some warmer tint were aimed at, such, for instance, as the blue upon gris de Flandres ware or in Neapolitan tiles, it would take much from the hardness of the patterns. This hard metallic blue is certainly not used because of any mechanical difficulty arising to prevent other tints being used, but probably has grown out of the attempt to imitate so called Gothic colouring, and this might be all very well in a church, or where strict mediæval treatment is desired, although the reason for its use, even in this case, remains to be proved; but where rich and harmonious colouring, unfettered by archæology, is tried for, certainly the best tint obtainable ought to be used, and for floor or wall decoration a sky-blue is not the best for the purpose. Somewhat similar objections may be raised against the buffs and greens. There are great difficulties in obtaining good tones of the latter colour, but the buffs still leave much to be desired. They would have much more life in them if they were a little more yellow in tone.

Before leaving the subject of floors some terra cotta, grey and red pavers, exhibited by Blashfield, claim attention. They are very pleasing in tone of colour, are thoroughly well burnt and made, are cheap, and are well adapted for their intended purpose—stable floors, or courts, and office paving—and their wear would be very even and satisfactory.

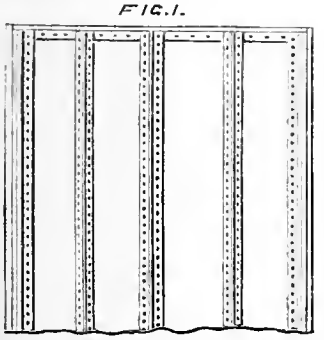
ELEMENTS OF ENGINEERING.

Caissons.—I.

FROM piles to cylinders, and from cylinders to caissons, are but stages of progress in subaqueous foundations.

A cofferdam enclosing a pier is nothing else than a caisson composed of a multitude of parts, instead of consisting of a few divisional sections. So long as timber piles were the only means of enclosing a water-tight area, there was no other resource but to form dams in the manner selected, and make them as staunch as the circumstances of the case would permit of. Partly owing to the introduction of iron and the success which attended its employment in the hollow or box shape, and partly to the increased dimensions required for all future bridges, which rendered the formation of a cofferdam upon the old pile system a work of great labour, uncertainty, time, and expense, engineers commenced to seek another principle of construction, which would afford the same result in considerably less time. The object to be achieved was, the surrounding of a certain space below the level of high-water mark with a water-tight casing, and manifestly the point to be aimed at was the accomplishing of the task with as few individual or separate portions of material as possible. Wrought iron was found to answer the purpose best, and this modern method of sinking foundations has met with well deserved success at the works of the new Blackfriars Bridge. The chief particulars claiming our attention are, the construction or mode of putting the caisson together, whether in separate divisions or in the whole, and the manner of sinking them down to a firm and solid substratum. As the ends of the piers of a bridge in a tidal river like the Thames will be both furnished with cutwaters or starlings, the end sections of the caisson will be of a different shape to the central ones, but the principle of its build will be identically the same. For the sake of example we have selected one of the central sections of a caisson, which is, in fact, a rectangular box open at both ends, and composed of wrought-iron plates, angle, tee, and stiffening irons. Fig. 1 represents an elevation of a portion of

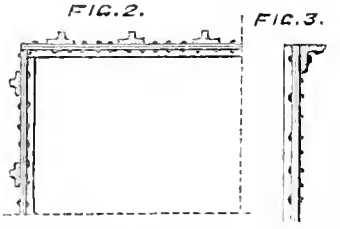
FIG. 1.



it, in which the plates and connecting irons are shown riveted up. The tee iron stiffeners which run longitudinally upon the sides may be placed either upon the outside, as shown in the figure, or upon the inside. It must, however, be borne in mind that this arrangement is not admissible in those portions of the caisson which are intended to be sunk below the bed of the water, as the obstacles offered to the free penetration of the substratum would be seriously increased by any projecting angle or tee irons. The outer surface must, in those lower sections, be perfectly smooth and flush, and all flanged ironwork that may be necessary either for the absolute strength or the rigidity of the caisson must be placed inside. Cases might arise, where the ground was of a very hard, impenetrable character, in which it would be advisable to countersink the heads of all the rivets showing upon the outside, but this would be attended with a good deal of extra trouble and expense, as an extra price per ton is always charged by contractors for ironwork if there is any departure from simplicity and plainness in the general character of the work they tender for. It is not to be understood by this remark that the necessity for countersinking the heads of a few rivets in a large design would suffice to increase the price of the work per ton, but simply that there should be no undue proportion of extra labour entailed. As a rule, a few rivets in every bridge are countersunk, generally under the bottom flanges, when the girders bear upon the bed plates over the abutments. Sometimes, instead of this precaution being taken, grooves are sunk in the castings for the bed plates, so as to allow the heads of the rivets to lie in them, while the remainder of the flange rests down upon the raised part of the plates.

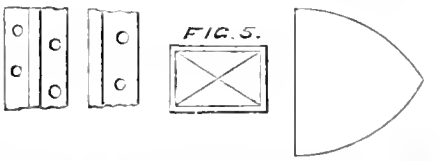
A portion of the plan of a caisson is shown in fig. 2, by which it is seen that the interior

FIG. 2. FIG. 3.



is preserved free from all diagonal struts or ties, in order to leave the maximum amount of room for the men to walk in, and also to allow of the passage of materials up and down. Frequently, however, it becomes necessary to temporarily strut the interior of the caisson to prevent it bulging inwards under the pressure of the water. Strong balks of timber are the best means of accomplishing this result. They can be readily fixed at any moment, can be easily removed as the masonry or brickwork is carried up, and can be used as often as required for a similar purpose. The necessity for strutting the caissons internally is usually confined to those sections situated below low-water mark, unless they have been constructed of materials of too small a scantling, which has occurred in one or two instances. The mistake of making the plates too thin should be carefully guarded against, for although the tee iron stiffening pieces impart much additional strength, yet they only act to the full extent at certain intervals, and, moreover, their assistance is bought at some sacrifice, since they cause a loss of material in the solid plate by the punching out of the holes to receive the connecting rivets. The chief use of all longitudinal stiffening irons, whether for caissons or plate girders, is to maintain the sides in shape, and so enable them to exert their full powers of resistance against the strains brought upon them. Against a direct cross strain tending to force the plates either inwards or outwards, they cannot be relied upon as possessing much value. Security against a direct lateral force similar to the action of the water upon the exterior of a caisson is best obtained by internal cross bracing and strutting, the use of which is attended with much difficulty in this instance, as we have already explained. A section through one of the sides is represented in fig. 3, showing the riveting of the tee irons to the plates. Unless tee irons of large scantlings are required, it is preferable to employ angle irons, as they do not occasion so great a loss of material by the insertion of rivets. Referring to fig. 3A, we observe that a tee iron, no matter how small its dimensions may be, requires a rivet upon each side of the central web, whereas an angle iron, having no central web, only requires one rivet in the same length of plate. The rivets attaching tee irons should always break joint, as shown in the figure, although it is a common plan to place them in the same line across the breadth of the iron, which weakens both the tee iron and the side plates as well. If we suppose the distance between the rivets situated upon each side of the central web of a tee iron when placed in a straight line to be two inches, and their longitudinal distance apart, or pitch as it is technically termed, to be four inches, then the line of fracture across the plate from rivet to rivet, when they are placed as in fig. 3A, is to that when they are

FIG. 3A. FIG. 5. FIG. 4.



placed in the same straight line across the tee iron as to 4 to 1. As the strength is directly proportional to the line of fracture, the advantage of making the rivets break joint is at once apparent.

The wedge-shaped form of the cut-water sections of a caisson, as represented in fig. 4, is evidently very favourable to its resisting powers. Its construction is similar to that of the central divisions, but owing to its curvature it is comparatively much stronger. In fact, it acts upon the principle of the arch, the two curved portions being regarded as the semi-arches, while the straight side acts the part of a tie and maintains the whole in equilibrium. A very usual form of curve for cut-waters is the one shown in the figure, where the chords of the arcs and the tie together constitute an equilateral triangle. Consequently, the horizontal thrust is not of any great amount, which lightens the strain upon the tie or straight side of the section. To save expense, the engineer of the new Blackfriars Bridge has employed the buckled plates to be used in the permanent roadway as a means of assisting in the construction of the temporary caissons, which purpose they answer exceedingly well. The strength of Mallett's buckled plates, and their advantages where lightness and a large area of surface are concerned, are too well known to need description. They have a small border or fillet round the edges, from which they gradually and uniformly rise, as shown in plan in fig. 5, to a point or crown. Upwards of 18 tons have been placed upon one of these plates without inducing any temporary, much less any permanent, deflection or set. They were extensively used in the superstructure of Westminster Bridge, and it is probably in consequence of the satisfactory results attending their employment there, that they have been selected to perform a similar duty upon another of our metropolitan bridges. There is a practical point to be mentioned with respect to sinking caissons in sections or divisions which has constantly puzzled the amateur and occasionally those who ought to know better, and that is how the joints between each division are made good. There has scarcely been a visitor to the works in progress at Blackfriars who has not asked this question, and the answer is very simple. A pile driven down tightly between the two sides makes all secure. Formerly it was the plan, regardless of the evil consequences likely to ensue, to draw timber piles after they had served the purpose of the dam for the sake of the wood. Such a course, it is needless to remark, would be not only equally culpable, but hardly possible, with a caisson. Those portions sunk in the bed of the river and up to the level of the water mark remain so and serve to enclose the solid contents in a perfect shell, as it were. The divisions above low water are disconnected as the work inside is carried up, and when once high water mark is passed, the whole of the caisson may be removed. Its duty is finished for that particular pier, and it may be transported to the site of another to similarly aid its erection. The methods adopted for sinking caissons are principally three in number, and the particular one to be chosen depends upon the nature of the substratum to be got through, and

other circumstances which affect various localities. No absolute rule can be given on the subject, except that where possible, sinking by dead weight, owing to its simplicity and cheapness, is the method to be preferred. We must reserve for our concluding article the descriptions and applications of the three methods ordinarily employed in sinking caissons.

THE EARTH SYSTEM.

To the Editor of the Building News.

Sir,—In reply to Mr. Girdlestone, I am acquainted with the whole process adopted by the Earth Closet Company; nay, more, some fifteen years ago I carried it out in every particular, with the exception of depositing a cartload of the earth, which had passed the closet, in a cellar. That idea, I confess, which is quite original, had never occurred to me. I submit, however, that on a matter of such grave moment we require more evidence, and evidence of another kind, than that supplied by a trading company, and which is merely the result of experiments conducted on their own premises and under their own supervision. We require evidence of the process having worked under the ordinary circumstances water-closets have to meet. The Wakefield prison is a case more in point. I know something of that too, but lest I should be accused of misstating the facts, I will ask Mr. Girdlestone to supply us with them—how long have they been in action? how many closets and how many inmates? what supervision is there? and, indeed, all the items of information which may assist us to a judgment. This is all material, but I will remind him that no one has disputed that the earth system is applicable to certain situations, and if it be so in any class of cases, prisons and workhouses are the most likely ones. The question is not, however, whether they can be made to act in certain circumstances, but whether they will act as well or better than the water-closets they are intended to supersede. Unless this is proved, nothing is proved; and I maintain that wherever a water supply exists the water system is, on the score of decency, economy, and health, decidedly the best. This is really the issue to be tried.

I scarcely know what to say to your correspondent "E." I apprehend that he occupies a high stool in an office over the cellar where that cartload of clay mixed with excreta is placed, that he imbibes the floating ammonia without knowing it, and that the fumes have made his perceptions rather giddy, and this must be his excuse. His letter is a perversion of my statements, and where such liberties are taken in quoting sentences and parts of sentences, and dovetailing them in positions to suit his purpose, it is, of course, easy to make a writer guilty of inconsistency, inaccuracy, ignorance, or of any folly or contradiction. This may be ingenious, but it is not honest. Surely we do not adopt a *laissez faire* policy in admitting that there is a great waste in passing the refuse of our habitations into the rivers because we do not immediately accept a crude system, which after all only proposes to deal with a small part, and that the least valuable, of the refuse. The statements made by me are the results of actual experiment made by scientific men in dry closets with my assistance, every one of whom had a desire to bring about a success, and had every motive to do so but that perhaps of direct pecuniary gain. I attach no value whatever to the testimonials extracted and given by your correspondent "E," for we all know how easily they may be obtained, and how lightly they are looked upon by men of discernment. Such as are quoted do not invalidate any statement I have made. I am not desirous to vindicate my skill in chemistry, for I am no chemist; but the experiments carried out in my presence show that the solid and fluid excreta, mixed with earth, are mere mechanical mixtures and not a chemical combination, and that the work of assimilation does not properly begin until the agencies of the sun and air are brought to bear upon them. The earth so used is a mere absorbent.

All this is little to the purpose, and I must apologise for being drawn away from the main argument. If we grant all that the advocates of earth-closets demand it brings us very little nearer to the desired end. There are two propositions before us; each is of vast importance—first, that of conveying away, without offence and without injury to health, the refuse of human habitations, and, second, to apply it as nutriment to the land. The first I hold is the one of paramount importance, to which all other considerations must yield, that upon which health, and consequently human happiness, so much depends. The saving of the soil, important as it is, is only a secondary matter. There is, I assert, no difficulty about the former; that problem is already solved by the introduction of the water-closet system, but the problem remains as to the second—how, in fact, to make the two work in harmony. We will look at the case of water-closets a little more minutely. In this contrivance everything committed to it is at once conveyed away from the house to the sewer, and the return of offensive gases is prevented by the trap. The drain pipe, which exists for the purpose of carrying away the liquid refuse of the house, and which cannot be dispensed with even were the earth system adopted, conveys away the deposits. There is nothing for the person using it to do but to pull a handle, and nothing for servants to do. The water is conveyed to a closet by a pipe from the main or from a cistern, and the refuse carried away without any menial labour being required, without the carriage of offensive matter along corridors and stairs. It is simple, inoffensive, economical, and decent. I am now speaking of arrangements on a correct principle, and not of the wretched contrivances of which I have already, in my former letter, spoken, and which do not deserve the name of water-closets. We are told, however, that water-closets are liable to all sorts of accidents and disasters, that they smell offensively, that they are sometimes frozen and often out of order, and that a certain class of diseases has assumed a more malignant form since their introduction. In fact, some very bad closets are taken, and these are given as examples of the water-closet system. This is not the way to serve any cause, and the course pursued is flagrantly unjust. The worst class of closets is taken and presented as a sample of the whole. A man diligently seeks for a bad orange in a basket and cries out, look! what bad fruit! This is exactly what the advocates of earth-closets are doing. They find instances where closets have no water, where the overflow pipe of the water cistern empties into the soil pipe, where the traps are defective, where a supply pipe has been frozen, and where rats have entered, and they cry, lo! here is your water-closet system! This is the vendor of an inferior kind of orange producing a rotten orange as a sample of his neighbour's fruit. None of these things belong to a water-closet system, they are the results of ignorance, neglect, and dishonesty. I have a house with a water-closet on every floor above the basement, one above the other, four in number; I rebuilt the house seven years ago and so constructed it. I have never had one frozen, I have made it impossible that a rat could get in or find shelter, I have never had any of them in a condition that a person going into them blindfold could tell whether he was in the closet or in a bed-room, and the whole repairs have not for that term cost me forty shillings. Of course I took care at the outset to have everything carefully considered and properly carried out, to select closets of the simplest construction and of the best workmanship, and to have them well fixed. My closets are all ventilated, the traps all communicate with the outer air by an air pipe, and thus I have neither trouble, inconvenience, nor expense, and have had no disease that could be traced to malaria. The overflow pipe of the water cistern communicates with the rain water pipe, so that both shall aid in flushing the soil pipe, but so arranged and trapped that no effluvia can be brought back into the water cistern. It must be remembered that the water cistern is itself an evil incidental to an intermittent supply, but the water-closet is in no way responsible for this. I can point to hundreds of instances where the water-closets are equally efficient and inexpensive, and what has been done in these cases can be done in all, if the same precautions are taken.

I expect that water-closets, like any other mechanical contrivances, are liable to wear and tear and to accident. We are not seeking an arrangement that will be entirely free from defect, but one that is less so than others, and in water-closets especially we desire to find that system which will require the least attention on the part of those who use them and least liable to derangement. This is attained by our present system; it is the best known to us, and the earth system cannot equal it in simplicity, nor in any other way. What have we to do in cities if we adopt the earth system? We have to dispense with our present appliances in the shape of water-closets, which will be an expensive matter, and then what do we get? Simply a piece of mechanism [I grant that may be made exceedingly simple, but not more simple than a water-closet, and of those I have seen that patented by Mr. Carrick, of Glasgow, is the most complete], but one that, equally with the water-closet, is liable to derangement from use and accident. The manipulation is greatly increased, for the hopper must be filled; it does not matter at what intervals it requires to be filled. The receiver must be emptied, and it is very easy to calculate how often that operation will be necessary in a family of five persons. Some place must be found to store it until it can be carted away, and really we must not be told that it is quite a safe and convenient method to make a store room for an indefinite period in a cellar of the house for the mixed earth and human excreta. It is simply disgusting and absurd.

After all this, what has the earth system done towards meeting the great evil of polluting our rivers and streams with that which ought to be food for the land? They take away the solid portion and some portion of the fluid parts of the human excreta, and they leave nine-tenths of the refuse of the house, with a large portion of urine (that from the bed-rooms), to find its way into the sewers, and from thence into the rivers. They exclaim against irrigation, but they do not tell us what we are to do with this large bulk of refuse that does not go into their earth-closets. They are silent on another matter. They do not tell us how it happens that the earth, which acts, as they say, chemically and rapidly upon refuse matter, so as to make it as inoffensive as sea sand, should not have the same effect when the refuse is thrown upon it in a fluid state, when in addition to the earth there are the roots of plants hungry for aliment, and the agencies of light and air to assist the assimilation. I admonish them in no unfriendly spirit to deal with this matter fairly. There are purposes to which the earth system may be adapted, and there are plans of carrying it out to which they have evidently paid no attention. It is a practical question of no great difficulty, and will not be solved by putting the supposed advantages of their own system against the acknowledged errors in carrying out another. This Cheap Jack method of securing public attention will only bring discredit upon themselves.—I am, &c., B.

P.S.—I have a little more to say in another letter, if you can afford me space, as to irrigation.

A NEW VENTILATING STOVE IN USE FOR BARRACKS AND MILITARY BUILDINGS.*

THE fireplace about to be described dates from 1859—60, and was designed to meet the conditions laid down by the Barrack and Hospital Improvement Committee at that period, and which aimed at supplying at all seasons every room in a building, by itself, and independent of the other rooms, with a sufficiency of air, and at the same time to prevent the temperature from falling below a desirable point. The committee, not being satisfied with the form of grate already in use, adopted the fireplace which this paper is intended to describe. The stove, which is not patented, is made of the best cast iron and consists of three pieces, connected by screws. The first piece forms the moulded projecting frame, the second the body of the grate, and the third the nozzle or connection with the smoke-flue, the bottom flange of which is bolted to the back of the grate. The stoves are made in three sizes. The fireplace has a lining of clumps in five pieces—two sides, one back piece, and two bottom pieces. A clear space half an inch deep is formed between the back lump and the iron back to receive a supply of air through the ash-pit, which passes through a slit in the fire lump immediately above the fire. By this means a more perfect combustion of the smoke is effected. The flame, heated gases from combustion, and small amount of smoke as exists are compelled to impinge upon a large heating surface, so as to subtract as much heat as possible out of them before they pass into the chimney, and the heat thus extracted is employed to warm air taken directly from the outer air. The fresh air when warmed is passed into the room by a flue near the ceiling. The flue, which has been adopted for barracks, is carried up by the side of the smoke flue in the chimney breast. The grate (No. 1 size) will contain about 18lb. or 20lb. of coals; 40lb. will maintain a good fire for 16 hours, that is, at the rate of about 2·5lb. per hour.

In new buildings it would be very desirable to carry up the smoke flue inside the warm air flue, and so extend the heating surface. This plan was adopted in the wards of the Herbert Military Hospital, where the fireplace is in the centre of the ward, and the chimney consequently passes under the floor, and by this means an additional heating surface of 36 square feet has been obtained. The limit to which the heat from the fire can be so utilised is the point at which it cools down the chimney so as to check the draught and combustion of the fuel. With respect to the application of the grate to existing buildings, the recess in which an ordinary fire grate would be fixed forms the chamber in which the air is warmed. The front of the stove can be easily removed, thus rendering the air-chamber accessible for cleansing purposes.

In applying the stove to existing fireplaces the air-chamber must be left as large as possible, cleansed from soot, and lime whited. Should the fireplace be deeper than 1ft. 6in., the depth required for the curved iron smoke flue, a lining of brickwork is built up at the back to reduce it to that dimension. The chimney bars, if too high, must be lowered to suit the height of the stove, or to a height of 3ft 3in. above the hearth. They must also be straightened to receive the covering of the air chambers These coverings should be of 3-inch York or other flagging, cut out to receive the iron smoke flue, and also to form the bottom of the warm air flue in the chimney breast. In new buildings the air chambers may be rectangular. They must be 4in. narrower than the extreme dimensions of the moulded frame of the stove, so as to give a margin of 2in. in width all round for a bedding of hair mortar.

General results of numerous experiments show that the air is admitted to the rooms at a temperature of from 20 deg. to 30 deg. Fah. above that of the outer air. The design of the grate was intended to preclude the possibility of such a temperature as would in any way injure the air introduced. The principle of these arrangements has been adopted for barracks in the case of grates for married soldiers: these would be useful as cottage grates. These grates have a small oven, and an open fire; warmed air is introduced into the room by means of an iron flue, carried up from the fire-brick lining of the stove inside the chimney, and introduced into the room near the ceiling through a louvred opening; by this means the heat of the smoke is utilised. This description of grate was devised for the purpose of combining a power of cooking for a cottage with great compulsory economy of fuel. It must, however, always be observed that in proportion as the heat is removed from the chimney, so is the draught, *i.e.*, the effect of the chimney as a pumping engine to remove the air, diminished, and the combustion of the fuel to some extent checked.

There is one point connected with the flue which must be carefully attended to, viz., the fresh air should be taken from places where impurities cannot affect it, and the flue must be so arranged and constructed as to afford easy means of being periodically thoroughly examined and cleaned. In barracks the rule is that such cleansing should take place at least once a year.

Now that the question of economy of fuel is becoming daily of more importance, it is desirable that we should adopt every means of utilising, to the fullest practical extent, the fuel which we burn. If this was done in all households the saving of fuel to the country and of money to individuals would be considerable.

In conclusion, the merits which are claimed for this fireplace are:—

1. That it ventilates the room.
2. That it maintains an equable temperature in all parts of the room, and prevents all draughts.
3. That the heat from radiation is thrown into the room better than from other grates.
4. That the fire-brick lining prevents the fire from going out, even when left untouched for a long time, and prevents the rapid changes of temperature which occur in rooms in cold weather from that cause.
5. That it economises fuel partly by making use of the spare heat, which otherwise would all pass up the chimney, and partly by ensuring by its construction a more complete combustion, and thereby diminishing smoke.
6. That it prevents smoky chimneys by the ample supply of warmed air to the room, and by the draught created in the neck of the chimney.

I believe that the principles adopted in these fireplaces are sound; they have been largely applied to military buildings, such as barracks and hospitals, and they have been recommended for introduction into workhouse wards. I recommend them to the attention of architects and builders, and I have the less hesitation in doing so, as there is no patent in question, and there is no one can claim any pecuniary interest in the manufacture of the grate.

* Abstract of a paper read before the Society of Arts on Wednesday evening by DOUGLAS GALTON, Esq., C.B., F.R.S.

THE WHITWORTH SCHOLARSHIPS.

We have been requested to give insertion to the following:—

THE INSTITUTION OF CIVIL ENGINEERS,
25, Great George-street, Westminster, S.W.,
2nd May, 1868.

SIR,

At the moment when it is considered by many that more systematized methods of instruction are necessary for those intended to follow industrial and scientific pursuits, you, Sir, come forward with the best practical help that could possibly be devised. In the learned professions numerous forms of endowment already exist; but for all those occupations which are intimately associated with the applications of pure science to the affairs of every-day life, hitherto there has been no such encouragement.

I have the greatest pleasure in being the medium of conveying to you the accompanying extract from the minutes of the Institution of Civil Engineers; and I am sure that the general feeling of your brother members is, that any words very inadequately express the sense of their indebtedness for your princely liberality.

I am, Sir,
Your obedient humble servant,
JAMES FORREST,
Secretary.

To
JOSEPH WHITWORTH, ESQ., F.R.S., M. Inst. C.E.,
&c.

At the ordinary general meeting of the Institution of Civil Engineers, held on Tuesday, the 28th of April, 1868, Mr. Charles Hutton Gregory, the President, being in the chair, the following communication from the Council was brought forward, was adopted by acclamation, and a copy ordered to be sent to Mr. Whitworth:—

"Attention having been called to the foundation, in perpetuity, by Mr. Joseph Whitworth, M. Inst. C.E., of thirty scholarships, of the annual value of £100 each, for the instruction of young men, natives of United Kingdom, to be selected by open competition for their intelligence and proficiency in the theory and practice of mechanics and the cognate sciences, with a view to the promotion of engineering and mechanical industry in this country, it was

"'*Resolved unanimously*,—That this meeting desires to record, on its own behalf, and on that of the members of all classes of the Institution of Civil Engineers, its grateful recognition of this act of munificence, and its high appreciation of the services which have thereby been rendered to the cause of technical education and national advancement, and of the advantages that may be expected to accrue, alike to the profession and to the community generally.'"

Signed on behalf of the Institution of Civil Engineers.
JAMES FORREST, Secretary.

ARCHÆOLOGY.

QUITE a puzzle for the archæologists has been found by the Rev. James Robertson, of Swinton, North Riding, who for some time past has been engaged in the examination of a mound of 70ft. diameter, situate close by the village, and within a few yards of the old Roman road from Eboracum to Praetorium. The mound is popularly known as "St. Peter's Liberty" and "The Intake," and was formerly enclosed, but is now part of the estate of Mr. Thomas Preston, of Norton, East Riding. The mound was opened in expectation of its proving a tumulus. This, however, has proved otherwise. After some weeks of digging, a cruciform excavation of 8ft. 9in. in depth, cut into the solid rock, has been exposed. The arms of this cross were to the cardinal points, were exactly of a length, measuring from N. to S. and from E. to W. 19ft., being 6ft. wide at the point of junction and 5ft. at the ends. The sides were perpendicular, and the bottom was a perfectly flat surface of coraline oolite. Upon this level bottom of the excavation was raised a platform, also in the form of a cross, the arms of which extended the whole length (nearly) of the cutting and were 2ft. in height and 2ft. wide. At the point of intersection was a large square block of calcareous freestone, and the whole of the platform was made of the same rock, in large blocks at the bottom and smaller stones upwards, all carefully placed. This rock crops out about a mile distant, and there is no other bed of it in the locality. The space between the sides of the excavations and the platform was filled with soil. Over all was a thick bed of beaten clay. Above this in ascending order the excavation was filled up with soil, containing Roman pottery, a Roman horseshoe (so thought), beds of clay and charcoal, quantities of mediæval pottery, burnt stones, slates (squared) of flagstone, with a hole bored in one corner, a worked bone pin, &c., and over all this a mound of about 3ft. altitude of soil, clay, and burnt stones. The use of this place, or the reason of its formation, is enigmatical. If formed in early times it must have remained open to the mediæval period, as evidenced by the pottery found. At present archæologists are at fault in arriving at a conclusion as to the nature of this relic. A very similar structure, but formed on the natural ground, with a mound over it, was found at Helperthorpe, on the Wolds, about 18 months ago, by Mr. William Lovel, of Scarborough. In that case the cross (platform) was formed of clay, supported by rough chalk walling, and that mound also produced Roman and middle-age pottery, glass, a horseshoe, bits of iron, &c. Doubtless, both are of a similar nature, whatever that may be.

A large legionary tablet, belonging to the wall of Antoninus Pius, has been found within the last few days on the property of Mr. Henry Cadell, of Grange, parish of Carriden, Linlithgowshire. This stone, which is of a large size, 9ft. in length by 2ft. 1lin. in breadth, is in a very perfect state of preservation. It is divided into three panels. The centre one contains the following inscription, carved in large clear letters:—"Imp. Caes. Tito. Aelio. Hadri. Antonino Aug. Pio. P. P. Leg. II. Aug. Per M. P. III DCLII Fec." The translation of this inscription was the subject of discussion for several days in the neighbourhood, until it was finally settled as under by the visit of some of the members of the Antiquarian Society:—"To the Emperor Cæsar Titus Aurelius Hadrianus Antoninus Augustus Pius—the father of his country."

On Tuesday evening last the opening *conversazione* of the Architectural Exhibition was held at Conduit-street. There was a numerous gathering. Mr. Beresford Hope gave an address, in which he spoke favourably of competitions limited and unlimited. He spoke of the exhibition as an improvement on preceding years, and called attention to Sir Charles Barry's drawings and sketches for the Houses of Parliament, the marvellous drawings by a French artist, to whom was awarded a gold medal in the late Paris Exhibition, and the other French drawings, and the competition designs of the Manchester New Townhall.

NEW PAVING FOR THE CITY.

A NEW method of laying granite pavement, which appears to have been attended with considerable success in Manchester, has been tried this week in Duke-street, Smithfield. The plan consists in laying the granite blocks in the ordinary manner, but instead of using a lime grouting to cement the stones, the interstices are filled in with a very coarse gravel, and a hot liquid cement of gas-asphalte is then poured on. The liquid asphalte so flown between the blocks to the bottom and firmly cements the pavement into one solid mass, rendering it impervious to water either from above or below. By the adoption of this system a greater degree of cleanliness will be attained, as the rain at once runs off and no mud is accumulated. Whether it will stand the heavy London traffic remains to be seen. This the roads as at present laid down do not do, but we do not think the fault rests with the grouting. A road requires at least a week's rest—in wet weather more—after being laid down before traffic should be admitted upon it. This, in London, it seldom has, and, consequently, the stones soon get loose again. When New Southwark street was paved plenty of time was given for the stones to set, and no better road, except where it may have been disturbed and botched up again by gas and water companies, can be found in all London. It is as hard as a rock and capable of standing any reasonable amount of fair wear and tear. Gas and water companies again are names full of terror to London paviors. Their pipes appear to be afflicted with chronic leakage, and the roadway is for ever being disturbed to put things right for a little while. Some relief may be looked for in the future from this evil in the subway system, which is now generally adopted in the construction of new streets, bridges, and other works. Another great hindrance to good paving is the want of a good sound bottom for the stones to rest on. The City is pretty well off in this respect, but round about it the only foundation in many places for the granite blocks to rest upon is mud alloyed with an infinitesimal amount of sand. Of course, when paving is laid down like this it will never be firm while exposed to a heavy traffic, but in this case it is not the lime grouting that should be blamed but stingy vestries and dishonest contractors.

THE SOUTH THAMES EMBANKMENT.

ON Saturday last Sir John Thwaites, attended by Mr. Bazalgette, and other chief members of the Metropolitan Board of Works, inaugurated the opening of that portion of the South Thames Embankment extending from Westminster Bridge nearly to the Lambeth Gasworks. The embankment in its form and construction differs slightly from its northern neighbour. It is built on concrete faced with granite, while that on the Middlesex side is built of brick faced with granite. There are also no recesses for the steamboat piers in connection with the South Embankment, in consequence of the shallow foreshore on that side. In both cases, however, the walls are of equal strength, and have a similar curve inward. At intervals of about 60ft are plain pedestals, to which are to be fastened massive bronze lions' heads and mooring rings, similar to those which already ornament the northern shore. The foundations of the walls are carried down to a depth of 3 ft. below Trinity high-water mark, and the foreshore is to be excavated to a depth of 18ft. At the pottery works of Messrs. Doulton, and others, entrances are to be formed to docks situate on the land side of the Embankment road. These entrances will pass under the roadway without interfering with its level, and will be as sightly as circumstances will permit. Similar openings are to be formed to give access to the river to carts and waggons now using the White Hart draw dock. The Southern Thames Embankment was not a part of the original plan, but a concession granted by Lord Palmerston to a deputation, which pointed out that the south side needed embanking more than the other, as lying much lower. The whole of the portion just opened has been completed by the Board of Works within two years.

The long-delayed opening of the railway over Mont Cenis is expected to take place shortly. An engine with a load of 25 tons made the journey to Susa on the 29th of April, and returned on the following day.

THE WORKING MEN'S COLLEGE BUILDING FUND.

AFTER a successful and self-supported existence of fourteen years, the Working Men's College in Great Ormond street is making its first appeal to the public for assistance. In the year 1857 the council purchased for £1,500 the freehold house and ground at present occupied. For some time past, however, both students and teachers have been sorely pressed for space, and a site, 1,200 square feet in area, being already provided at the back of the present house, the Council have determined on the erection of a substantial but plain building at a cost of about £3,000, comprising rooms for the art department, meeting room, adult school, museum, and class rooms. Towards the amount required the Council have in hand about £1,000, and plans, prepared by Mr. Webbe, have been accepted, and the building will be commenced at once. For the amount required to complete the work they appeal to the public, and we feel sure their appeal will not be made in vain. In fact, there is not an institution in England more deserving of public encouragement than this—the first working men's college. It was regarded in the first place purely as an experiment, and many supposed it was too good to last. It has, however, prospered better than its originator, F. D. Maurice, anticipated. The number of students at the end of the first term was 145; it is now 509. The £1,500 first expended was raised by means of a loan of £1,000 and £500 subscribed by Mr. Maurice. In all other respects the college has been self-supporting. Had Professor Maurice done no other work in the world than this, he would deserve to be everlastingly remembered by Englishmen.

INDUSTRIAL PARTNERSHIPS.

ON Wednesday evening, at a meeting of the Department of Economy and Trade (a branch of the National Association for the Promotion of Social Science), at the office of the association, in Adam-street, Adelphi, Mr. Currer Briggs read a paper "On Industrial Partnerships." Mr. Thomas Hughes, M.P., had intended to preside, but Mr. Fawcett, M.P., who in his absence was voted to the chair, explained that sudden illness prevented Mr. Hughes from attending the meeting.

Mr. Briggs commenced by observing that industrial partnership was the last and most important phase of that co-operative movement, the idea of which, twenty-four years ago, was first conceived in the shrewd brains of a few Rochdale flannel-weavers. The special object of such an association was to establish a direct intercourse between the producer and the consumer, whereby the intervention of middlemen or dealers was dispensed with. Co-operative workshops went beyond that, and were attempts on the part of labourers to dispense not only with the middleman or dealer, but also with the capitalist or employer. Such attempts, however, could prove successful only in small, and, as it were, retail businesses. The employment of capital was essential to production on a large scale. Industrial partnerships between capitalists and their workmen possessed combined elements of success which did not belong to the ordinary relations between employer and employed or to any association of mere labourers unsupported by capital from without. Those elements of success which were essential to the prosperity of any combined enterprise—viz, first, unity of authority in management, and, secondly the stimulus given to the productive energies of the labourer by granting to him a direct personal interest in the prosperity of the undertaking wherein he was engaged—were practically illustrated in the report which he was about to lay before the meeting of an undertaking with which he was connected—the Whitwood and Methley Junction Collieries. He had carried into actual practice the system of industrial partnerships in that undertaking, which dispensed nearly £1,200 weekly in wages to 1,200 men and boys. A few years ago there were constant struggles between the employers and the employed; Whitwood was a hotbed of strife and ill-feeling between them. During the ten years that he had actively participated in the management of the collieries previous to the adoption of the industrial partnership principle, there were four strikes, which lasted 78 weeks, besides innumerable miners' disputes and consequent interruption of work. Since August, 1865, when the industrial partnership principle was introduced, there had been no strike, and it had not been necessary to bring a single case of neglect before the magistrates. Peace and prosperity had succeeded perpetual strife and suffering. In November, 1864, the employers announced to their workmen that they were willing to register their company under the Act of 1862, with the primary view of securing the co-operation of all connected with the collieries, whether as managers, workpeople, or customers; that they would retain at least two-thirds of the share capital, which would be taken at the sum then standing on the books of the company as capital, that they would retain in their own hands the control and management of the collieries, and that in the distribution of the remaining third of the share capital a decided preference would be given to applications for shares, first from the officials and the operatives, and secondly from purchasers of the produce of the collieries. They also announced that whenever the profits of the collieries exceeded 10 per cent. on the capital employed, the officials, agents, and workpeople should receive one-half of the excess profit as a bonus in addition to their respective earnings. Eighty per cent. of the workpeople had taken shares in the company. Recently the company afforded a dividend of 12 per cent., and the results were so gratifying that he hoped the industrial partnership principle would be established throughout the country. He was convinced that it was the only means of putting an end to quarrels between masters and men.

In answer to a question, Mr. Briggs said the company allowed their workpeople to contribute to a union. The majority of the men, however, said there was now no necessity for making such contributions. Some years ago 600 or 700 of the workmen contributed 1s. weekly to a union, but now only twenty did so.

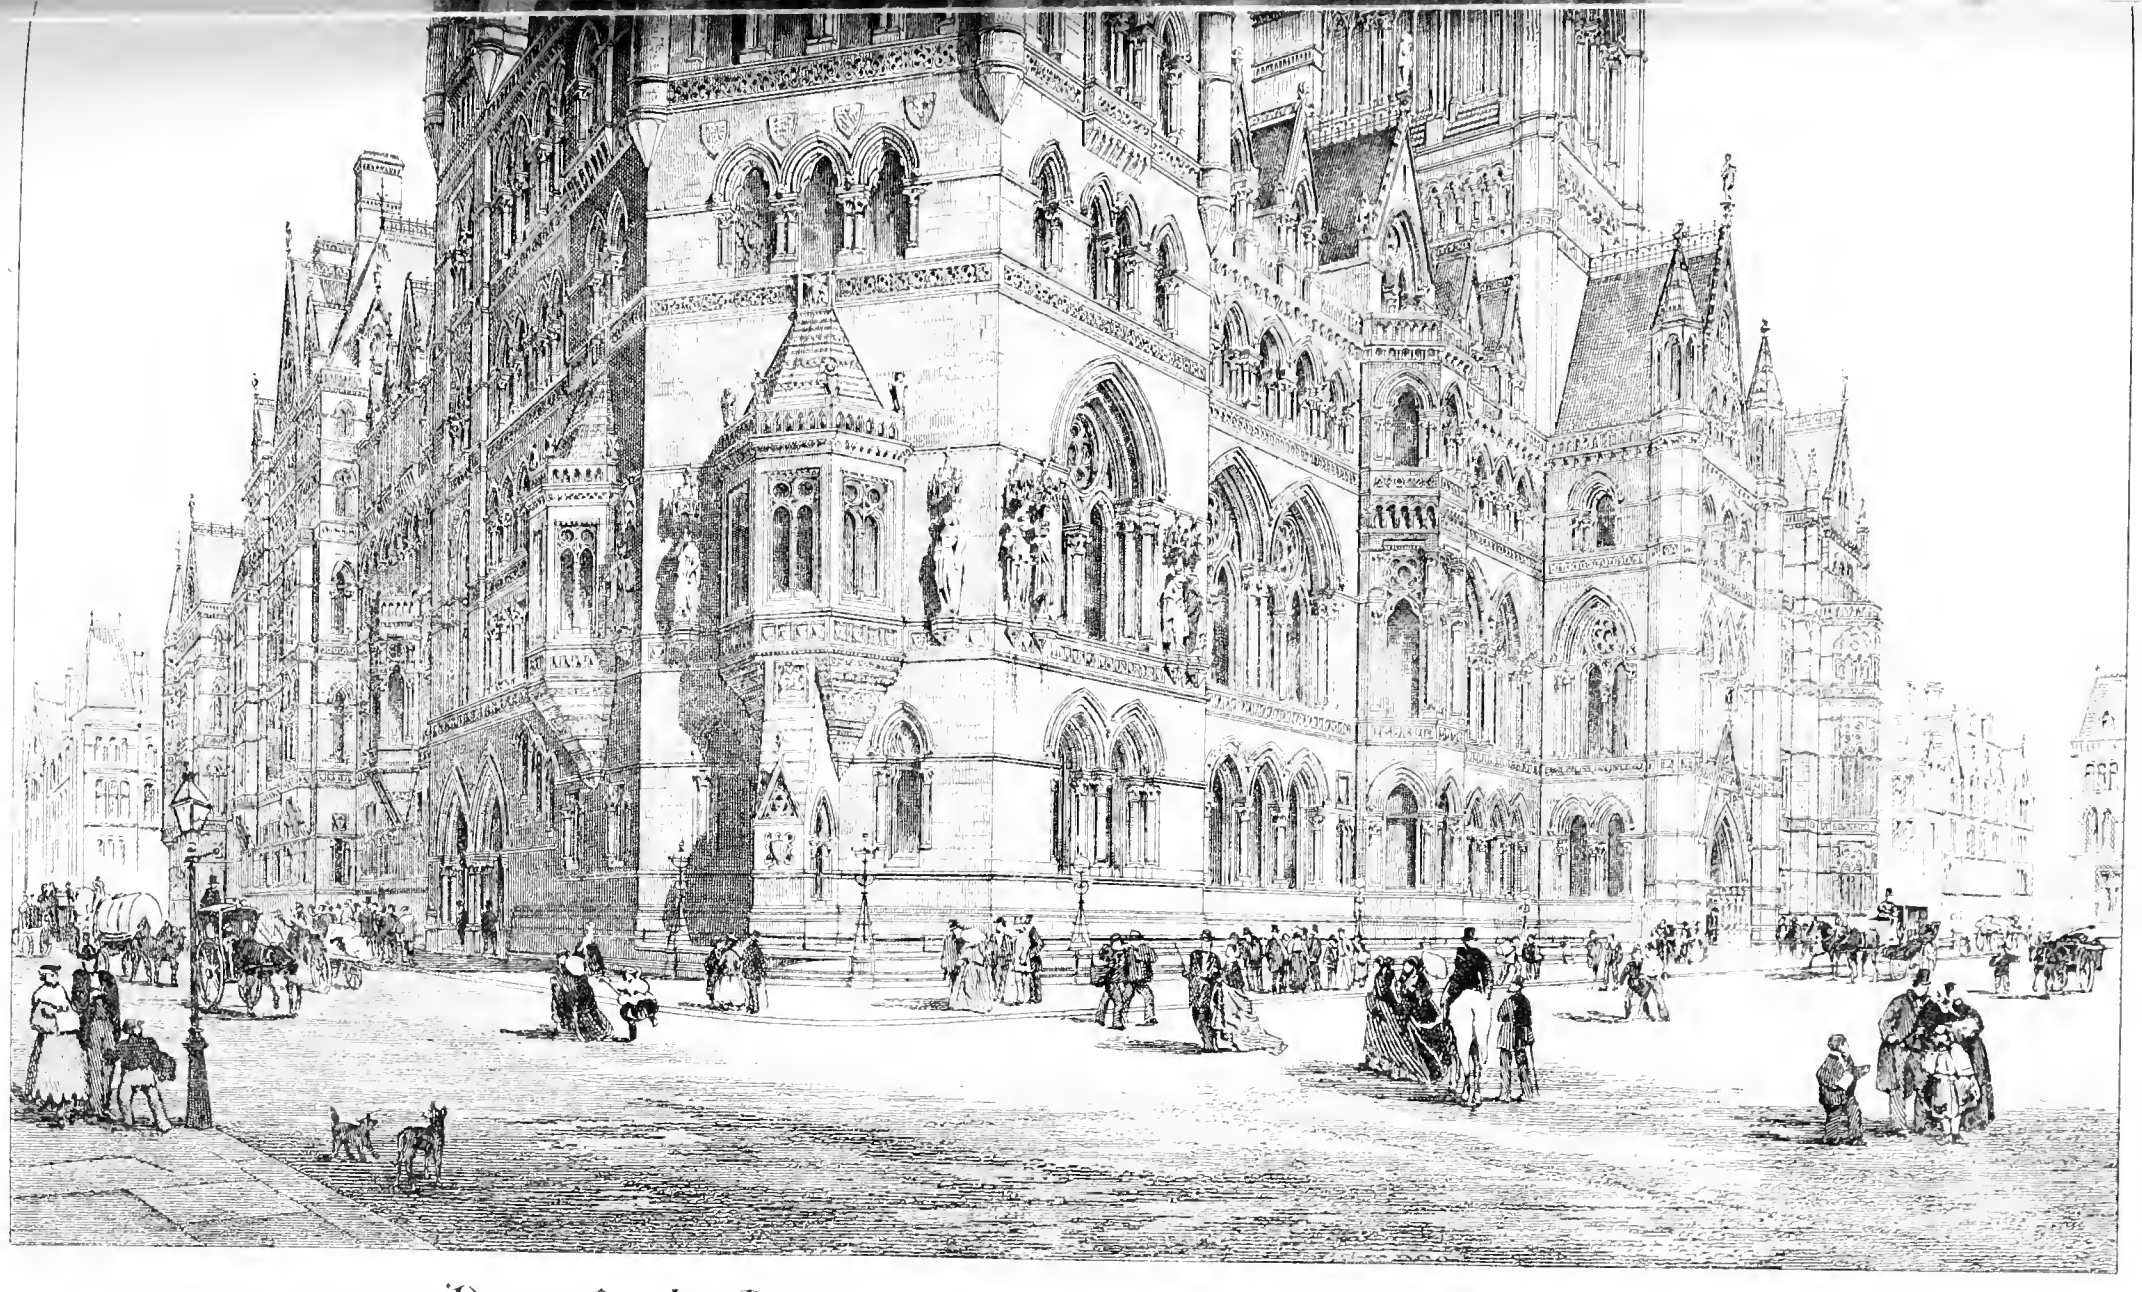
After some conversation on the subject of the paper, and a vote of thanks to Mr. Briggs, the meeting separated.

BUILDING AND LAND SOCIETIES.

THE annual meeting of the Stafford Permanent Building Society was held in the Guildhall, last week. The Mayor, W. Silvester, Esq., who is one of the trustees, presided, and expressed great satisfaction at the fact that the society during the first year of its existence had done a very large business. The balance sheet showed that the subscriptions received during the year amounted to £7,187 6s. 7d., and that advances had been made to the amount of £12,990. The report as read was adopted, the retiring directors unanimously re-elected, and a vote of thanks carried to the mayor for presiding.

The ordinary general meeting of the City of London Permanent Building Society was held on Monday evening at Radley's Hotel, New Bridge-street, at which the twenty-first annual report was presented. It showed an increase during the year of 82 members and 1,223 shares. The total receipts of the year, including a balance of £1,308 brought forward, were £68,500; the advances made to members on mortgage, £27,025; payments to depositing members in dividends and subscriptions withdrawn, £6,044; and £22,378 loans repaid. The number of members at the close of the year was 382; the number of deposit shares 2,496; and of advanced shares, 3,230, the society being debtor on the former £61,792 9s. 5d., and creditor on the latter as mortgagees £97,064 1s. 6d., of which £68,036 19s. 3d. represents cash advanced, and £29,028 2s. 5d. interest in suspense, or profit secured for division in future years. The profit for the year is reported at £4,418 7s. 10d., of which £3,193 7s. 11d. has been credited to the deposit shares, being interest at the rate of 6 per cent. per annum; £408 6s. 7d. to the reserve (which now amounts to £1,640), and the balance carried to the bonus account, and will allow a bonus of 10s. a share on the deposit shares, making the profits on such shares equal to 8 per cent. The total losses of the society during the twenty-one years have been under 3s. 6d. per cent. on the total advances of £135,631.

THE annual meeting of the Stirling School of Art took place in the Union Hall on Wednesday week. The report, which was read by the secretary, showed that the average attendance on the seventeen lectures which had been delivered during the session was 420, and the total number of members 760.



Design for the Manchester New Town Hall. Mr WATERHOUSE, ARCHT

PLAN OF NEW TOWNHALL, MANCHESTER.—ARCHITECT, MR. WATERHOUSE.

MR. WATERHOUSE'S SELECTED DESIGN FOR THE MANCHESTER NEW TOWN-HALL.

WE give this week a double-page illustration of Mr. Waterhouse's selected design for the Manchester new Townhall. Having in former articles offered observations on this and the other competitive designs, we will only now give a description of the accompanying plan, as submitted by Mr. Waterhouse:—

In addition to the accommodation specified in the instructions, there are on the second floor 17 spare rooms having an area of 1,278 yards, on third floor 36 spare rooms with an area of 2,121 yards, and on the fourth floor 12 rooms having an area of 712 yards. There are also in the roofs a number of available rooms. The schedule at the end of these remarks gives the dimensions of every room, and shows how the specified areas have been complied with or exceeded.

It has been my endeavour to make everything subordinate to a general simplicity of plan, so as to enable those frequenting the building to find the particular office desired as quickly and easily as possible.

Most of the business rooms look towards the street; the corridors and staircases, on the other hand, are lighted from the internal courts. This arrangement secures the maximum of light and air to the rooms, and admits of the corridors and staircases being everywhere well lighted and ventilated by windows, instead of their having to rely upon wells or borrowed lights.

The corridors have been placed so as to take up the least valuable space and to be as short as possible. They have a minimum width of 10ft. along the Cooper-street and Lloyd-street sides, and of 12ft. 6in. along the Albert-square front. They open out at intervals into wider spaces, convenient for consultations, and which break the monotonous effect of long corridors of uniform width. On the ground and main floors they are entirely without any change of level, and above this only occurs at the extremities of the Albert-square corridor.

A spacious porch and groined entrance hall (in the centre of Albert-square front) with porter's offices on either hand, lead into the grand staircase hall, 52ft. by 35ft. Out of this the main staircases are carried up, by double flights, one on either side, each of them 10ft. wide, to a similar hall on the main floor which gives access, on the one hand, to the public hall in the centre of the building, and on the other, to the suite of reception rooms. On the ground floor the principal hall is lighted by the staircase windows on either side.

In addition to the main entrance in Albert-square there are three other principal entrances to the building; one in the centre of the Cooper-street front, another near the corner of Albert square and Princess-street, and the third near the corner of Albert-square and Lloyd-street.

The positions of the latter two have been selected with reference to the principal streams of traffic approaching the building, to avoid the necessity, in many instances, of walking some hundreds of feet outside the building to a central entrance, only to retrace the same distance within.

Each entrance has its porter's office, double-swing doors, one within the other, and close to it one of the three principal staircases placed in the angles of the corridors, which staircases ascend to the uppermost storey in the building, and descend to the basement, thus giving direct access to the various storeys from the street.

These three principal staircases are circular on plan and average 21ft. internal diameter. In order to obviate the usual and serious objections to spiral staircases, an open well has been placed in the centre, thus making the steps at their narrow end not less than 11in. or 12in. on the tread, with a rise of 5½in. They therefore present the advantage of a rapid ascent for those to whom this is an object; while, at the same time, the offer on the outer edge an easier gradient for those for whom that is desirable.

There are, in addition to the grand staircase and the three principal business staircases, two secondary flights in the middle of the Princess-street and Lloyd-street corridors, rising up to the third floor. They are united together by a hall or corridor on each floor, thus giving easy intercommunication between the centres of the Princess-street and Lloyd-street fronts.

The private entrance for the mayor adjoins the public entrance in Princess-street, and is placed there in order that the same porter may command the two. It gives separate access not only to the mayor's private rooms, but to that portion of the Albert square corridor which runs behind and communicates with the reception rooms.

The public hall is placed in the centre of the building in order to be equally accessible from every point, and be free from street noises. It would be approached by the public from Albert square by the grand staircases through a large hall on the main floor, forming a sort of ante-room to it, and adding about one-third more available standing space on the occasion of a crowded town's meeting. This ante-room would, in the event of a rush from the hall, do very much to prevent accident, as it leads to other staircases besides that immediately adjoining. The hall is lit on either side by lofty two-light windows. The roof, though of hammer-beam construction, has a ceiling of an average height of only 42ft. (to render successful the acoustic properties of the room), while, at the same time, enough of the structural portion of the roof is left below it to destroy echo and give a varied and picturesque appearance.

In order to prevent outward thrust at so great a height from the ground, the roof is tied across as shown in the perspective view. The walls of the central hall would be of stone, the lower part panelled in oak with seats in the window recesses.

At the farther extremity of the hall are two entrances with retiring rooms attached, which communicate with the two secondary central staircases, and the Lloyd-street and Princess street corridors. Above these retiring rooms is a gallery for an organ and orchestra, or capable of seating 60 people.

It will be observed that the hall is on the same level as the reception rooms, and is so placed as to be capable of convenient use in connection with them.

The mayor's reception rooms front Albert square; the large committee room and the council chamber being placed in a line with them, so as to make one magnificent suite of entertaining rooms 300ft. in length, and occupying the whole of the principal front of the building on the main floor. These rooms are 23ft. in height.

The space over the main entrance is occupied by the ante-room, which can be approached either by the grand staircases or by the mayor's private staircase.

As it would doubtless often be desirable to use these rooms in various combinations with each other, and with the public hall, I have shown how this could be done by temporary barriers being placed across the corridors.

On one side of the dining room is a serving room and butler's pantry, with a staircase and hoist from the kitchen. From this staircase another flight, for servants, leads to the higher portion of the mayor's staircase, and so to his private rooms. A portion of this serving room might, if desired, be cut off for a waiting room in connection with the mayor's private room; but this I have not shown, as it is not specified in the instructions.

The mayor's private room is in easy communication with the town clerk's.

The cloak room is placed so as to be easily accessible either from the grand staircase or from the mayor's private staircase.

Above the serving room, in a mezzanine, are placed lavatories and other conveniences, and below it, if thought desirable, a retiring room for ladies might be introduced, as a mezzanine, approached from the mayor's private staircase.

I have found it most convenient to place the mayor's suite of apartments wholly on the second floor, looking for the most part towards Albert-square. In addition to this suite there is an extra sitting room over the mayor's business room on a rather lower level approached like the rest of these rooms by the mayor's private staircase. At the same time there would be no difficulty in approaching any of these rooms from the public corridors if required.

Below the reception rooms are placed the kitchens and servants' apartments, which it is believed are on a scale commensurate with the requirements of the rooms above. Tradespeople would approach the kitchens by the cart entrance from Lloyd street.

Adjoining the ante room on the main floor is placed the principal committee room, so as to be in immediate connection with the reception rooms, and only separated from the public hall by the Albert-square corridor. Annexed is a small serving room, with staircase and lift down to basement, so that this principal committee room might be made use of as a supper room, if required.

Beyond the committee room comes the ante room of the council chamber. The council chamber itself would be a well-lighted and noble apartment, with a retiring room on one side. It is planned so as to be approached by members either from the ante room or the retiring room, or, if needful, direct from the corridor. Above the retiring room is a gallery capable of seating 113 people, with a separate staircase from the principal Lloyd-street entrance. The other three general committee rooms are in the centre of the Lloyd-street front, with the committee clerk midway between them and the town clerk and assistant town clerk's rooms.

The town clerk's rooms, connected together by a private corridor, face Princess-street.

The assistant town clerk's rooms adjoin and are brought into close contiguity with the committee rooms by a corridor running across the centre of the building.

The clerk of prosecutions is placed immediately over the assistant town clerk, with the Princess-street staircase connecting the rooms.

The treasurer's offices look into Albert-square, and are so placed as to be contiguous to the two entrances nearest the centre of the town, so that persons receiving cheques from other departments could pass the treasurer's office on their way out of the building.

The surveyor occupies a portion of the main floor looking towards Princess-street, adjacent to the assistant town clerk. His offices have a north light and a private staircase to the room on the second floor.

The chief constable I have placed in the centre of the building under the public hall, so as to be reached with facility from all the public entrances. There is in addition a private entrance from Lloyd-street, with a bridge over the area. Another private approach to this department would be through the cartway leading into the basement, and this would give the most direct access to the cells. A private staircase connects the two floors together. In placing the chief constable's department in this as it appeared to me the most convenient position, it was necessary to separate the office for keys and to put it at some little distance from the other rooms, giving it a separate entrance from Lloyd-street.

The Lloyd-street staircase leads direct from this depart-

ment to the committee rooms on the main floor in the centre of the building. The department is still more contiguous to the committee-rooms on either side of the main entrance.

The water department is placed at the Cooper street end of the building. On the ground floor the rooms look into Princess street, and on the main floor into Lloyd street. The two floors are connected by a hook lift and by the Cooper street staircase. From the ground floor rooms, a private staircase descends to the stores in the basement.

The gas offices occupy the centre of the building, chiefly on the Lloyd street side, and would be approached with equal facility from Lloyd street and Cooper street entrances. The rooms on the ground floor and main floors are connected together by a private staircase and paper lift.

The building, sanatory and nuisance, and hackney carriage departments, are placed on the southern half of the Albert square side. Doors have been placed across the corridors, cutting off these and the scavenging departments from the rest of the building, and so admitting of the corridors adjoining the departments being used as waiting halls if desirable.

The scavenging department is on the Lloyd street side. The men when coming for pay would enter through the cart entrance to the basement, which would thus form a waiting place, instead of the street.

The work-shops for the weights and measures department are in the Lloyd street front, towards the Cooper street end, and have a recess for carts to unload. I have placed rather more of the rooms of this department in the basement than was specified, because these basement rooms would be thoroughly well lighted, conveniently connected with those on the ground floor, and approached by carts with equal facility.

The markets, and paving, and highway departments are placed on the Princess street side of the building.

The Court of Record is on the ground floor adjoining the Cooper-street entrance. The muniment rooms are in the basement. They intercommunicate and have a separate staircase.

The lamps' department, though in the basement, have a ready approach from the street by the cart entrance. The inspector is conveniently placed for supervision, and the store room has direct communication with the large internal area.

Large cellars have been provided for coal stores, in a central position accessible by the cart entrance, with lifts to the upper floors on either side. Housemaids' closets have been placed on the different floors in convenient positions.

In addition to the private water closets, lavatories, &c., connected immediately with the principal officers' rooms, I have arranged groups of retiring rooms, in close connection with all the three staircases in the basement, and on the second floor with the staircases on the Lloyd street side of the building—placed there because they would not be so much wanted on the other side.

If more of this accommodation were thought desirable one or both of the spire rooms on the second floor, looking into the eastern area might be suitably appropriated to the purpose.

The head porter's rooms are on the third floor, approached from Lloyd street by a separate entrance and staircase. His rooms are in connection with a large dining room in the centre of Lloyd street front.

Wherever there is no separate staircase to connect portions of the same department on different floors, it will be found that this connection would be amply provided for by a public staircase. In all cases the store rooms are underneath the departments to which they belong, and are readily accessible by private or public staircase.

It has been my care to make all the rooms of as good a proportion as possible, not only with regard to their dimensions on plan, but as to their height, and in all cases, the very desirable rule has been observed that no room having an area of less than 50 square yards should have a greater depth than 25ft. from the windows.

With regard to the warming of the building, I propose to place in a large sub-basement, three hot water boilers, two of them for ordinary use, the third as a reserve for use while either of the others was under repair. The smoke from the furnaces would pass through two wrought-iron smoke flues, encased in brick-work, between which and the iron flues would be an intervening space for extracting vitiated air, as hereafter described.

From these boilers hot water pipes would traverse the main corridors, in channels below the floors, everywhere on the window side. These lines of hot water pipes would form the mains from which coils of pipes, wherever wanted would be fed—as at the foot of each of the principal staircases; near the porters' offices at the general entrances; in the public hall under the seats in the window recesses; the council chamber; the public offices of the gas and water departments, the reception rooms; and in most other large rooms to supplement the fires.

Wherever possible, the coils covered with ornamental gratings, would be placed in the window recesses to correct the cooling influence of the glass, and to admit pure air from without directly behind the coil, instead of passing it through long dusty channels.

The three principal and most powerful coils would be placed at the foot of the well of the three circular staircases in the inner angles of the building, and these would be amply supplied with fresh air from the open courts. The prisoner's cells would also be warmed by hot water.

These arrangements provide for the introduction of fresh air in the summer as well as in the winter, whenever it would be undesirable to open the windows. Every room in the building would partake of these advantages by louvred and valved openings being placed above each door.

For the extraction of the vitiated air it is proposed, in the case of the public hall, to have a horizontal air shaft above the ceilings with numerous openings into it, communicating with the two vertical extraction shafts before alluded to. These shafts would be warmed by the boiler fires in the winter and by special means in the summer.

All the rooms below and about the public hall, as well as the prisoners cells, would also be ventilated into the extraction shafts.

The clock tower and the Cooper street tower would form convenient means for the extraction of vitiated air from the other portions of the building. Horizontal air flues carried behind the cornices would lead to vertical shafts in the angles of the towers, accelerating power being provided as required for summer ventilation, or whenever the reception rooms happened to be crowded. Especially would all water-closets and retiring rooms be ventilated by these means.

Over the three principal circular staircases would be louvred and valved openings, chiefly for summer ventilation. In the sub-basement there would be room for steam power, if ever required.

The whole of the building would be fire proof, constructed, where practicable, on the principle of the Dennett arch.

The internal areas would be lined with light glazed tiles, and ceramic ware would be largely introduced against the walls of the corridors, staircases, and the principal rooms.

The main entrance projects only five feet beyond the street line (12ft. beyond the "building line"), so as not to interfere with the footway, and not too much to cut up the main front.

The clock tower in the centre of the Albert square front would be 235ft. high to the gilded globe at its summit, and 158ft. to the illuminated clock dial, which is shown 15ft. wide; and as chimes would be the proper accompaniment of such a clock, a bell chamber is provided in the storey below the dial.

At the other end of the building I have shown a secondary tower, and a staircase tower in the Princess-street front, so as to give as great variety of sky-line to the building as possible.

With regard to cost, I have designed the building not to exceed the £250,000 mentioned as the sum the corporation are prepared to spend. The building contains above the ground floor, exclusive of towers and chimneys, 3,956,815 cubic feet, and below the ground floor line, 956,518 cubic feet.

APPLICATION OF SEWAGE.

THE important question of the economic application of sewage will continue to occupy public attention until it is met with something like a satisfactory solution. The question may not be attractive—it may be repulsive to many minds; and we can imagine a certain class of people turning up their noses at articles on it. It is, however, a question which must be looked at full in the face. It cannot be shirked or shelved, and no journal can be more fitted for its discussion than one devoted to the erection of substantial, beautiful, and healthful habitations for the people. We are not about to enter into the general merits of the question now, but merely wish to record the results of an experiment recently made at Paris, instituted by M. Dumas.

In carrying out this plan the sewage is collected in reservoirs, and precipitated with a solution of sulphate of alumina. The quantity is not stated, but the cost of the precipitant is said to be one centime to the cubic metre of sewage—that is, less than half a farthing a cubic yard. The precipitate is quickly deposited, and contains all the phosphoric acid, and nine-tenths of nitrogen, and organic matters in the original sewage, and it is therefore a valuable manure. The weight of dry precipitate obtained is six kilogrammes (7lb.) per cubic metre. The supernatant liquor is limpid and completely deodorised, and may be run into a stream without any fear of disagreeable consequences. It is only right to say that the use of sulphate of alumina has been suggested in this country, but with addition of lime and sulphuric acid, which have greatly lessened the value of the precipitate for agricultural purposes. There are many towns in England where this precipitation by sulphate of alumina alone might perhaps be carried on with profit.

Another suggestion, says the *Mechanics' Magazine*, much less reasonable has been made for the extraction of ammonia from town sewage. The inventor of this process adds phosphoric acid and magnesia to the sewage, with the idea of precipitating the ammonia in the form of ammonia-magnesian phosphate. The precipitate he gets, he collects and dries, and then distils with quicklime in gas retorts, condensing the ammonia, which passes over in the usual way. The residue in the retort will contain the phosphoric acid, and be applicable for manure. As a method of obtaining ammonia, this process is not worth a thought. But while writing on sewage, we may remark that a similar precipitation formed the subject of a patent by Mr. Blyth, the chemist to the Board of Health, which never, we think, attracted the attention it deserved. The patent has long expired, and the information contained in it is fully at the service of the public. The sewage being conducted into reservoirs, a calculated proportion of superphosphate of lime was added, and the mixture strongly agitated. Lime water was then added in sufficient quantity to render the whole rather alkaline. The mixture was again strongly agitated, and then allowed to deposit. A precipitate was thus obtained rich in ammonia, and all the suspended matters were carried down by it to the bottom of the reservoir. This we believe to be a valuable process, but it requires intelligent superintendence.

Mr. John Mellor, an antiquary of Derby, states that he has discovered the remains of King Alfred at Hyde Abbey, Winchester.

WATER SUPPLY AND SANITARY MATTERS.

A MEETING of landowners and occupiers of Cheltenham at a recent public meeting adopted the following resolution to the Local Board of that town: "That should the Local Board determine to abate nuisance by the irrigation scheme, we, the undersigned, are willing to take the flow of sewage over the number of acres attached to our names, for such times, and on the payment of such reasonable sums to the Local Board as may be agreed upon." (Here follow the names of twenty-nine owners and occupiers of some 2,000 acres of land, all of whom are willing to take the sewage on their land.) Mr. Bateman, C.E., who has reported on the state of the sewage to the Commissioners, has advised them to discontinue the present treatment of the sewage by deodorisation, in favour of the system of irrigation. It is well known that the cost of the deodorising agents is some £800 or £1,000 per annum, and yet the present plan is so ineffectual that the authorities are in constant dread of being dragged into Chancery at the suit of adjoining landowners.

In a very careful paper on the statistics of the recent epidemic of typhus in Aberdeen, Dr. Beveridge, of the Royal Infirmary, traces its origin to overcrowding and sanitary neglect of the dwellings of the lower classes. The number of deaths was 610, occurring apparently in 4,631 cases. Estimating the loss of labour of each adult at 10s. a week, and the loss of life according to the value of labour over the estimated working life of the persons who perished in this epidemic, he calculates the probable cost of the epidemic at £55,000.

The Royal Commission on the pollution of rivers have inspected the farms of the Metropolis Sewage Company, near Barking; and, among other things, they witnessed the cutting of the second crop of rye grass this season, weighing nine tons to the acre, and representing the growth since the 12th of March. Dr. Frankland, the representative of chemistry in the commission, took several samples of sewage, both before it went on the land and after it came off, for analysis.

Building Intelligence.

CHURCHES AND CHAPELS.

The foundation stone of a new Congregational Chapel was laid at Blyth, near Newcastle, on Thursday week. The proposed style is Gothic, and the building will consist of nave and two transepts with galleries around the entire building accommodating 420 persons. The works will be carried out under the superintendence of Messrs. Darling and Wood, architects, of Newcastle, the contractor being Mr. James Nairn, of Blyth.

A new Roman Catholic Church is being built at Glenealy, County Wicklow. The church is designed with transepts opening to nave, with double arches; the west front is surmounted by a belfry, and a gablet furnishes the east end, dying into apsidal roof. The architects are Messrs. Pugin and Ashlin, of Dublin.

The church of St. Matthias, lately erected on the newly formed district of Ballyeglish, in the diocese of Armagh, has been consecrated by the Lord Primate of Ireland. The style is First Pointed, and the church is built of white limestone relieved with bands of red stone. It consists of nave and apsidal chancel with a south porch. Sittings are provided for 200 persons. The works have been carried out by Mr. G. Tipping, of Castledawsen, from the designs of the architect to the Ecclesiastical Commissioners.

The ancient parish church of Darenth, Kent, was reopened on Thursday week, after careful restoration, under the supervision of Mr. W. Burges. The nave has been reseated and paved with glazed tiles. In the chancel carved oak benches have been erected for the use of the clergy and choir; and a neat lectern placed on the south side. The font, which is large and apparently very ancient, is perhaps the most curious object in the church. The building, which is supposed to have been begun about A.D. 900, is a mixture of Norman and Gothic architecture, and contains a nave south aisle, and chancel, accommodating about 200 persons. The worshippers in the aisle obtain a view of the chancel through an opening pierced in the corner of the wall adjoining one of the pillars supporting the chancel arch.

A new church is to be erected at Brighouse, Yorkshire. Plans have been prepared by Messrs. Mallinson and Barbe, architects, of Leeds. The style is Geometric Decorated Gothic, and the edifice is intended to seat 500 people. Internally it will be divided into nave, 69ft. long by 22ft. wide, and two side aisles, each 10ft. wide, and chancel 28ft. long by 18ft. wide. On the south side of the chancel will be an organ chamber and vestry. There will be no tower or steeple, but a turret for two bells at the west gable, which will be crocketted, and from which will rise a pinnacle finished with a stone cross. The cost will be about £4,000.

The ancient parish church of Eccleshall has been restored, and was reopened a few days ago. It belongs to the early and the late English periods, chiefly to the former. The restoration was entrusted to Mr. Street, A.R.A., and the work was done by Mr. Cobb, builder, of Newport, who commenced it in September, 1866. The total cost of the work is between £7,000 and £8,000.

BUILDINGS.

The new freight depôt of the Hudson River Railway in New York, will be, it is stated, by far the largest building ever erected in that part of the world. It will have an area of 178,327½ square feet, or over four acres under one roof. It is to have three storeys and a basement, will be about 60ft. high, and will be built wholly of brick, iron, and stone, so as to be absolutely fireproof.

The city gaol of Limerick has recently undergone extensive alterations and improvements, at a cost of £5,300. The works have been carried out by Mr. M. Clayton, builder, of Limerick, from the designs of the city architect, Mr. W. E. Corbett.

A design for new schools for Gaddesby, Leicestershire, by Mr. R. W. Johnson, of Melton and Leicester, has been selected in a limited competition, and the works will be proceeded with immediately. The building, which is Gothic in character, will be of dressed red brickwork, with Bath stone dressings. The roofs will be covered with Staffordshire ornamental tiles.

The first stone of the New Temperance Hall and Public Institute, Finedon, North Hampshire, was laid on Monday last with the usual ceremony. The building, which is in the Gothic style, will be built of Finedon brown stone, with dressings of Box stone, and will contain on ground floor large club-room, reading room, ante-room, kitchen, &c, and a dwelling for the hall-keeper. The upper room, which covers the whole, will be spacious and lofty, with an open timbered roof. The site chosen is a good one, being on a plot of ground known as "The Green," having roads running all round, and being slightly elevated. Mr. R. W. Johnson, of Melton and Leicester, is the architect, and the contract for the erection of the building has been taken by Mr. W. Henson, builder, of Finedon.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—I. E. G.—E. W. Y.—D. O. B.—A. D. S.—E. P.—G. T. R.—W. L. B.—O. N. S.—E. W.—B. Son and B.—H. I. J.—I. and E. G.—T. C. and Sons—W. C.—L. and Co.—A. A. R. and Co.—G. H. G.—G. N.—P. and S.—W. H. B.—I. T. C.—Col. S.

Correspondence.

THE EARTH SYSTEM FOR VILLAGES.

To the Editor of the BUILDING NEWS.

SIR,—The question of the disposal of sewage has become of such vital importance that it ought to have the earnest attention of everyone. In an article in the last "Quarterly Review," entitled the "Use of Refuse," the following paragraph occurs:—"The value of this sewage (speaking of the sewage of London) Professor Way has estimated at two millions per annum, and whilst we were absolutely throwing this away, we were ransacking the islands of the Pacific for guano, a refuse that had lain there for ages untouched by the hand of man. A more flagrant example of wilful waste on our part could not well be quoted, inasmuch as guano, though obtained at a very high cost, is not so valuable as that we had ready at hand when in a concentrated form." Now, Sir, is it right that man should, day after day, and year after year, take his nourishment from the earth, but never return a fraction of it back. It surely could not have been intended by the Maker of the Universe that there should be this waste, but ever a reproduction. The question is, how is man to nourish the earth in return for the nourishment he takes from it. In the case of isolated houses and small towns and villages, the earth system seems to me to be the best method of solving the difficulty, as it is the only one that can do this in "a concentrated form." I think that excrementitious matter should be treated distinctly and separately from the slops or washings of houses. No slaughter house refuse—in fact, no solids whatever, ought to be permitted to pass into the drains. All the pluvial waters also ought to be treated by themselves, and for this reason, that you reduce the amount of liquid to be dealt with to a minimum and constant quantity. Many objections have been raised against the earth system, on account of the quantity of earth required. Now this quantity is not so very large after all, and persons seem to forget that it is only borrowed, and will all be returned again in the shape of human guano. The quantity of earth required is four cubic feet for each person per annum when the earth is used four times, which can easily be done, for in five weeks the whole of the excreta and paper entirely disappear, not a vestige of either remains, and this earth, if dried by a moderate heat, can be used over and over again up to twelve or even twenty times, and then is of far greater strength than any guano that was ever imported.

In treating small towns by this system, there can be no doubt that it must not be left to each individual householder to find his own earth, but a company must be formed, whose duty it shall be to supply and take away the earth, just as a water company supply water, and I am quite certain that it would prove most remunerative. With regard to villages, the system ought to be taken up by the large landed proprietors, just as it is at Halton, and they would soon find that they would be amply repaid for the outlay; or a company might be formed to supply a certain district of so many miles radius. In most villages slops could be dealt with within the immediate precincts of the houses, but in small towns, where this can't be done, then a small system of pipe drainage must be carried out, and the slops dealt with either by sub or surface irrigation, or in precipitating tanks and filtration, and if the slops are kept to a minimum quantity, I do not see much difficulty. Of course the great difficulty is prejudice, and the unwillingness of owners of property to go to the expense of converting the privies into earth-closets. The great objection to the water system for small towns and villages is the cost, and it reduces the value of human excrement to a minimum, whereas earth raises it to the maximum. In the one case you can only grow Italian rye grass, and in the other case any crop whatever. One might enlarge upon this subject to a great extent, but I know your space is valuable.—I am, &c., REFORMER.

MODERN ART.

SIR,—The Greeks attained a very high degree of culture. The lowest classes of citizens attained even a considerable amount. The mythology to them was household knowledge, universally known. They comprehended the very conventional treatment of the legends in sculpture. They were interested in the tragedies of Æschylus. Considering the population of their towns, the attendance at these plays was astounding. We have no culture like it in the world since. Since the beginning of this century there has been a complete national movement for culture in Germany. Education has been extended to all classes. Modern culture can go no further than it has in Germany. Every class is educated to the utmost, considering the age at which different classes are obliged to withdraw their children from school. Of course the boy who can go through his university course attains more than the boy who is obliged to leave the Burger schule at fourteen. The great school of poetry, of which Goethe is the head, is a poetry arising out of the very high culture of the highest educated classes. The painting of Cornelius appeals to such a class only; but both this painting and literature must be said to be above the masses. Art has, even with the universal high culture, remained above the masses. Now the question to be asked is this—admitted the highest amount of culture attainable in modern times to the middle and lower classes—what form of art and poetry will that class be interested in? What subjects will interest them? Will art for the future be of two kinds—one for high culture, one for lower? Do the masses prefer art or physical science in the present day? which does the intelligent artisan like best? In ages when art was a tradition and universal, were the masses interested in it as art? In the painted cathedrals was their interest in the art, or in the history of the paintings taught? We shall not probably attain in this country the general culture of Germany, not even in fifty years. There is no very earnest desire for culture; therefore, what is the course of art to be? In considering these questions read M. Arnold's report on foreign education (Macmillan), Heines' "Reisebilder," Lewes' "Goethe," and "the Life of Humboldt" These will essentially give the tone of modern German culture. It is probably in music that culture has extended its influence furthest in modern times in Germany. Compare the number of Liedertafel in Vienna with vocal societies in London. Compare the populations of the two towns. Such choirs as the Cologne and Berlin are unknown in England. We have in London how many performances in a year of serious instrumental works, and how many are there in Dresden? Compare the populations. These are merely suggestive thoughts as to what modern times, with their particular turn for commerce and exact sciences, will and can produce. What this phase of the world's civilisation, this period, has to do. What is its object? To what extent does art enter into its pleasures?—I am, &c., A. B. C.

Intercommunication.

QUESTIONS.

[846.]—COLOURING PLASTER.—I should be favoured if any of your correspondents would let me know the best means for size colouring new plaster without showing the colour stained or having the appearance of damp.—E. J. H.

[847.]—WROUGHT-IRON PLATE GIRDER.—I am getting out a wrought iron plate girder, 5ft. 3in. deep and want to have the plates in as long lengths as they can be rolled, so as to avoid having a great number of joints. Will you kindly tell me what is the greatest weight iron manufacturers, such as M'Naught, Robertson, and Co., will roll plates without charging an extra price for. Ten years ago 3 cwt. used to be the greatest weight; but this must have long been altered, on account of improved machinery used in the rolling mills. No doubt some gentleman correspondent can give this information, which would be very valuable to—PLATE GIRDER.

[848.]—THEODOLITE.—Will any of your readers kindly inform me of the best work to be obtained on the use of the theodolite for a beginner?—E. M. S.

[849.] IRON AND WOOD GIRDERS.—Is there any work out on cast and wrought iron and wood girders, giving a scale of dimensions for resisting compressible and tensile forces? If so, I should be glad if any of your readers would inform me of the same through these columns. —A BEGINNER.

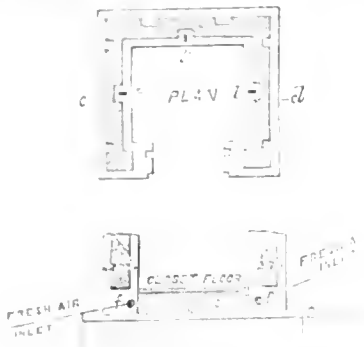
[850.]—SELF-ACTING ASH CLOSET.—Will you please to inform me, through the medium of your valuable "Intercommunication," where I could obtain a self-acting portable ash closet?—J. CLARKSON, 6, Dryden-street, Manchester.

[851.]—TAKING OUT QUANTITIES.—Can you, or any of your readers inform me where I may get a work on the "Taking out of Quantities in Buildings?" I should also like the price to be mentioned.—A. J. L.

REPLIES.

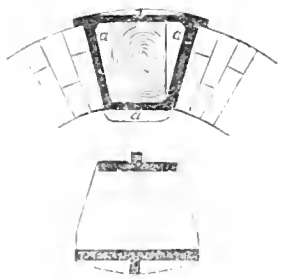
[818.]—A DAMP SAFE.—(STRONG ROOMS.)—As so much has been said during the last two weeks in the BUILDING NEWS about Damp Safes, I beg to suggest that to ensure a dry room would be to construct the foundations and superstructure as per sketch. First, 12in. below floor level, flag over the room and under walls with 2½in. York flagging, well bedded and pointed in cement. Second, the substance of walls should be 2ft. 7in. out to out, built with 9in. brick walls, and inverted pilasters to strengthen them *f f*; *t t t* are small flues for fresh air to pass through; to fix hit and miss gratings 6in. above floor of closet *t t t* and to pass up to ceiling of strong room, and from thence escape through a 4in. stoneware pipe to eave of main building. The space between wall of strong room, and also from the flagged course to floor line of closet to be filled with smith's ashes, passed through an inch-mesh sieve

and well rammed as the work is being built up. The closet floor should be laid with tiles in cement. This plan would not cost more than those usually built with solid



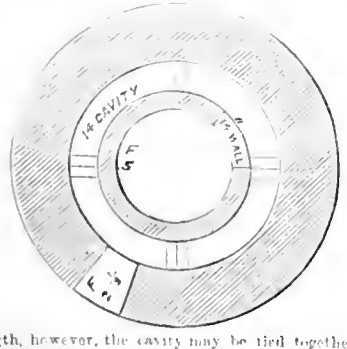
walls, and, for a certainty, would always be a dry, strong, and ventilated room, which I would recommend to "Banker" and other gentlemen similarly situated. "G. M.'s" plan would not do, wherever slate is employed every change of atmosphere would produce condensed moisture; and, as to Mr. Burfurt drying the closet with gas, no doubt it has had a temporary effect, but wait till frosty air returns.—FRANCIS HANSOM LEEDS.

[820.]—SUPPORTING A BEAM.—Perhaps I ought to have been more descriptive in my reply to the above, as it is evident "F. H. L." has mistaken my meaning. What I proposed was to make the strap a key by giving it a proper form, making the sides radiate in a line drawn from the centre of the arch. Of course, I understood the strap to have a top as well as bottom. My second diagram (sketched with a pen, as at the time I had not instruments at hand) was intended to show that it should be a complete cell. I certainly should never have dreamed of either removing the key or substituting wood, though I have heard of a man, and know him too, who set his ladder against a beam and then went up to knock away the fastenings, and was very much astonished when all came down together. With regard to the material, I interfered as little as possible with what was proposed in the query. If wrought iron was used, it should be of sufficient thickness and strength to bear the crushing strain without collapsing, and special care must be taken to weld it thoroughly. The effect of the beam on it is a tensile strain downwards. I annex two sections for a key of cast metal—one through the line



of arch, and one taken transversely; the parts marked *a* to be central webs. The bottom of key may be made broader, that the thickness of arch and the sides bear by cut in a slope to it. Or, thus giving additional support to the part carrying the beam. The sides might be projected downwards, to look the bottom, if necessary, as shown by the dotted line, to rest the web underneath. There are many cases where a saddle such as your correspondent recommends might be preferable. We can conceive of cases, however, where it might be requisite to thus carry a beam in the centre of its length, or at some distance from the end, the entire length being no doubt used as a binder or tie. Such a shoe as "F. H. L." proposes could be imbued with a metal key in one casting to carry the end of a beam, but I would suggest that, instead of forming the shoe with a central web, it have one at each side, and so avoid wounding the beam.—G. M., Norton.

[832.]—BUILDING CHIMNEYS.—The best method of building a chimney is to carry the flue one uniform width all the way up. The flue ought to be left inside and a 9in. wall, with a cavity of 1in. to prevent the heat from injuring and cracking the outer course. For the sake of



strength, however, the cavity may be tied together with four brick piers carried up twenty yards; still the outside will taper with the cavity. There is no utility, in so far the draught is concerned, in contracting the flue at the top. The area of the flue at the top ought to be equal to the flues connected with the chimney, so that the smoke may have a free passage through.—J. W. O., Oldham.

[824.]—DRAWING SCHOOL.—The Working Men's College, Great Ormond street, is the best drawing school near King's Cross, and is very reasonable in its charges. I should like to warn your correspondent against a noted advertising architectural farm in the neighbourhood.—F. R.

[825.]—GAS-MAKING. There is a small apparatus made by Porter and Co., of John street, Adelphi, which would most probably suit your correspondent's wishes.—X. P.

[826.]—RESPONSIBILITY OF AN ARCHITECT.—Your correspondent first asks whether he is responsible as the architect to a building if the construction fails, he having been employed to superintend, although only verbally, and not being employed to write a specification. It would appear from the form of his question that he would only take the position of a foreman to his employer, and in that case would only take the position of an agent; but this would depend upon whether the payment for his services was in the form of a percentage or as wages for the time employed, because clearly he was employed to superintend; and if he passed bad material in workmanship, he, as an architect, is liable; and it must be very clearly proved that the building failed from those causes, and not from the construction shown on the plans, before he can be acquitted of all liability.—F. R.

[842.]—DRAIN TRAPS.—The direct answer to the question "Whether there is manufactured and sold a better form of trap for kitchen sinks than the ordinary brass bell trap?" I must leave some one else to give; but as I entirely approve of the condemnation of bell traps, I wish to add my testimony to that of Mr. Kirkby of the inefficiency of that form of trap. My experience confirms every word that Mr. Kirkby says about bell traps; and I, for my part, prohibit their use where I have any authority. But I think there ought not to be a trap of any kind in the sink itself, or in any part of the kitchen. I think all drains ought to terminate outside the wall, in the open air, and that a trap, either D trap or gully trap, should be placed right opposite to the kitchen sink, and close to the wall, to receive the waste water from the sink through an open pipe. The end of this pipe at the sink may have a plug to prevent any current of air, if that be desired; but in general no inconvenience will be experienced by leaving it open. I have found a few cases where the position of the sink did not admit of this, but in the great majority of cases it does, and in some I have altered the position of the sink to make it practicable. I believe that no form of trap will prevent the eruption of gases from the drains when they are flushed with water, either by natural rainfall or artificial means; and, therefore, unless a special ventilating pipe be carried up at the head of every house drain, up which the gases can find an easy escape at such times, the gases will be driven through any trap, however well constructed; and to suffer these gases to be driven into a kitchen, or anywhere else inside a house, is to induce a poisonous state of the atmosphere.—A TOWN SURVEYOR.

[843.]—DENNETT'S FIREPROOF CONSTRUCTION.—In answer to "Inquirer," in last week's BUILDING NEWS, it will perhaps be sufficient to tell him that the principle of the construction consists of cast-iron girders at stated distances, from the bottom flange of which spring flat brick arches, and the top is made flush with concrete filling between the crown and the haunches. For any other information he can refer to the patentees, who advertise regularly in this paper.

[845.]—ROYAL ACADEMY.—There is no expense in becoming a student; the instruction is gratis. The first step for a student to take is to ascertain when probationer's drawings are to be sent in, which can be ascertained from one of the porters. A design of some kind must be sent in, and if approved of the student is admitted as a probationer. He is then required to draw out a design from a given subject on the walls of the Academy, and if this is also approved he is admitted, and after having attended a course of the lectures on geometry, perspective, anatomy, painting, and sculpture, he is eligible to compete for any of the prizes, and can study from the antique models for seven years.—F. R.

WAGES MOVEMENT.

The threatened strike of the masons at Keighley has been averted by the yielding of the masters, accompanied by a slight concession on the part of the men. The men consent that in future the stone may be worked at the quarries, and sent from thence ready for the wall. They bind the master not to take more than one apprentice to seven journeymen, and in no case to have more than three apprentices at one time—an exception being made in the case of masons' sons. And they demand that when sent more than a mile from home to labour, the time shall count from their leaving the yard.

All questions as to wages in the carpenters', plasterers', and bricklayers' trades in Wolverhampton are settled by arbitration under Mr. Rupert Kettle's plan, with that gentleman for umpire. A series of meetings lately held had suggested the desirability of a general conference of the masters and operatives of all the building trades in the town. The conference was therefore convened, and was held yesterday week in the council chamber of the Townhall. After an amicable discussion the following resolution was agreed to:—"At a general conference of the three branches of the building trades who have accepted arbitration as the means of settling the rate of wages and the trade rules for the town of Wolverhampton, held at the Council Chamber of the Townhall, on the 30th of April, 1868, it was unanimously resolved that, upon condition that the masters now give wages at the rate of 6d. per hour, with the Saturday half holiday (that is, to cease work at one o'clock), then that no alteration whatever be claimed, either in the rate of wages or in the rules for the next three years—that is, until May, 1871. That, except as to the rate of wages per hour, and the half holiday in the trades who have not half holiday already, the rules stand the same in all things as those now in force." This resolution was signed by six masters, six plasterers, six carpenters, and six bricklayers. On the suggestion of Mr. Kettle, it was spontaneously determined that there should be an annual celebration of the successful manner in which masters and men in these three branches arranged questions which had hitherto to be decided by the arbitrament of a strike or a lock-out—the day to be observed as a holiday, and the proceedings to begin with a service at the Old Church, followed by a *soiree*, or some similar entertainment, in which masters and men could unite.

A serious strike has taken place at Liverpool. The new code of regulations adopted by the Liverpool Master Builders' Association was announced to come into effect on Monday. The result was that a number of the men struck work, and a deputation was arranged to meet the masters on Tuesday. The masters met the deputation, and a proposition was made by them to submit the matter to arbitration, the men in the meantime to work under the new rules. This the men refuse; a general strike has taken place, and a number of important public works are brought to a standstill.

The bricklayers and labourers of Walsall have struck work, to enforce upon the masters their trade rules, and an advance of wages. Trade is very slack, and a revival is not likely to be encouraged by the strike.

The stonemasons' strike at Birmingham, which commenced on Friday last, still continues. The chief points which the men seek to enforce are those relating to the introduction of worked stone and piecework. These are embodied in the two following rules:—"No worked stone to be allowed to come into Birmingham, with the exception of tooled York flags, common tooled steps, and the like." "That no master mason or master builder sublet any mason work, and no mason to work by the piece, or subcontract with any master mason or master builder, unless he finds his own materials. Ornamental carving and turning balusters, small columns, and the like, may be done by contract, but the roughing out, and all the other cutting about the same, not being carving or turning, and the fixing of the same, to be done by day-work."

STAINED GLASS.

A handsome chancel window has just been erected in St. David's Church, Birmingham. In the centre of the window is placed David, King of Israel; on his right are Moses and Aaron, and on his left Elijah and John the Baptist, representatives of the Law and Prophecy. This window was executed by Mr. T. W. Canom, of Smethwich.

A memorial window to the late Earl of Craven has been erected in the church of St. Michael and All Angels, Coventry. The window contains seven lights, and the subjects illustrated are incidents in the life of David. It was executed by Messrs. Heaton, Butler, and Bayne.

STATUES, MEMORIALS, ETC.

The bronze statue of the late Sir Robert Peel, which has recently been removed from the original site chosen, is now placed on a granite pedestal at the public entrance to the Houses of Parliament, opposite Parliament-street and Great George street. The statue was uncovered on Monday without any ceremony.

A monument to the memory of Luther, at Worms, is to be inaugurated on Thursday, June 25. The fêtes will last three days—the 24th, 25th, and 26th.

It is stated by the *Owl* that a plaster cast of Baron Marochetti's statue for the Albert Memorial in Hyde Park, was lately put into its position in order to judge of the effect it would produce. The result was so unsatisfactory that the statue has been condemned as unworthy of the shrine prepared to receive it.

LEGAL INTELLIGENCE.

CLAIM FOR ERECTING A MONUMENT.—Daniel *v.* Chaplin. This was an action at Nisi Prius to recover £100 for the erection of a tomb or monument in Christ Church Cemetery at Forest Hill. The defendant had ordered the plaintiff to erect the tomb at the agreed price of £100 and it was to be built of Dove and Sicilian marble. It was contended for the defence that the marble was of inferior quality and the workmanship bad. Witnesses having been examined on both sides, the jury found a verdict for the plaintiff for the amount claimed.

PARTY WALLS.—At the Marylebone Police Court on Friday last, Mr. Benjamin Taylor answered a summons taken out against him by Mr. Henry Baker, district surveyor of St. Pancras, for that "he, the said Benjamin Taylor having recently erected the 'Lichfield Ale Stores', Frederick-street, Hampstead-road, which was hitherto in but one occupation (viz., that of himself), did divide the same into two or more separate tenements, each having a separate entrance and staircase, or a separate entrance from without," contrary to the 27th section of the Metropolitan Building Act. Mr. Baker prosecuted in person. Mr. Taylor was represented by Mr. Yarde, solicitor, assisted by Mr. W. F. Potter, architect. Mr. Yarde said this was a case never contemplated by the Act of Parliament, which intended that no building should be divided into separate buildings, except by proper party walls. This case more properly came under the second clause of the 27th section, as to the separation of a building into "sets of chambers or rooms tenanted by different persons," and, as the building did not exceed 3,600 square feet in area

the act had not been infringed. Moreover the building had never been in one occupation as contemplated by the act, in the third clause of the 27th section, but had always been in the joint occupation of Messrs. Taylor and Parish, and Arnott, as offices or chambers. Mr. D'Eyncourt, after a lengthened hearing, dismissed the case.

Our Office Table.

A new public park, 30 acres in extent, was on Friday last formally opened by Mr. Peter Wood, the mayor of Southport, amidst the general rejoicings of the inhabitants and visitors.

It is stated that the ground hitherto in possession of the Strand Hotel Company is to become the site of a new metropolitan theatre. A gentleman who has built one metropolitan and one suburban theatre since 1864 has become the purchaser of the property, and in a few days the work of re-construction will commence. It is not proposed to make the new theatre as large as the New Queen's even if the space will permit, but to build a house larger than the Olympic, but not so large as the Lyceum.

On Friday last a crowded meeting of operatives connected with the various branches of the building trades was held at the Cabinet Theatre, Liverpool-street, King's Cross, Mr. W. Morrison, M.P., in the chair, in furtherance of the co-operative movement in the building trade. The chairman entered at some length into the principles of co-operation as applied to production, and expressed the pleasure he felt at finding the building operatives now about giving practical effect to these principles. Mr. Alfred Walton, architect, then addressed the meeting, giving some practical advice as to the working of the proposed company. He was pleased to hear that already about 2,000 shares had been taken in the company by building operatives. Mr. George Potter pointed out the advantages and benefits of co-operation. It was a most effective weapon with which to meet strikes and lock-outs. He believed the present movement had in it all the elements of success. Resolutions in accordance with the object of the meeting were adopted.

The fortnightly meeting of the Liverpool Architectural Society was held on Wednesday evening, Mr. T. J. Kilpin, president, in the chair. The competition designs for a village church, sent in by the students, were exhibited, and the President, in announcing the award of the council, congratulated the society on the great talent, industry, invention, taste, and architectoral knowledge which all the drawings evinced in a very considerable degree. The first prize, he said, had been awarded to the design whose motto was *L'ouvrage du Soir*, and the second prize to the design marked *In loco*; and he had great pleasure in expressing to the students the thanks of the council for their exertions. The paper of the evening, on "Fashion in Architecture," was read by Mr. Herner, and was followed by a brief discussion.

Baron Haussmann is proposing, by a system of sluices, to raise the depth of the Seine at Paris to an extent which will enable vessels of considerable tonnage to ascend to the metropolis.

The Dean and Chapter of Durham have had forwarded to them, through a lady, the ring of the venerable Bede, which was extracted from the tomb in the Galilee when it was opened many years ago. The ring will be placed among other relics in the Dean and Chapter Library.

A popular meeting of the Edinburgh Architectural Association was held on Wednesday week, when there was exhibited, by means of the lime light, a large collection of photographic views illustrative of ecclesiastical architecture, principally Gothic. The chair was occupied by Mr. John C. Hay, president of the Association. The views were described by Mr. Hippolyte J. Blanc.

Mr. Carmichael, the painter, died very suddenly at his residence at Scarborough on Saturday morning last. He was sixty-eight years of age.

A statement has appeared in some of the papers to the effect that the Government had resolved to purchase a portion of Hayling Island, to which we drew particular attention a few months back. The statement, however, is premature.

The well-known ceramic manufacturer, Richard, of St. Christopher, near Milan, has made known his process for varnishing the pottery exhibited by him at the Paris Exhibition. The following are the ingredients and their proportions to be fritted: Carbonate of soda 1·000, boracic acid from Tuscany 0·800, kaolin 0·125, carbonate of lime 0·250, sulphate of lime 0·250, crystalled feldspar 0·750, quartz from the Tessin 0·280, fluorspar 0·150. Piedmont oxide of manganese is added to obtain the desired tint. The whole frit is ground fine, and then mixed with 110 parts of kaolin, and 52 parts of feldspar for every 460 parts of the above frit. It is applied as usual in glazing, but as the specific gravity is less than that of the leaden coating, the same weight of the new glaze will cover a greater quantity of pieces.

The cupola of the church of the Holy Sepulchre is very nearly finished. Three months hence it will be completely done; nothing is wanting but the sheets of lead which will cover it. The Princess de la Tour d'Auvergne has made a donation to France of the spot on the Mount of Olives where, according to a Latin tradition, our Lord taught the "Paternoster" to His disciples. An iradé of the Sultan has confirmed this gift, and signified the same to the French Government. The Princess intends to make a cloister round the spot, like the Campo Santo at Pisa, and to cover the cloister walls with porcelain tiles, on which the Lord's Prayer will be read in all the languages of the world.

Doubts appear to have been started as to the existence of lych-gates before the Reformation, principally on account of the majority, in fact nearly all the existing specimens, being constructed of wood, a material, it is supposed, of too perishable a nature to have lasted 300 years without decay. A correspondent in *Notes and Queries* refers to Britton's "Antiquities" (no mean authority), which says that formerly there stood near Gloucester Cathedral a lych-gate, where the corpse of Edward II. rested on its way to interment. Probably much stress will not be laid on the argument of timber being prone to decay, when the fact is remembered that the earliest Christian churches in England were built of wood, particularly in districts where stone was rare. A splendid specimen of lych-gate exists at Arundel, at a church for ages under the patronage of the Dukes of Norfolk. A few years since it was removed from the graveyard and erected as a porch on the north side of the church.

The whole of the remaining works of Mr. Clarkson Stanfield, R.A., deceased, will be disposed of under the hammer of Christie, Manson, and Woods, at the rooms in King-street, St. James's. The sale commences to-day, and will extend over six days. The collection includes the original sketches and drawings made during his various tours—in France, in 1824; Switzerland and Italy, same year; at St. Michael's Mount, Cornwall, in 1828; in Germany, the Tyrol, and Italy, in 1830; on the Moselle, in 1837; again in Switzerland and Italy, in 1838 and 1839, including the series of drawings made during the eruption of Mount Vesuvius, Christmas, 1838; tour in Holland, in 1843; the drawings made between 1847 and 1851, at Hampstead, Dover, and in Wales; tour in the south of France and north of Spain and the Pyrenees, and in 1856 in Ireland. Also the contents of his studio, consisting of armour and arms, bronzes, costumes, models of boats of different countries, Rembrandt etchings and engravings, pictures by Le Poitevin, Constable, and Bright, and water-colour drawings by Sir E. Landseer, Sir A. W. Callcott, Sir D. Wilkie, C. R. Leslie, R.A., David Cox, Muller, and Boningten.

Greystoke Castle, near Ullswater, formerly the seat of the Dukes of Norfolk, was destroyed by fire on Monday morning. It contained many valuable paiotings—portraits of William Warham, Archbishop of Canterbury, and Erasmus, by Holbein; a picture of the Saviour on gold ground, inscribed 1400; portraits of Charles I. and Charles II. and James II.; a large picture of "Solomon's Feast," by Hamilton; a portrait of John Duke of Norfolk, who was the subject of the lines "Jockey of Norfolk, be not too bold, for Dickon, thy master, is bought and sold;" several family portraits, by Vandyke; "A view of Venice," by Canaletti; a piece of needlework by Mary Queen of Scots; and many other art treasures. Some, if not all these, it is feared, have been seriously injured.

Mr. E. M. Ward has just finished three paintings for the corriders of the House of Lords. The subjects are "William and Mary receiving the Lords and Commons," "The acquittal of the Seven Bishops," and "Monk declaring for a Free Parliament."

The municipal authorities of Paris have caused to be erected, in the Valley of Saint Germain, in the Côte d'Or, Burgundy, where the Seine takes its rise, a handsome ornamental edifice; the waters from the various sources are brought together in an artificial cave and fall from the rockwork into a small basin, whence they take their natural course, and form with their confluents the well-known river which enlivens Paris, and in Normandy becomes a grand stream covered with the ships of all nations. Over the entrance of the cave is the recumbent figure of a nymph, with the traditional urn, the work of Mr. Jouffroy, the eminent sculptor. A square or public garden has been formed around the source.

An important undertaking is now under hand in Paris—namely, the piercing of two streets, from the junction of the Rue de la Paix with the Boulevard des Capucines. One of these streets will run from the Boulevard to the Théâtre Français, and form a broad and direct line to the Louvre and its neighbourhood; this street will be about 2,600ft. long. The other, starting from the same point, will pass to the Bourse, and be afterwards continued to the Boulevard Sebastopol, and will be about twice as long as the former. One effect, and a very fine one, will be the formation of a handsome open space opposite the Place of the New Opera House.

The *Pall Mall Gazette*, in an article on Mr. Solomon's sketches, says:—This collection of designs reminds us forcibly how rapidly the mediæval moonlight is fading away from the field of English art before the returning sun of Renaissance and Greek influences. The spirit of Michael Angelo, Raphael, Titian, and Correggio, which Mr. Ruskin in 1851 described as composed of "indolence, infidelity, sensuality, and shallow pride," is again in the ascendant, and everything seems to promise that its new victory will not be easily disturbed. The truth seems to be that art must consent to be an exotic in our northern climate, and in our busy modern life, to renounce popularity, to rest upon literature, and to present the ideals of the cultivated class. It has no medium at its command to express humanitarian impulses, or to hinder or forward any one of the causes which divide the mass of mankind. When we see it returning, therefore, to the old Pagan worship of beauty, to the study of gesture and contour rather than of action or expression, we know at least that these things are within its domain, and that what it has to say in this matter will be clear and attractive, if only to a small audience.

MEETINGS FOR THE ENSUING WEEK.

TUES.—Institute of Civil Engineers.—Renewed discussion upon the papers on Irrigation in India and in Spain, &c.

WED.—Society of Arts.—"On the various Methods of Lighting Streets by Gas, with proposals for the Introduction of a New System," by S. Tucker, Esq.

FRI.—Associated Arts Institute.—Paper on "Art and Artists under the Tudors," by W. Jerrold Dixon, Esq.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

2712 J. SYME. IMPROVEMENTS IN SUPPORTING WINDOW SASHES, SHUTTERS, DOORS, AND OTHER SIMILAR STRUCTURES. Dated September 26, 1867.

This invention consists in supporting window sashes, by elastic rollers formed of india rubber, gutta percha, or compounds thereof, or other similar elastic substance affixed to the sash, and working against the frame in which the sash slides. The rollers are supported with capability of revolving in bearings affixed to the edge of the sash, and should be of such a diameter that, when the sash is in position, they may be slightly compressed by the frame in which the sash slides, and, by the friction obtained by such compression, hold the sash securely in any position required.—Patent abandoned.

2729 S. PARR AND A. STRONG. IMPROVEMENTS IN THE CONSTRUCTION OF BUILDINGS, ARCHES, BRIDGES, AND SUCH LIKE STRUCTURES, AND IN THE FLOORS OF BUILDINGS AND IN OTHER SITUATIONS. Dated September 27, 1867.

This invention comprises various features, among which are the following:—As regards the roofs of buildings, the inventors propose to construct them as follows:—The

framework of the roof being principally of metal, they cover the same by fixing a wood centre to the framework by any convenient means, the said centre being made the desired shape and covered with sheet metal, if necessary. Upon these centres they arrange metallic or earthenware tubes (half tubes in combination with concrete, or they form a coating of concrete only, in which case they mix together ballast, broken brick, or pottery, and Portland cement in varying proportions, according to the strength required, and this concrete may be or spread on the wood centre, or not, as required, to the desired thickness, the outer surface being worked into shape, as in plastering. Where half-round tiles or half tubes are used, they might simply be laid on the wood centre, and their outer surfaces be covered with liquid or semi-fluid cement, or fine concrete, they then apply a coating or covering of ordinary concrete to make up the required thickness. Cylinders or tubes may be laid in the above manner, and be similarly covered. They propose to so fix and dispose some of the tubes of the roof or covering as that they may be used as ducts for the passage of air, water, gas, or smoke when required. They also propose to fix the chimney pots on the roof, and thus dispense with chimney shafts. They propose to form openings for windows by employing barbs of wood, iron, or terra cotta to receive the sash frames or skylights, and they further propose to bed iron fastenings in the concrete for attaching internal or external framings.—Patent abandoned.

2760 T. PARKES. IMPROVEMENTS IN THE MANUFACTURE OF CERTAIN DESCRIPTIONS OF NAILS. Dated October 2, 1867.

The patentee claims the manufacture of nails known as "clasp," or such like description of nails requiring small heads and sharp points, in the manner substantially as described, that is to say, such nails being cut from the ends of metal strips rolled thick in the middle and thin at the edges.—Patent completed.

2776 F. J. JEFFERY. IMPROVEMENTS IN URINALS. Dated October 2, 1867.

This invention consists, first, in supporting the urinal proper on or by hinges or trunnions, or their mechanical equivalents, so that it can be folded up when out of use, and made to lie flush with the wall, wash-stand, or other structure in which it is fitted, and practically be invisible, presenting only its side or back, which can be ornamented in any desired manner. Second, in combining with urinals supported according to the first part of this invention a water supply pipe with a valve or tap therein, so that the folding down into position for use shall open the valve or tap, and allow water to flow, and the folding up close of such flow; and, third, in making urinals constructed according to the first or both the first and second parts of the invention self emptying and closing. For this purpose the patentee forms a receptacle at the back of the urinal proper into which the liquids flow. When these reach a certain weight, the projecting part is over balanced, the contents discharged at the back, and the flow of water shut off.—Patent completed.

2819 D. SWAN. IMPROVEMENTS IN THE MANUFACTURE OF ZINC. Dated October 7, 1867.

This invention consists in separating the zinc from the materials operated on, and condensing it in the form of fume, which is collected and afterwards treated by well-known processes to obtain the pure metal. For this purpose, a cupola blast furnace, or other convenient furnace, is employed, and into it the ore or materials are introduced with such a quantity of coke or other carbonaceous matter as is sufficient to bring the entire mass to the heat that will reduce and volatilise the zinc, when the impurities will sink to the bottom of the furnaces, whence they can be withdrawn from time to time. In order to collect the zinc fume the furnace is provided with a flue leading into a series of chambers of sufficient capacity to allow the whole of the vapours to condense, and the zinc is collected in these chambers and is removed thence to be treated in the ordinary way.—Patent abandoned.

2824 E. BENINGFIELD. AN IMPROVED LIFTING MACHINE, APPLICABLE AS A FIRE ESCAPE AND FOR REPAIRING AND DECORATING HOUSES AND OTHER BUILDINGS. Dated October 8, 1867.

Here the inventor takes three pieces of light metal tubing, or tough light wood, from about 20ft. to 30ft. long, more or less, and hinges or otherwise connects each piece about midway of its entire length, so as to be capable of doubling up when out of use, and of forming three entire long legs when undoubled for use, forming, in fact, three long legs as a tripod stand.—Patent abandoned.

Trade News.

TENDERS.

ADDISCOMBE.—For the erection of St. Paul's Church, Addiscombe. Mr. E. B. Lamb, architect.

Cook	£6649 0 0
Parman and Fotheringham	6600 0 0
Carter and Sons	5979 0 0

Ashby and Sons	215
Piper and Wheeler	208
Sewell and Son	200
Staines and Son	187
King and Sons	172
Woodward	163

NEWCASTLE EMLYN, S.W.—For erecting a new chapel for the Welsh Presbyterians. Rev. T. Thomas, Swansea, architect. Materials fit for use from the old chapel to be taken by contractor at the architect's valuation, and the sum deducted from amount of tender:—

Woodward and Davies	£1491 17 10
Jones and Thomas	1370 0 0
Jones and Williams	1350 13 5
Lloyd and Evans (withdrawn)	1192 7 8
Edwards and Evans (accepted)	1180 0 0

SOUTHEND.—For detached villa, coach house, and stables, for the Rev. A. T. Richardson, Southend. W. Allen Dixon, architect:—

Manley and Rogers	£1065
Mann	1035
Staines	947
Garrod	936
Thorne	917
Garrod (accepted)	855

SOUTHEND.—For detached villa for T. Baylis, Esq., Southend. W. Allen Dixon, architect:—

Manley and Rogers	£880
Mann	860
Staines	778
Thorne	747
Garrod	726
Garrod (accepted)	698

WALTHAMSTOW.—For house on Prospect Hill estate. Mr. W. A. Longmore, architect:—

Munday and Hutchinson	£750
Palmer	745
Bailey	595
Elms (accepted)	580

PROPERTY SALES.

APRIL 29.

AT THE MART.—By Messrs. CHINNOCK, GALSWORTHY, and CHINNOCK.—Freehold (small part copyhold) property, situate in the parishes of Marshfield and Colerne, Gloucestershire, known as the Rocks Estate, comprising about 839 acres of arable, meadow, pasture, and wood land, with noble mansion, park, farms, homesteads, water corn mill, house, and several cottages, annual value £1,701—sold for £51,000.

Absolute reversion to a sum of £20,000 4 per cent. debenture stock, Great Eastern Railway, expectant on the decease of a lady aged 60 years—£7,150.

Life interest, in possession, to £20,000 invested on mortgage, at 4 per cent., receivable during the life of a gentleman aged 77 years—£3,600.

Life interest of a gentleman, aged 42 years, in the income arising from £8,000 invested on mortgage, at 4 per cent.—£3,500.

Life interest of a gentleman, aged 42 years, in the income of £4,000, invested partly in a freehold estate, at Thorpe, near Norwich, and the remainder in bank stock—£1,800.

Life interest of a gentleman, aged 52 years, in the sum of £6,574 19s. consols, expectant on the decease of his wife, aged 55 years—£500.

Absolute reversion expectant on the decease of a lady, aged 55 years, in the sum of £5,479 2s 6d. consols, and in the proceeds of an estate at Arley, Stafford, comprising a residence, cottages, and 192 acres, producing £300 per annum—£5,350.

Life interest of a gentleman, aged 46 years, expectant on the decease of his wife, aged 40 years, in the income arising from trust moneys at present consisting of the following investments, viz.:—160 shares Stockton and Darlington Railway, 5,000 dols. Pennsylvaniau 5 per cents., 52,000 dols. United States 10 40 bonds, £17,000 Great Indian Peninsula Railway debentures, £320 10s. 2d. new 3 per cents., producing about £1,650 per annum—£2,100.

Freehold premises, No. 29, King-street, Cheapside, let at £120 per annum—£1,260.

APRIL 30.

AT THE MART.—By Messrs. Fuller, Horsey, Son, and Co.—Freehold residence, No. 47, Brunswick square, Brighton—£3,980.

Freehold house and shop, No. 98, Shoe lane, Fleet street, let on lease at £82 5s. per annum—£1,600.

Freehold, the "Crown and Anchor" public-house, No. 1, New street hill, Fleet street, let on lease at £70 per annum—£2,120.

Freehold nine houses, four with shops and premises, situate in New street hill, Gunpowder aller, Dove court, and King's Head court, Fleet-street, producing £219 10s. per annum—£3,800.

Freehold house, No. 2, New street hill, let at £18 4s. per annum—£340.

Freehold three houses, one with shop, Nos. 4 and 5, New street hill, and 11, Gunpowder alley, producing £89 2s per annum—£1,380.

Freehold house, No. 12, Gunpowder alley, Fleet street, let at £24 per annum—£410.

Freehold house and shop, No. 93, Shoe-lane, Fleet street, let at £49 10s. per annum—£1,000.

Freehold house and shop, No. 98, Shoe lane, Fleet street, let at £41 8s. per annum—£830.

Freehold two houses and shops, Nos. 97 and 97½, Shoe lane, Fleet street, let at £100 per annum—sold for £1,930.

APRIL 29.

AT THE MART.—By Mr. Davenport.—Freehold residence, known as Chestnut House, Chislehurst, Kent, with coach-house, stabling, and paddock, containing 2a. 3r.—£3,800.

By Messrs. E. Fox and Bousfield.—Freehold cottage villa, known as the Limes, Marlborough place, St. John's wood, let at £63 per annum—£1,460.

Freehold seven houses, Nos. 1 to 7, Lack's cottages, Douglas place, Vauxhall bridge road, producing £110 10s. per annum—£930.

Freehold house, No. 24, Vine street, Westminster, let at £26 per annum—£365.

By Messrs. Candy and Luckin.—Leasehold two houses, Nos. 2 and 3, Upper Mary street, St. Leonard street, Bromley-by-Bow, producing £27 6s. per annum, term 80 years from 1846, at £5 7s. per annum—£135.

Leasehold house, shop, and stabling, No. 24, Wynford road, Islington, annual value £52 15s. per annum—£530.

Leasehold residence, No. 7, Douglas road, Canonbury, let at £70 per annum, term 77¾ years unexpired, at £10 per annum—£830.

By Messrs. Temple and Moore.—Leasehold four houses, Nos. 1 to 4, Church road, Homerton, producing £72 16s. per annum, term 90 years from 1858, at £11 per annum—£600.

Leasehold four houses, Nos. 11 to 14, Temple street, Queen's road, Dalston, producing £88 8s. per annum, term 75 years from 1841, at £10 per annum—£750.

By Mr. Bone.—Leasehold residence, No. 23, Blomfield terrace, Harrow road, let on lease at £70 per annum, term 93¾ years from 1849, at £10 per annum—£650.

APRIL 30.

By Mr. Newbon.—Leasehold residence, No. 5, Highbury Park North, let at £85 per annum, term 94 years from 1854, at £8 per annum—£935.

Leasehold residence, No. 6, Highbury Park North, let at £110 per annum, term 94 years from 1854, at £12 per annum—£1,210.

Freehold four tenements, premises, and gardens, at Hornchurch, Essex, producing £60 per annum—£670.

By Mr. W. H. Moore.—Leasehold house and shop, No. 5, Margaret-terrace, Harrow road, annual value £80, term 21 years from 1861, at £65 per annum—£80.

Leasehold house, No. 112, Chalton-street, Euston-road, let at £38 per annum, term 14½ years unexpired, at £4 13s. per annum—£200.

Leasehold house and shop, No. 12, Northam-buildings, Skinner street, Somers Town, let at £40 per annum, term about 16 years unexpired, at £2 per annum—£205.

Leasehold house and shop, No. 58, Middlesex-street, Chapel-street, Somers Town, let at £53 18s. per annum term 19 years unexpired—£250.

Leasehold two houses and shops, Nos. 11 and 13, Cromer street, Gray's Inn road, producing £80 per annum term 80 years from 1810, at £33 12s. per annum—£320.

Leasehold residence, No 58, Camden-street, High-street Camden Town, let at £65 per annum, term 99 years from 1855, at £6 per annum—£700.

Leasehold residence, No. 170, Stanhope-street, Hampstead road, annual value £55, term 94 years, from 1843, at £ per annum—£840.

By Messrs. Wood, Langridge, and Co.—Freehold residence, No. 3, Brook-street, Hanover-square, let on lease a £200 per annum—£4,990.

THE BUILDING NEWS.

LONDON, FRIDAY, MAY 15, 1868.

FLATS FOR THE MIDDLE CLASSES.*

WHY should the places in which a vast number of the working and lower middle classes of the great towns of England pass the whole of their lives be called their "lodgings?" Throughout every second or third rate street in London we perceive unmistakable signs that the houses generally contain as many families as they have storeys, and sometimes more. And yet every one of them has been planned exactly as if the builder thought it was to be occupied only by a single family. We are not alluding solely to those districts from which the wealthy inhabitants of a past generation have flitted and in which some inconveniences are almost inevitable, but to the rows upon rows of new houses which the builders well know will each be tenanted by several families, but which are planned after the old conventional plan, without a thought of the conveniences of the future occupants. Not long ago we went over one of several houses just built in Foley-street, not far from Langham-place. The once aristocratic street is evidently in a state of decadence, and its houses are one and all peopled like so many rabbit warrens. Yet, if we may form a judgment from the rents demanded of them, we can scarce call the inhabitants less than respectable middle-class people. In the house we visited the terms were placarded in the front window almost before the brickwork was dry, and were for two parlours and kitchen, 13s. 6d. per week; second floor, 11s. per week; third floor, 10s. per week. This betokened that the builder well knew that the house was to be tenanted by "lodgers," and as a further indication of this destination he had adorned the doorpost with a row of no less than six brass bellpulls. These brazen signs deceived us. They induced the notion that we might have stumbled upon a builder bold enough to free himself from conventionality, and to plan a house with some regard to the known circumstances of its future occupation. Our delusion lasted no longer than till we peeped into the "parlour." In this, everything was strictly conventional. Paper of a light pattern decorated the walls, the marble chimneypiece was fitted with a "register" stove, which is, of course, quite a useless affair for culinary purposes, and there was no cupboard room provided beyond the orthodox pair of dwarf "sideboards" or cheffoniers, one on each side of the fireplace. The back parlour was a reduced copy of the front, minus the cheffoniers. The front kitchen, dark as a London kitchen with but a small "area" in front usually is, was fitted with a range, a dresser, and some other arrangements for domestic convenience, which, however, were to be monopolised by the tenant of the "parlours" in consideration of his 13s. 6d. per week. There was a smaller cooking range in the still darker back kitchen, and this apartment, we understood, was to be left for the joint use of the five other families. Whether it was likely to prove of any practical use to persons who would have to descend several flights of stairs to get a fifth share of its "comforts" seemed exceedingly doubtful. On the first floor we found a front room blazing in all the glory of a "satin" paper, a showy mantelpiece, an elaborate cornice, a plaster ornament in the centre of the ceiling, and—nothing else. The back room consisted of four walls with a fireplace, and was a copy of the back parlour. No less than 12s. per week, or £30 per annum, would be the rent demanded for these two apartments. On the floors above the rooms were much the same, except that the papering was less magnificent, the ceilings not quite so lofty, and the rents were a shilling a week less. The whole house was, in fact, an ordinary ten-roomed house, planned exactly like its old neighbours built in the last century, and would have been convenient enough had it been, like them in their first days, intended for the occupation of but one family. In such case the domestic work would have been comfortably performed by the servants in their kitchen, and the members of the family would not have required more accommodation than was provided in their special apartments. When, however, instead of one family, it was to be occupied by so many as six, one could not help thinking that the contriver was very much to blame for providing no more extra accommodation than a separate bellpull to each. A bellpull all to one's-self is not a bad thing in its way. It saves Mrs. Jones having to descend to the bottom of the house and climb back to the top in no amiable mood, through having been summoned in mistake for Mrs. Brown. It will not, at the same time, carry clean water or coals to the top, nor will it convey refuse water, ashes, or vegetables to the bottom, and Mrs. Jones and Mrs. Brown have to do this every day, and several times every day. Why should not a water supply have been provided on every floor, and why should there not have been a shoot provided for conveying refuse to the bottom? In the matter of cooking, too, we wonder how Mrs. Thompson on the third floor, who has but two rooms, and more than two children, manages to prepare a meal for her family. It is out of the question for her to descend to the depths of the back kitchen for her one-fifth share of that apartment, and what with that little grate in her room which has next to no hobs, no oven, no boiler for hot water, no anything, as she says, the whole thing must afford a curious example of that state of existence popularly called "hugger-mugger," from which doubtless both the temper and the digestions of the Thompsons suffer considerably. In describing this house and the inconveniences resulting from its want of special arrangements, we are only describing the normal condition of the whole class of "lodgers" in our towns and cities, and our picture will be recognised as true in thousands of homes, not only of the artisan class but of the comparatively well-to-do class. This matter is of real importance. None can say how very much of our want of social progress, of sickness, and of the daily slackening influence of family ties upon young men, with all its fearful results, are to be traced to the influence of homes where every office of the household has to be performed in the presence of all, to their great discomfort, and where domestic privacy is impossible.

A movement began some twenty or thirty years ago to provide dwellings in flats, that is, complete houses fitted with every convenience upon each floor, for the poorer artisans, and it has met with considerable success among them. The fact of its being a philanthropic movement, however, created some prejudice against it in the minds of the classes just above them, and we are aware of only one building in London divided into flats, and let to tolerably well-to-do occupants of the middle classes.* The prejudice is, however, utterly unreasonable, and no person abroad who has actually lived in a flat, or who in England has had the good fortune to get into some of the very few that exist, shares in it. If a few places were only built they would speedily become popular, and a demand would be created for them. That they would pay is beyond all question. If the artisans' model dwellings, which are let at from 2s. to 2s. 6d. a week per room, pay from 5 to 8 per cent., dwellings for the middle classes, who could afford to pay much more, would satisfy any reasonable investment. We should be glad to see something attempted on the co-operative principle, and with prudent and honest management success might be secured.

Dwellings in flats, however, are no longer built exclusively for the lower classes. They are being adopted by the other extreme of society, and the success of those in Victoria-street (a plan of which is included among our illustrations) has led to the building of others in the aristocratic Grosvenor mansions at Pimlico. Having thus been partially adopted by both extremes of English society, we hope before long to see them adopted by the middle strata, and when they shall have had experience of their comforts, privacy, and convenience, they will wonder that they have themselves been such "flats" as for so many years to dwell in lodgings.

As illustrations, we give a series of plans of the upper floors of houses in flats of four, five, six, seven, and nine rooms, and it will be seen that every flat has its own entrance, with its living rooms, bedrooms, and servants' rooms, water-closet, scullery, and every possible convenience entirely to itself, nothing being occupied in common with other tenants but the common staircase.

* See Lithographic Illustration.

* This is not far from the Walworth-road station, and may be seen from the railway. Its privacy is, however, jealously guarded, and an application to inspect it some time ago was courteously declined.

"NO SUPPER NO SONG."

WE are perpetually told that you can always have anything you want if you are only willing to pay for it. There is, however, one point at least where money alone will not do it, though it should help towards it. No one who is much conversant with the progress of art, and especially of that branch of it which it is our particular function to notice, can doubt that the public, though they have been ready enough with their purses, have by no means got an adequate return in the shape of architectural art for their outlay. When we consider how enormous have been the sums spent in the last twenty years, it is not a little astonishing that so little original art has come of it all. Very beautiful and very accurate copies of old work we have had to satiety, but, with a very few honourable exceptions, simply copies, often in mere execution leaving nothing to be desired except that life which can never lighten up any but an original work. This apparent failure of money to produce what is so much desiderated surely to a large extent arises from the misapplication of it. Architects never have been and never will be all of them artists. But still the building, with its art work and furniture, is erected at a uniform rate of commission upon the cost. This would be fair enough if the architect was also the artist, though even then a man with much business on his hands might naturally, unless very unselfish and very devoted to his profession, hesitate before he devoted to some art detail or design as much time and brainwork as would suffice to get through much ordinary but more paying labour. To hope for real fine art from the mere art workman, except in very exceptional cases, is more than is at all reasonable. But it is just as unreasonable to expect a real artist to design goldsmith's work, carving, and sculpture for 5 per cent. upon the cost of the work when executed. The public should get to understand this. They must be taught that they have no right to expect high art in architectural work without paying for it, any more than they would in such arts as painting. No one who takes an interest in the progress of architectural art can wish the same to happen in its case as has happened with painting. When we claim for the architectural artist adequate remuneration, we do not wish him to be pampered and spoiled as the fashionable painter is. The present enormous income

attainable by a painter who has gained any celebrity renders it all but impossible for him to accomplish great and perfect works. The present unhappy habit of painting for the market such pictures as will please and be sure to sell is only a too natural consequence of over payment. In the case we are advocating there is no chance of the same unfortunate result. All we advocate is a sufficient payment, so that an artist may gain as good an income from art work as he would by devoting himself to the mere architectural or rather engineering part of his business, and that more especially in the adjuncts of architecture as furniture, metal work, utensils, and decoration. If the public will recognise the duty of adequately rewarding art labour they will no doubt get it. They will get into the ranks of architects, or associated with them, many that would never dream of such employment at the present day. But this will not take place without the artist also holding a proper position. So long as the designer for the architect is merely a searcher out of old precedents and a skilful adapter of ancient details, his position of course is, and should be, far below that of the architect. But as soon as the mere copyist and draughtsman ends, and we get real original art design, as the remuneration should be higher so should the estimation in which the artists are held. We should not have to lament the acres of bad stained glass if the architect had recognised the claims of his coadjutor, and the public had admitted the value of true art and been ready to pay for it. If stained glass, no matter by whom it was executed and designed, is to be supplied at so much a foot, it follows almost of necessity that it must be merely a manufacture, and the better artists will have nothing to do with it. The same holds good with all kindred subjects, most notably with metal work, in which scarcely any good works have been executed. The failure here doubtless is owing greatly to the extensive use of machinery, which as a matter of course can only produce a mere manufacture—sufficient indeed for the ordinary wants of man, and keeping up with the prevailing fashion of any particular time—but entirely deadening to anything like art of a high order. The terrible want of art power and feeling cannot be a matter of question to those who study the architectural exhibitions. It is sad to see how little attempt at such a thing is discernible in the designs shown either at the Royal Academy or Conduit-street. We cannot fail to observe how in the best designs, clever arrangement of parts, so as to get a sort of picturesqueness, has to serve instead of really artistic treatment. Some may admire the cleverness of the expedient, but the true art lover can scarcely fail to see the incapacity which the mask of picturesque irregularity or crowded unmeaning ornament hides from the general public. A majority of our architects are not artists, and will not be until we recognise the fact that the art labourer is worthy of his hire; that original work is not only better, but more valuable than that which is commonplace or merely copied; and consequently that a higher scale of remuneration should be given for such work.

It is not in the matter of the design alone that more than a mere percentage is absolutely due for really fine art. A design to reach fine art in execution requires perpetual watching and correction. Art workmen are all very well in their way, but unless they possess the art power and knowledge of the designer, the result will be very different from what he meant, unless he is much upon the spot and aids with his advice and correction.

If an artist has very little to do and a peculiar love for unpaying work, he may, for less than the proper value, spend a long time over his design, and also very carefully watch the progress, and do his best to infuse as much as he can of his own spirit into the art workman that carries out his ideas. This may be done in very exceptional cases, but we have no right to expect it. In the case of those who have much to do it is almost an impossibility. If anyone doubts the immense value of such minute and troublesome supervision, he has only to go to any of the exhibitions of works done for the prizes of the Society of Arts and Architectural Museum. He will then see in numberless instances how a very little personal supervision and instruction would have made all the difference. Of course, if we could hope to get first-rate artists in anything else but painting to do their own work, and not to leave the execution of their design in wood, stone, or metal to the hands of others, we should be better off than we are likely to be with the very best ordinary art workmen, under the most diligent scrutiny of the best artists; but till this is possible or probable, we ought at least to get the next best thing, the artist's accurate supervision of the artisan; and, if we are to have this, in simple justice, and so in the long run to our own interest, it must be paid for. It would be to our own interest because in this case, if an adequate remuneration were given for such work in fair proportion to what is given for ordinary straightforward architectural work, surveying, and engineering, it is almost certain that not a few of those who really have some art in their composition would devote more time to the more congenial labours. It is little less than folly to expect that many will do this unless they are to reap the honour and emoluments due to such work—the one as much as the other. It would be unreasonable to expect the artist to be satisfied with a less honourable position in the world than his less gifted fellow worker, even though the matter of remuneration were in a more satisfactory position. This, too, is a matter for the public to take up to a great extent. If they take the matter up and insist upon the best procurable art, they ought also to know by whom it is done, who really designs and executes, and not only properly pay the proper persons, but give them the honour and fame which are their due. In most of the work that has been done lately no great hardship has arisen, because no great art has been displayed. Too often the accessories to the blank building have been anything but adornments, and so when the architect was not also the designer of the ornamental details, furniture, &c., still he has seldom hurt anyone's reputation by keeping his helpers in the background. He has rather had to bear the blame of the incompetency of his assistants. If an architect is indebted to others for works of art, he ought not to be ashamed to confess it, and let the praise or blame due for the work fall to the right person; but what we especially want is that architects themselves should be more conversant with art, and that more real artists should become architects. This can only come to pass if the study of art and the possession of art power pay as well as the study of construction and kindred subjects. If it does not pay either in the honour given to it or emolument received for it, we may be quite sure that it will not exist to any considerable extent. The matter, therefore, though partly in the hands of architects themselves, is mainly in the power of the public. If they are determined to have good art, they must be ready to pay for it, and they should take some pains to find to whom they are indebted for it.

WINDOW LIGHTS.*

MR. LATHAM'S book is a very opportune contribution to the much-vexed question of ancient lights, and a perusal of it by the builder or his principal will be found both profitable and interesting. It can lie on the table for ready and constant reference, which a newspaper could not well do, and it can be slipped into the travelling bag if wanted. It is not intended that every builder shall be his own lawyer in this matter, which, indeed, would be an absurdity, but it will enable any one to see, cleared of the mists of momentary prejudice, whether any principle laid down in the book does or does not govern the particular case in hand. It often happens, too, that, when an appeal to the law has become inevitable, much needlessly lost time, money, and annoyance may be saved by understanding how to plainly describe a case and instruct a solicitor properly. It is well known in the lower division of the legal profession that nothing is so perplexing or worrying to an attorney, should he also happen to be a good lawyer to boot, than the difficulty of extracting safe and reliable instructions from an uninformed client; indeed, we have known many consultations wasted upon what appears to be a very simple matter, *i.e.*, telling your lawyer what you want him to do, and the material he has to do it with. To such an extent is this felt in some offices that it is no uncommon thing to have a shorthand writer present on important occasions. The client rattles away at what he would *wish* the case to be, but which it is not exactly; he is then examined and re-examined, and bowed out. After he has gone the interview is read over, an immense amount of weeding takes place, and notes for drafting are then made. After some half dozen such meetings the case is fit for briefing to send to counsel, and to counsel it goes. But the anxious client is not aware that he has wasted a deal of valuable time, and added considerably, it may be, to "costs out of pocket." Such a book as the one before us, apart from the interest which the reader will find for himself, is calculated by ordinary attention to correct a source of trouble which every respectable solicitor has long deplored.

"The Law of Window Lights" is divided into six chapters, which chapters are again subdivided into sections. Chapter I. treats of the nature of the right to window lights; II., of the origin of the right; III., of the extent of the right; IV., of the loss of the right; V., of the enjoyment of the right under special covenants; and VI., of remedies for injury to the right. The sections into which the chapters are divided deal with the several heads of each division, and will be found extremely handy. On turning to the section, each one will be seen to have under it every paragraph appertaining to its particular subject, so that the reader can ascertain exactly what he is going to read before he reads it. To persons unaccustomed to the perusal of such technical matter as legal literature this guiding subdivision will be of the greatest advantage, and will enable them to save much time and patience.

The first chapter, treating of the nature of the right to window lights, takes us very far back indeed. We are told that in the English as in the Roman law, light and air were things for all of us, and that no man can acquire a personal property in what absolutely belongs to the whole community. In Stephens's Blackstone, 4th edition, vol. i., p. 160, it will be found that "the elements of light, air, and water" are things which "belong to the first occupant during the time he holds possession of them and no longer." The institutes of Roman jurisprudence always lay down that the enjoyment of these elements is the natural-born right of every individual. As a general principle of law every man is owner of the space over his own land, and may do as he chooses with it, providing he erects no public or private injury. The legal maxim is expressed in Latin, as most legal maxims are, in this way:—"Cujus est solum, ejus est usque ad cœlum"—"to him to whom the soil belongs, belongs everything over it, even to the sky."

* "A Treatise on the Law of Window Lights." By F. L. LATHAM, Esq., of the Inner Temple, Barrister at Law. London: Butterworths, Temple Bar, Publishers to the Queen's Most Excellent Majesty.

A misconception prevails extensively among the general public that a man cannot put in a window overlooking your grounds, and even the owners of grounds have gone to law to have a man's light "put out" in this way. Many cases have been tried, and the pleas have been deterioration in the value of the house and destruction of privacy. The law of England recognises no such right to privacy; a man has another remedy in his own hands, and a very effective one, namely, to build to the boundary line of the offending party up to the height of the delinquent window. Should a builder be engaged at any time in building (say) the gable of a house with window openings, and be at some distance from his principal, upon being called upon by the opposite party to build those openings "blind" he must take no heed, but go on. An action for such opening cannot be maintained, and a number of authorities can be quoted in support of this view. The last and most important we will mention. In what is called the great case of Jones *v.* Tapling, arising out of the building of Tapling's great carpet warehouses, in Gresham-street, behind the General Post Office, that point is supposed to have been finally settled. It went through all the various stages up to the Lord Chancellor. In the course of one of the judgments Mr. Justice Blackburn said: "It is quite true that the opening of a new window looking into the grounds of another may not only annoy this neighbour, but may often affect the value of his property; but the law of England considers that no injury." And the late Lord Justice Turner said, in the same case: "The Court has nothing to do with the diminution of the value of a house caused by its windows being overlooked and its comparative privacy destroyed." This was no later than, we believe, the early part of last year, and may be taken to be the law. Lord Chancellor Westbury remarked:—"There is another form of words which is often found in the cases on this subject—namely, the phrase, 'invasion of privacy by opening windows!' That is not treated by the law as a wrong for which any remedy is given."

The law is somewhat singular when carried to what we might call the "nicest perfection." Supposing a man was building on a plot of ground only big enough for the site of the house, and that it was entirely surrounded by another man's land with the exception of a right of way to it, which, of course, he will have; then, that other man might begin to build, too, wall to wall, and completely hem in the first man all round, except the right of way, and the law affords no remedy. In that case one man would be as much entitled to build as another. But, in France, Mr. Latham tells us, the law is very different on this point. There the owner of land is prohibited opening windows to overlook his neighbour's premises unless he leaves a clear 6ft. of space of his own land between the opened wall and the boundary line. When a window is opened in this way with less space than 6ft., it must be placed at such a height in the wall that nobody can look through it. This law is according to the provisions of the *Code Civile*, which is exceedingly intricate and difficult to unravel.

Then, again, with reference to prospect or view. The Roman law acknowledged it, but the English law never has done so. To be sure, decisions have been arrived at on the side of acknowledgment, but they have been reversed. It has been laid down that "prospect," being only a matter of pleasant view, and not of necessity, no action would lie for stopping it; although it has been admitted that a house with a good prospect must be very superior to one with either a very indifferent one or none at all. "Why may I not build up a wall," said Mr. Justice Twisden, "that another man may not look into my yard? Prospects may be stopped, so that you do not darken the light;" and he reversed a judgment that had been given in the court below. And Lord Hardwicke, when the Court of Chancery was invoked to stop the progress of a building that was interfering with the view of the plaintiff's house, also spoke very strongly:—"You come in a very special and particular case, on a particular right to a prospect. I know no general rule of common law which warrants that, or says that building so as to stop another's prospect is a nuisance. Was that the case, there could be no great towns, and I must grant injunctions to all the new buildings in this town." Again, in another case—"It is true that the value of the plaintiff's house may be reduced by rendering the prospect less pleasant, but that is no reason for hindering a man from building on his own ground." The late Lord Cottenham supported these views in much the same language:—"It is not, as is said in one case, because the value of the property may be lessened; and it is not, as is said in another, because a pleasant prospect may be shut out, that the court is to interfere; it must be an injury very different in its nature and its origin to justify such an interference." It will thus be seen that wherever houses are wanted to be built, no matter what the prospect may be of those already there, they cannot in any way interfere with the extension of new buildings. Were it otherwise, we should be in the position supposed by Lord Hardwicke—"there could be no great towns."

Supposing that a builder was told to bring out a shop a little over some spare ground, and that that advance of frontage obstructed the sideway view of other shops, and the other shopkeepers told him to stop, he would be justified in going on, because the people on each side had no right to the view in front of the encroaching shop. As long as the front of their own window was clear, that was all they could claim. According to the Metropolis Local Management Act the Board of Works are invested with a certain power respecting the regulation of the street line. In the recent conversion, however, of the late St. Martin's Hall, Long Acre, into the New Queen's Theatre, a singular advance was made in the frontage line. When it came out it was only level with the public-house on one side, but considerably before the coach factory on the other. Something was said about it, but, as they stood on their own ground, and were fairly abreast of the line of street on one hand, the only remedy was that the coach factory might, if it had any land, follow the example. The matter dropped at that point, and remains there. In another case an action was brought against the Imperial Gas Light and Coke Company for shutting out the prospect by the erection of a large gasometer; but, as prospect was the only point in dispute, Vice-Chancellor Kindersley, after hearing the arguments, declined to interfere. He said, "As to the ground that the gasometer will prevent the view of persons in Ann's-place, it is impossible that that can be a ground for an injunction." And so the gasometer was built, the prospect shut out, and remains so to this very hour.

In common parlance the right to window lights is commonly spoken of as the right to have an obstructed transmission of air over another man's land, or over any houses that may be standing on that land, under certain conditions, which can only be accurately defined in legal phraseology. This right may be acquired in three ways—"by occupancy, by express agreement, and by implied agreement." In the action between the "Fishmongers' Company and the East India Company," Lord Hardwicke laid down the terms of right in the above manner, and further said, in the course of his judgment:—"If the house were built on the old foundation, it would entitle the plaintiffs to their lights as an ancient messuage; but if on the new foundations then the party must show a new agreement, or something to import one."

We will reserve the remainder of our notice of this book for our next impression.

LAND AND MARINE SURVEYING.*

SURVEYING—that is, the profession of the surveyor—may be said to have received its death blow by the preparation and subsequent publication of the Ordnance plans, as those sheets are termed which are the printed or lithographed results of our great national trigonometrical survey. It is no longer a profession *per se*, but may be justly regarded as a branch, an elementary branch, of that of the civil engineer. A surveyor of the old school, in the strict sense of the term, was decidedly not an engineer, but in the present day every engineer ought to be a sound and accurate surveyor, both theoretically and practically. Mr. Haskoll, in the volume before us, devotes the first two chapters to the sole benefit of those who know nothing about the subject, and although it is difficult for an experienced practitioner to read with satisfaction what is of so very simple, almost puerile, a description, yet we suppose that to many this preliminary portion of the book will be of much interest. The remarks on chaining are strictly practical, and the necessity of performing this operation with great care and attention is strongly insisted upon. In fact, whether the system of surveying employed be that by the chain only, or the chain combined with the theodolite or other angular instrument, the whole of the accuracy of the work is dependent upon the precision with which the chaining, or the actual linear measurement of the ground, is accomplished. It is scarcely necessary to remark that what has to be guarded against in chaining is the tendency to an accumulation of error. An inch out one way or the other in a single chain's length would signify nothing, but let that error be constant for every chain in a mile, and at the termination of that distance there would be a total excess or deficiency in the correct measurement of nearly seven feet. This would be an amount very palpable, and one that would not fail to be discovered by another party, especially if there were interested motives to prove the existence of an inaccuracy. Only those who have had a good deal of chaining to do, in surveys and railway work, are aware of the blessing of a couple of good, well-practised chain men, and when they can be obtained they are worth at least half as much pay again as raw hands. It is unfortunately one of the evils attending the lot of the surveyor that he is seldom able to obtain good chain men, for after having trained up a couple whilst prosecuting a survey in one part of the country, his next job may take him hundreds of miles away, and he has all the trouble to begin over again with fresh recruits.

Supposing the field-work to be finished, it must be borne in mind that it cannot be tested until it is laid down upon the paper, or, as it is technically termed, plotted. For this purpose it is not necessary to plot all the fences or smaller lines, but simply to lay down the main triangles with their test or tie lines, and see whether they come in right. We have frequently tested the general accuracy of our work before leaving the locality, or rather the field of our operations, by plotting the main lines very accurately upon a small scale, and thus testing their correctness. When they join at the right points the work is then said to "close." We agree with the author respecting the inadvisability of making extensive surveys with the chain only, but at the same time confess that they can be so made with perfect and even surprising accuracy. We are, however, directly opposed to him regarding the plotting of the day's work in the evening, unless it be unavoidable, as in the case of Parliamentary

* "Land and Marine Surveying, in reference to the Preparation of Plans for Roads and Railways, Canals, Rivers, Towns, Water Supplies, Docks, and Harbours; with description and use of surveying instruments." By W. Davis Haskoll, civil engineer, author of "The Engineers', Mining Surveyors', and Contractors' Field Book," &c., &c. London: Lockwood and Co., 7, Stationers' Hall-court. 1868.

work, where the time is limited. A man's memory must be very bad if it will not last, in connection with a well and clearly kept field book, for a short time, and, moreover we do not believe that after a hard day's work in the field a man is fit, physically speaking, for the night's task. This remark does not apply to simply plotting the main lines as the survey proceeds to check the general correctness of the work. Chapter IV. is devoted to a description of the uses and adjustments of the ordinary surveying instruments, some of which we scarcely expected to have seen noticed in a modern treatise aspiring to the rank of Mr. Haskoll's volume. Thus the cross staff is a very inferior instrument for setting out right angles to the optical square, or the box sextant. The optical square is unquestionably the proper instrument for accomplishing this indispensable operation, constantly occurring, not merely in surveys, but also in setting out what are known as the "side widths" in railway contract work. It is constructed for this especial purpose, and is in reality useless for any other. Compass surveying and the use of the circumferentor are methods which are illustrative of our remarks, and which we thought had died out with the decline of the "old surveyor," and with the improved scientific principles adopted by those engaged upon the Ordnance surveys. The author observes that he does not consider it "quite so accurate as the theodolite." We consider it not worthy the name of a surveying instrument, and should never think of putting it into the hands of a beginner, or allowing him to regard it as one of his future working tools. On the other hand, we perfectly agree with everything that is remarked respecting the box sextant. It might almost be termed a pocket theodolite, so exceedingly accurately can observations be made with it. When once in thorough order and adjustment, and in the hands of one who thoroughly understands it, both theoretically and practically, angles may be taken with it and calculations made from them which, if afterwards checked with the theodolite, will agree without any appreciable discrepancy. Of all the instruments at the command of the surveyor or engineer, the theodolite may be considered the chief, and there is no description of observation or setting out that does not become comparatively easy when one of them can be obtained for the purpose. It is true that they require to be taken care of and used gently, but a good six-inch theodolite by one of the first makers—and there are not many such—if once properly put in adjustment, will not become deranged in its bearings and details unless subjected to wanton rough usage.

While acknowledging the efficiency of the circular protractor with its two arms, we confess that we give the preference to the semi-circular one, but the truth is, that with due care and attention, work can be accurately plotted with almost any protractor, provided it is correctly divided. Excellent surveys have been plotted to almost minute accuracy with nothing better than one of the best made horn semi-circular protractors, and even with the little ordinary rectangular six-inch ivory one it is surprising how closely careful work will check. A chapter on road and railway surveying and another upon traversing bring to a termination what might be called the first and more elementary portion of this useful work.

The remaining and by far the more valuable part of the volume, at least to the professional man, relates to marine surveying, and embraces the more interesting and less known subjects of harbour, tidal, gauging, and other details connected with the duties of the profession. It is a pity that the author does not abandon, at any rate in this portion of the treatise, the somewhat puerile style that runs through all his writings. As an example we select the following.—"The boatman rows on about eleven strokes." This is nearly tantamount to the observation made in the first chapter, that "The first thing to do is to loosen the cord with which the links of the chain are bound together." One might as well be told that it is necessary to open his mouth before he can eat his dinner. These are blemishes in the style of composition which speak well for the author as a practical engineer, but not so well for him as an author, the more especially as a revision of his work by a competent reviewer would have prevented their constant occurrence. Although not new, the remarks in the eleventh chapter relative to gauging streams are to the point, and the exceptional advantages of the triangular method of arriving at the discharge of streams are clearly put forward, and a table of theoretical discharge over one foot in length of any overfall in cubic feet per minute is annexed to them. In order to obtain the actual discharge of the stream, all that is necessary to do is to multiply the numbers given in the tables by the constant or coefficient proper for each particular instance and by the length of the overfall. Thanks to the labours of our meteorological societies, and those of their distinguished members, the average rainfall for any particular district is already known, and, therefore, it is seldom that one is called upon to ascertain it by direct experiment, although in occasional cases it may be advisable to do so. At page 163 there is a little slip, where it is forgotten that an acre is a square dimension, and consequently there is no such thing as a "square acre." A couple of short chapters upon the drawing and preparation of plans, and upon a portion of the ordinary routine of an office, bring to a close the book before us, which we are happy to say is, in every respect, superior to one by the same author that we reviewed a short time ago. The whole volume is well got up, and the plates are clearly and lucidly lithographed, the lettering—a most important point—being especially well executed. It is true that a great part of the information given therein is better learned practically, but the student who first studies his subject in some standard work, and then applies himself to the practice, or as it were to the proving or testing of what he has read, proceeds to his task infinitely better prepared for it than he who has either neglected the means at his command or been, by unavoidable circumstances, debarred from availing himself of the advantages of preliminary study. A careful perusal of Mr. Haskoll's volume will reward any student or young engineer who wishes to know something of his future duties either previously to or after he has joined an office.

THE DURABILITY OF MATERIALS.

MR. EDWIN CLARK read a paper on this subject before the Institution of Civil Engineers, on the 12th inst. The author expressed the opinion that a series of papers devoted not so much to the special application of those philosophical principles which formed the basis of practice as to the consideration of the principles themselves would be of great interest; as numerous questions occurred which could be more effectually discussed in their abstract capacity than in connection with the practical applications out of which they arose. Well-established fundamental principles had been arrived at on many subjects, which it was advisable should be definitely recorded.

The list of materials used by the engineer was small. It included stone and timber among natural productions, and bricks and cement and the metals among artificial products. It was difficult to state, even approximately, the positive life of either of these articles. The durability of any material depended not only on its own inherent properties, but principally on the agencies to which it was exposed; as, for instance, the effects due to climate.

On examining all the facts, and seeking some common characteristic, it was found that among all the causes of decay humidity held the first rank. The decaying influence of humidity was evidently dependent on other coincident circumstances. The mere pressure of water, or even of a saturated atmosphere, was not sufficient to induce rapid decay, which appeared to be caused by humidity only under peculiar conditions. One of these conditions was well known by the popular title of dampness. The decay caused by dampness, as in the case of dry-rot, was as effectually prevented by the presence of water as by a constant current of air, whether perfectly dry or saturated to any degree of humidity. Damp, therefore, was not the mere presence of moisture in the ordinary form in which it was held in solution by the atmosphere. If an hygrometer were placed in a damp situation it would simply indicate perfect saturation; no evaporation took place, but the cotton covering of the wet bulb was speedily covered by a peculiar mould, well-known by its fungus-like odour, and in a short time it was converted into an impalpable powder or ash. Under similar circumstances, timber, leather, paper, and all like materials, underwent the same rapid decomposition; vegetable gums and oils, that were insoluble in water, and even dry hard paints and varnish, became soluble and liquid. Massive timbers were rapidly disintegrated to the core, entirely losing their weight though still retaining their form; and they were often totally free from apparent moisture, although at times dotted externally by drops of brilliant water. Damp spots were, moreover, peculiarly hygrometric, indicating atmospheric changes with remarkable precision, and temporary desiccation in no way disturbed this process. The peculiar odour which always accompanied this condition was one of the best tests of its existence: and the expression that a room smelt damp was strictly correct. The effects were, within certain limits, intensified by increase of temperature and absence of light, and arrested by poisons destructive to vegetable life. If this phenomenon of decay were more closely examined, the process would be found to resemble, in many respects, a slow combustion. The ultimate results of combustion and decay were strikingly similar; the union with oxygen was slowly effected, and the residue was more or less diluted with foreign substances; but whether bodies were burnt or decayed, the remains in the ashes were substantially identical. Decay might thus, to a great extent, be looked upon as a decomposition resulting from the slow chemical combination of oxygen with the matters decomposed. Now, if slow combustion were the cause of decay, and that particular state called dampness were so important an accessory, the inquiry naturally suggested itself, what connection existed between those agencies, or in what way could damp promote the absorption of oxygen? In the case of organic substances, the presence of vegetation in the form of fungus, or mould, was an invariable characteristic of decay, and the decomposing effect of all vegetable growth was beyond question. It might be said that the vegetable growth alluded to was the effect rather than the cause of decay. Doubtless the spores of microscopic fungi followed the law of all other seeds in vegetating only under the peculiar conditions of soil, light, and moisture which were adapted to their growth; dampness and partial darkness, and absolute quietude, and even decay, might be essential to their existence; and therefore it was only under such conditions that they appeared at all. But, nevertheless, when they did appear, their presence rapidly accelerated the decay, and they furnished a vital medium, capable of accomplishing the observed effect—combustion, or slow union with oxygen, of the substances on which they throve. It was probably by some such chemical vital action, the fact could be explained, that even the hardest rocks were rapidly decomposed by the growth of lichens, or that decay should be arrested by poisons which could exert no other influence than the prevention of vegetation. It was equally remarkable that in the putrefaction or rapid chemical decomposition of animal and vegetable substances, the same profusion of the lower forms of animal, as well as vegetable, organisms characterised the phenomenon.

Whatever might be the cause of decay, moisture was an indispensable element. Dry air was incapable of decomposition. Water was a carrier of oxygen in a potent form: and it was only from water, and more especially when in the form of vapour, that the oxygen necessary for decay could be obtained. The durability of tin and iron roofs in Geneva and St. Petersburg was due to the absence of moisture; and the importance of some shelter for timber, and of thorough ventilation wherever it was employed in this moist climate, was a necessary corollary.

The durability of metals, like that of organised substances, depended, mainly, on the resistance they offered to combination with oxygen; and thus their decay might also be regarded as a slow combustion. But their durability further depended on the character of the oxides formed on their surface. Iron exposed to moisture was soon coated with rust, in the form of hydrated peroxides; and as these oxides did not adhere to the surface, additional flakes constantly formed and fell away, until the whole mass was destroyed. Wrought iron in a pure, dry atmosphere suffered, practically speaking, no deterioration in any lapse of time. It was extremely durable in distilled water free from air; but it was slowly oxidised in a moist atmosphere, and with fatal rapidity in air or water containing free acids or other corrosive agents. It was, however, efficiently protected from such agents by paint, which adhered to clean iron with great tenacity. It was also a fact, not hitherto satisfactorily accounted for, that oxidation was to a great extent arrested by vibration. The painting of wrought-iron girders and roofs, more especially in the neighbourhood of smoky towns, was a precaution of the utmost importance. Every care should be taken to expose the iron as freely as possible to the air, to leave no hollows where water could collect, to avoid the contact of damp earth, and especially of vegetation, and to throw the material into the form of heavy bars rather than thin plates. Painting was more economically performed, and was more effectual, when constantly attended to, than under the vicious practice of laying on three or four coats, and then leaving the work for years, till the paint all peeled off, with a layer of rust attached to it. The Britannia Bridge furnished a striking illustration of the value of this system. The maintenance had been effected by two or three men, constantly on the work, who attended to the slightest symptom of local discoloration. As a consequence, the author did not hesitate to express his firm belief that the total loss from rust of the 10,540 tons of which the tubes consisted, did not in twenty years amount to a single pound weight.

Cast iron, when exposed to the action of sea water, slowly decomposed, the iron being dissolved, leaving behind a graphite or plumbago. The action was, however, superficial, and very slow. It could be preserved by painting, where accessible for that purpose, and by any protection which prevented continual renewal of the surrounding medium, as when enclosed by brickwork or masonry. In fresh water it suffered no such deterioration, and under ordinary circumstances its durability in a pure atmosphere appeared unlimited.

In the case of zinc, although the bright metal oxidised even more rapidly than iron, yet the oxide adhered with such tenacity to the metal that it afforded an efficient protection against the continuation of the process. To this property the metal owed its great durability, more especially as its oxide was insoluble in water. In the presence of any solvent of the oxide, this metal was so speedily destroyed as to be practically useless, unless protected by paint. The destruction of zinc in smoky districts was, however, principally due to galvanic action. A similar action produced the rusting away at the base of iron railings, when fixed in stonework, as was usually the case, by being run in with lead. The contact of copper with the iron plates of a vessel was also a source of great danger; and there were numberless other instances in which the contact of metals of different conducting powers was equally destructive. In all such cases the use of paint furnished, at any rate, a temporary remedy.

It was difficult to over-estimate the value of the introduction of the process of coating iron plates with zinc, by simply cleaning and immersing them in the molten metal. All that had been said on the subject of zinc applied equally to galvanised iron, as it was called. In a clear atmosphere its great durability, its stiffness, its freedom from expansion, and its economy, were all qualities of the highest value; while, on the other hand, without constant painting, it was wholly unfitted for the atmosphere of smoky towns, or manufactories, or even stations where it was exposed to the fumes from locomotives. Both the corrosive and the galvanic actions, which in such cases were so destructive, did not cease with the destruction of the zinc, which was soon effected, but continued also to act, with fatal effect, upon the iron itself, as might be seen in many railway stations and sheds near manufacturing towns. The corrosive tendency in zinc and iron obliged the use of the less oxidisable metals, copper and lead. Lead slowly absorbed oxygen and carbonic acid in moist air. It was acted upon by certain waters, and was occasionally riddled with holes by the larva of an insect; and its expansion and contraction required to be carefully allowed for in its use. Its ductility rendered it a valuable material. Copper might, however, in many instances, be used with great advantage in its stead.

Ordinary oil paint was the most efficient material for protecting either metals or wood from the effects of moisture and air; but all oils, resins, and gums exposed to air, and especially to the light of the sun, oxidised and burnt away with more or less rapidity, leaving a powdery residue behind. As a preservative of paint against the heat of the sun and light, attention was directed to the virtue of a coating of silicious sand, dredged on the paint while wet.

The durability of matter was a subject of the highest philosophical interest. The universal law on this planet appeared to be, that no form should be permanent. Never-ceasing destruction and re-construction were characteristic, within the range of the atmosphere, of everything that existed, whether as regarded organic life or inorganic matter: and it was probable that even the atmosphere itself was subject to the same decree.

ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of this association was held on Friday last, the president, Mr. R. Phenè Spiers, in the chair. The usual routine business was conducted, and Messrs H. Simpson, C. Fuller, and Hagan were elected members. It was announced by the president that at the invitation of Mr. Barlow, C.E., the members would visit the new station of the Midland Railway Company on the 16th inst. Mr. Rickman, the secretary of the Architectural Alliance, attended to request the Association to send four delegates as heretofore to the annual meeting of the Alliance, which would probably be held shortly. Mr. Rickman said that, although the Alliance had not accomplished all that was hoped for at its formation, yet it had been mainly instrumental in causing the adoption in the country of the scale of charges issued by the Royal Institute of British Architects. Through unfortunate and unavoidable circumstances, the last annual meeting was a complete failure, but it was hoped that that would not be the case this year.

Mr. LACY RIDGE, while willing to defer his opinion to that of the meeting, was not—to use his own words—very sweet on the Alliance, neither did he think that the association stood in a true position in sending delegates to the meeting. As a London society, considerable, or at least some, importance was attached to their adhesion to the Alliance, and as the questions within its scope came principally under the notice of practical men, and the great majority of the members of the association were students, he thought that their support was at the best a very weak one, and that at any rate they appeared somewhat out of their place.

Mr. T. ROGER SMITH thought that notwithstanding what had been said by Mr. Ridge, and the lamentable failure of last year's meeting, the association should still continue to send delegates to the Alliance. The Alliance had done a large amount of good, and they should remember that it was their duty to uphold every effort, by whomsoever made, to exalt the position of the profession. He would propose that Messrs. Edis, Rickman, Mathews, and himself, who were the delegates appointed by the association last year, should be requested to act again at the next meeting.

Mr. Smith's motion not being seconded, Mr. Ridett proposed that Messrs. Edis, T. R. Smith, Rickman, and R. Phenè Spiers be elected delegates. A member seconded this proposition, and it was carried.

Mr. LACY RIDGE wished to call the attention of the meeting to a new and improved form of stench trap, manufactured by Mr. J. Antill, of Wandsworth, as being more complete in itself and more effectual against effluvia than any other yet introduced. A specimen was handed round for the inspection of the members, and also a section of the trap.

Mr. MATHEWS then, by way of opening a discussion "On the best means of utilising superfluous heat from ordinary fireplaces," proceeded to describe a suggestion which had occurred to him, and which was referred to in the BUILDING NEWS of February 21, 1868. On the score of economy it was well known close stoves were preferable, but by reason of the English prejudice in favour of an open fire they were by no means generally adopted, and so a vast amount of the heat was wasted. In all the existing means of utilising waste heat, the cold air from the exterior was conducted to the back of the stove, and then warmed and thrown out into the room, and of course a considerable amount of heat escaped up the chimney with the smoke. He proposed to introduce an open chamber or flue at the back of the kitchen range, and carry it right up through the centre of the house to about 5ft. above the top rooms: this flue to be closed at the top. Into this he believed all the heated air would enter. He would then make inlets in the bedrooms, regulated by valves, by means of which the heated air could escape from the flue into the rooms as desired. He did not consider his scheme at all a perfect one, but he thought it at any rate a step in the right direction. He should be very glad if the members would freely discuss it, and find all the fault with it they could.

Mr. T. ROGER SMITH said that he feared the plan would be of little practical use. He thought the air would simply stagnate in the tube or chamber that Mr. Mathews proposed to construct, as it was impossible for a double current of air to pass up and down the tube.

Mr. LACY RIDGE concurred in Mr. Smith's view, and thought that to obtain a current of air it would be necessary in some manner to lay on air from outside. He also thought that, supposing the plan would work, iron-heated air was not by any means desirable in a bedroom.

Mr. RIDETT suggested that the dryness of the heated air, consequent on passing over the iron-work, might in some degree be mitigated by placing a bowl of water at the back of the stove.

The PRESIDENT thought that the members had not taken advantage of the library of the association, and especially had not read Mr. Edwards's book on Ventilation, or they would have been able to criticise Mr. Mathews's plan more fully. He thought there was one fatal objection—the insufficient size of the proposed flue. It was impossible that that small space could conduct sufficient heated air to warm even one room.

Mr. MATHEWS having replied to some of the objections urged, a vote of thanks to him for preparing the subject for discussion was proposed by Mr. Ridge, seconded by Mr. Ridett, and the meeting terminated.

ST. THOMAS'S HOSPITAL.

THE foundation stone of the new St. Thomas's Hospital was laid on Wednesday last, by the Queen, with appropriate ceremony. The old hospital, as will be remembered, was removed to make room for the railway extension at London Bridge, and the managers received a very large sum as compensation from the Railway Company. The new hospital is arranged on the pavilion principle, and is somewhat similar in design to the famous French Hospital La Riboisiére, only, instead of being ranged on two sides of a centre court, as is the case with the French building the plan is extended in a continuous line. The blocks or pavilions are placed at a distance of 125ft. from each other, the distance in the centre court being increased to 200ft., and thus the prominent defect of the La Riboisiére building—the too close proximity of the blocks—is avoided. On the ground floor and first floor the whole length of the hospital is traversed by corridors, connecting the several wards of all the pavilions. These corridors are not carried higher than the first floor, but the flat roof over forms a means of communication to the several blocks of the two pair storey. The pavilions stand at right angles to the corridor, a passage leading direct to the wards, on one side of which is the staircase. The wards will be each 28ft. wide by 120ft. long, and 15ft. high. There will be 28 beds on each, and 1,800 cubic feet of air to each patient. The beds will be placed at distances of 8ft. from centre to centre. Small wards for special cases containing only two beds each are also provided contiguous to the larger wards but not communicating with them. On the opposite side of the passage are the sisters' room, the ward kitchen, and a consultation room for the medical officers. A pleasing feature is the introduction at the river end of the wards of external balconies,

giving a cheerful aspect to the wards, and enabling patients to be placed out in the open air with little trouble. The staircases will be wide and easy of ascent, and the well holes will be occupied by lifts and ventilating shafts. The water-closets, lavatories, and bath rooms attached to each room project from the main building and are divided from the ward by lobbies with windows on both sides.

The hospital proper commences on the first floor and consists of three tiers of wards, four small wards on the ground floor being provided for the reception of accidents. The total accommodation provided for by the plan is as follows:—

	Wards.	Patients.		Patients.
Ground Storey	... 1	... 24 each	...	24
,,	... 1	... 16 ,,	...	16
,,	... 1	... 2 ,,	...	8
First Storey	... 5	... 28 ,,	...	140
,,	... 1	... 16 ,,	...	16
,,	... 6	... 2 ,,	...	12
Second Storey	... 5	... 28 ,,	...	140
,,	... 1	... 16 ,,	...	16
,,	... 6	... 2 ,,	...	12
Third Storey	... 5	... 28 ,,	...	140
,,	... 1	... 16 ,,	...	16
,,	... 6	... 2 ,,	...	12
				788

The general entrance is in the centre, and will be approached from the New Palace-road, Lambeth.

The steward's or superintendent's offices are immediately in front of the hall, and the main corridors branch off from each side, connecting all the departments therewith. The ground floor of the first pavilion to the right is entirely appropriated to the cooking department. The ground floor of the first pavilion to the left is the matron's department, and is provided with a convenient linen store. In the basement of this wing will be extra store-rooms, and living and dining rooms for a class of nurses to be called "The Nightingale Probationers." The remainder of the basement is appropriated to cellars and store-rooms, one part only being reserved for the erection of additional bath rooms if at any time required.

The operating theatres will be large, with a private room attached for the surgeon, and a second room in which a patient may be placed when too weak to be at once carried to his ward. The dispensary and surgery are placed off the main corridor, and the medicine, &c., will be conveyed to the wards by means of lifts. The entrance for out-patients will be in Palace New-road, near Cresier-street. The administration block is at Westminster Bridge end. In the one pair storey, which will be almost on a level with the bridge, will be an entrance hall, waiting-room, counting-house, receiver's-room, strong rooms, almoner's-room, and a suite of offices for the clerk or surveyor of the hospital. On the next floor is the governor's hall and committee-room, with waiting-rooms, &c. The remainder of the block is fitted as a residence for the treasurer, and a staircase leads direct therefrom to the main corridor of the hospital. The two lower storeys are for the residences of three porters and for the offices for the treasurer's house. There will be four houses of eight rooms each, for the resident officers. These will be approached from the Palace New-road, and will communicate at the rear with the main corridors of the hospital.

The chapel is over the entrance-hall, and will accommodate 300 persons. The museum, school-building, lecture theatres, &c., will be placed at the southern end of the site.

With regard to warming and ventilation, reliance will be placed as much as possible on natural ventilation, a simple auxiliary arrangement being contemplated for use at night and in cold weather. Each pavilion will be ventilated independently of the rest.

The building will stand partly on the shore and partly on ground reclaimed from the river. The ends of the blocks next the river have a solid foundation of 22ft. deep over the entire surface. The terrace wall between the ends of the building and the embankment is built on piers and arches. The piers are carried down 50ft. square in concrete, and arches turned from pier to pier in Portland cement concrete.

The foundation stone, which was laid by the Queen, was a fine specimen of Dalbeattie granite, and was supplied by Messrs. Shearer, Smith, and Company, the well known lessees of the Dalbeattie Granite Quarries. The superstructure will be built of red bricks, with Portland dressings, and lined with grey stocks. No other cement than Portland will be used in the building. The brickwork, having brick facings, will be laid Flemish bond, and the rest old English bond. The drain pipes are being expressly manufactured for the hospital by Messrs. Doulton and Co. The interior masonry of the chapel will be Bath stone, from the well-known Corsham Down Quarries. The joiner's work will be superior to the general run of work at present. All glued joints are to be cross tongued; all the locking rails of the doors are to have two double tenons on each edge; and the floors mitred borders round the fireplace slabs. Oak sills of sash frames are to be finished 4in. thick, with outside and inside linings 1in. thick, the back linings ¾in. thick, and pulley stiles of 1¼in. deal. All the girders used will be of Belgian iron. All the detached moulded balusters, terminals, capitals of columns, and pilasters, and the consoles to the second floor windows of the administration blocks will be in Ransome's patent concrete stone.

Throughout the entire building Dennett's fire-proof arches will be used. All the asphalte works, coverings to flats, basement floors, &c., will be executed by Mr. Filkington, of Fish-street hill, who has to maintain his work in an efficient state for five years from the date of its completion. The asphalte used will be "Perrette Volante."

The arrangement of the fire services will provide for the fire cocks to be charged both from the large tanks on the top of each block, and also from the Water Company's main. The fire cocks will be 2½in. metropolitan brigade gauge, and will be of Beck's patent gun metal with two waterways each.

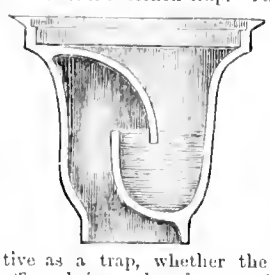
The utmost care seems to have been taken by Mr. Currey, the architect, to ensure perfection of material and workmanship in every particular, and there can be little doubt that when completed, the new St. Thomas's Hospital will be the nearest approach to a perfect building of its kind.

LAON CATHEDRAL.

UNLIKE the generality of French cathedrals, that at Laon has no chevet, but terminates with a square east end, of which we give an illustration. It is of the finest period of French Gothic, having been commenced early the twelfth century, 1112. Mr. Nesfield, in his "Sketches from France," has very fully illustrated this fine cathedral, giving views of its noble towers.

A NEW STENCH TRAP.

THE defects in the ordinary brass bell traps and kitchen sinks are too well known to need comment. Only a week back a correspondent wrote, asking for information, through our "Intercommunication" column, respecting some kind of trap that should "answer its purpose better than that in general use." Our attention has been drawn to a new form of stench trap, patented by Mr. J. Antill, of Merton-road, Wandsworth, which appears at once simple and effectual. It generally occurs in London houses that, by the carelessness of servants, and the perishable nature of the cast-iron material, the gratings are soon broken, and the traps thus transformed into contrivances for the easy admission of deadly gases from the sewers into the houses. This is entirely obviated by the use of Mr. Antill's stench trap. Its action is best described by the accompanying illustration, which represents it in section. It is complete in itself, can be easily cleaned out, and effectually prevents articles being lost by passing into the drain. It is also equally effective as a trap, whether the grating be on or off, and is made of pure pig lead, at a price much cheaper than the ordinary trap. Dr. Connor, sanitary inspector to the Wandsworth Board, has seen the trap, and highly approves of it. He intends to bring it before the board, possibly with a view to its general introduction. At the Architectural Association, where it was introduced to the notice of the members present on Friday last, it seemed to meet with general approval; and we think the qualities in it, to which we draw attention, are sufficient to ensure for it, at the hands of architects and builders, a fair trial, and consequently a considerable amount of favour.



THE ARCHITECTURAL RELICS OF INDIA.

THE Governor-General of India, in council, has resolved to collect information concerning the architectural relics of India. To effect this he asks for the insertion, in every annual administrative report, of a separate chapter on archæology, in which the local governments are requested to notice the condition of all works of art mentioned in certain tests required of them. In the matter of obtaining casts and photographs of the most important architectural works of India, the Governor-General suggests that information may be obtained from H. H. Lake, the Principal of the School of Art in Calcutta. This movement is most likely the offspring of the publications of the Architectural Photographic Association of India. It is no doubt high time that steps should be taken for preserving records of the ancient glories of India. These will not only be an infinite source of interest to the natives, but they will be regarded with curiosity and admiration in this country.

CUPOLAS FOR IRON FOUNDRIES.

AT a recent meeting of the Institution of Mechanical Engineers, held in Birmingham, a paper was read "On an Improved Cupola for Iron Foundries," by Mr. J. Eichhorn, of London. In this cupola, which is the invention of Mr. Henry Krigar, of Hanover, the objects aimed at are to concentrate the heat in the lower part of the furnace, and render the action uniform throughout the operation of melting, and to prevent the blast from injuring the heated metal by oxidising it. The vertical shaft of the cupola, which is made rectangular in form, opens into a lower chamber, the bottom of which forms the hearth to receive the melted metal. Round the bottom of the shaft runs an air passage, into which the blast is delivered from the air main; and the blast entering through this passage cools the brickwork of the cupola, and becomes heated itself; it then passes down into the melting chamber of the cupola through two long slots in the roof, one at the front and the other at the back, extending the whole breadth of the hearth. The front of the furnace is closed by an iron door on hinges, extending the whole breadth, and lined with clay and sand on the inside; and a smaller door is placed at the back to facilitate the drawing of the furnace after each heat. The cupola is charged from the top of the vertical shaft in alternate layers of coke and iron as usual, a filling of coke being first put in for starting before closing up the front door. In the working of the cupola the coke falling into the melting chamber from the vertical shaft stands there in a heap, upon which the blast rushes through the two transverse slots in the roof and the heat from the burning fuel being radiated into the air passage the blast becomes prepared for combining rapidly with the carbon of the fuel before it has an opportunity of coming in contact with the melting metal and wasting it by oxidation, and the action of the blast is finished at a considerably lower level than in ordinary cupolas. The metal obtained in this cupola is found to be very fluid, more so than in an ordinary cupola, while retaining its softness, and the consumption of coke is from 1¼ cwt. to 1½ cwt. per ton of iron melted, according to the magnitude of the charge, the loss of metal in melting being only from 2¼ per cent. to 3½ per cent.

The old saying that we ought not to look a gift horse in the mouth has been disregarded, and most likely properly, by the Liverpool Town Council. Mr. Gower, an English merchant, who recently died at Marseilles, left, on certain conditions, a collection of pictures and works of art to the town of Liverpool. A deputation of the council, who had inspected the collection, reported that none out of about 400 pictures was worth more than £5; while the bronzes—described as old classic works—were of the coarsest modern manufacture, and not even "aged" artificially to imitate long buried works of Roman and Greek art. A question, however, of some importance arises, namely—was the deputation capable of forming an accurate opinion on art works.

ARCHITECTURAL MUSEUM.

A REPORT signed by A. J. B. Beresford Hope, president; George Gilbert Scott, treasurer; and Joseph Clarke, Hon. Sec. of the Architectural Museum has reached us, and we are glad to learn that the building in Westminster has so far progressed that it will shortly be roofed in. In the course of collecting the fund for building, many most encouraging incidents have occurred, showing the evident appreciation of the step the council have taken. Inquiries have been received from kindred societies respecting space for them in the new premises; new annual subscribers have been added to the list, and new friends and connections secured; many art-patrons hitherto not contributors have come forward with donations for the building fund; and the following offers of materials, &c., have been generously made. Messrs. Clarke and Co., of Rathbone place, have undertaken to fit up the two ground-floor front windows with their patent steel revolving shutters, and Messrs. Bunnett and Co, "in acknowledgment of their employment by most of the chief members of the architectural profession during the last thirty years," volunteered similarly valuable assistance on their hearing of the proposed removal of the collection; the six iron principals for the roof are a gift from Messrs. Kelk and Lucas; Messrs. Burt and Potts promise iron casements for some of the windows; Messrs. Foucard liberally contribute the Caen stone required for the interior of the building; Messrs. Rust and Co. offer glass and mosaic material; Mr. Godwin, of Lugwardine, in addition to £20, will make some ornamental tiles, specially designed for the front of the building; Mr. Fabbrieotti promises carved Carrara marble, of the value of £50; Messrs. Strode and Co. add to a donation of £10 10s., a present of one of their patent gas sun-burners, fixed free of charge; Mr. Chas. Hudson undertakes some coloured decoration; Mr. Robert Chapman (art workman) is willing to make a piece of furniture; Mr. E. Whitehead (art workman) offers to execute some carving; and Mr. N. Thwaites has contributed a model of the museum front.

The building fund now at the disposal of the council amounts to about £2,000, and a further sum in addition to the grants above specified will be wanted to defray the cost of the building alone, exclusive of the legal charges for the lease and of the many incidental expenses unavoidably incurred from the time of selecting the site to that of the removal of the collection to its new home. The council therefore appeal with renewed earnestness to all friends of the museum, for assistance in the useful work they have undertaken.

THE NEW CORN WAREHOUSES AT LIVERPOOL AND BIRKENHEAD.

THE new warehouses built by the Mersey Docks and Harbour Board at Liverpool and Birkenhead for the accommodation of the corn trade of the Mersey are nearly completed, and when finished and at work will be the most perfect buildings of the kind in the world. On the Liverpool side the new warehouses, which are fireproof throughout, have been built on the site of the old Waterloo dock, and comprise three blocks forming a quadrangle, within the margin of which is the corn warehouse dock. The total length of the building is 1,485ft. by 70ft. in width. Besides the quay floor there are five storeys available for storage, and a sixth which is appropriated as a machinery floor. The aggregate clear internal area, including the quay floor, is 11¾ acres. The height of the building from the quay to the top of the cornice is 82ft. The storeys, with the exception of the quay floor, which is 15ft. 3in. high, are 9ft. 3in. from the surface to underside of girder above. Every attention has been paid to the relative strength of each part of the structure, the breaking strain of the beams and girders being three times the load they are intended to carry. An idea of the vast capacity of the warehouses may be gained from the fact that the total weight of grain upon the floors when fully loaded will amount to not less than 77,660 tons. The clear aggregate storage area of all the floors, exclusive of the quay and site spaces, is 48,918 square yards, affording storage capacity for 196,000 quarters of grain. Rails are laid within the warehouses, forming a communication with the main dock line.

Throughout the building the machinery for hoisting and distributing the grain is worked by hydraulic power. There are five self-acting, traversing, rocking cranes for raising the grain in tubs from the hold of the ship. Each crane is capable of raising a ton of grain at a time at the rate of 50 tons per hour, through an extreme distance of 136ft. Having brought the grain to the machinery floor at the top of the warehouses, the cranes discharge it into hoppers, from which, after being freed from dust, it is weighed by a single operation in one-ton lots, and then transmitted by a most ingenious arrangement to any part of the warehouses. This work of transmission is effected by means of endless bands, of which there are two running the entire length of the three stacks of warehouses. This system, we believe, has never before been introduced into England. We witnessed a trial of it on Tuesday last, which was successful in every respect. The bands are of vulcanised india-rubber, 18in. wide, and traverse at a speed of about 500ft. per minute. They are capable of transmitting grain from end to end of the warehouses at the rate of 50 tons per hour. There are shoots for passing grain from one floor to another, into the holds of vessels, or into waggons beneath. Besides one crane there are eleven hoists for barrels and sacks, and twenty jiggers for lowering purposes. The machinery has been supplied by Sir William Armstrong. Mr. J. F. Lyster, the engineer to the Mersey Docks and Harbour Board, has designed and superintended the erection of the whole of the buildings and appliances. The Birkenhead warehouses are in many respects similar to those on the Liverpool side of the water, and are fitted up in the same manner. Their storage capacity is 212,800 quarters of grains. They are not fireproof, but, like the Liverpool warehouses, have been designed by Mr. Lyster. When completed the warehouses on both sides of the Mersey will be handed over by the dock board, under a ten years' lease, to the Liverpool Grain Warehousing Company.

A SARACENIC PULPIT AT SOUTH KENSINGTON.

IN the large court of the South Kensington Museum, says the *Pall Mall Gazette*, will shortly be set up a towering structure some thirty feet high, a Mahometan pulpit from a mosque in Cairo. The work presents a pretty façade composed of a door inlaid with ivory, surmounted by a honeycomb or stalactite cornice; seven steps lead to the platform, above which, in place of sounding board, rises as a crown a decorative canopy rich in detail of Saracenic ornament. The work, with other specimens of Saracenic art purchased for the Museum, formed what is known as the "Meymar collection." These relics, when brought to the Paris Exhibition, naturally excited the rapacity of the South Kensington authorities, who deemed, and we think rightly, that such Eastern products, the like of which seldom find their way to Western Europe, would supply important connecting links in the long historic chain of national arts and industries which it is the professed province of the Brompton Museum to illustrate. This Meymar collection was, we believe, first brought under notice by the Rev. Greville Chester, who recommended it to Mr. Cole. It was then examined and reported on by Mr. J. C. Robinson, Mr. Owen Jones, and Mr. Reginald Stuart Poole. It is no secret that it is mainly due to the elaborate report of the last gentleman, who was selected for his authoritative knowledge of Egypt, modern as well as ancient, that the purchase was made.

The South Kensington pulpit presents a deep, rich tone, which in part is due to the dust of ages, in part to coarse restorations, and let us hope in part also to some remnants of that original colour which shone in prismatic splendour four hundred years ago. It is quite possible that close examination of existing textures and surfaces may yet enable those best versed in Arabic or Moorish decorations to determine how this pulpit was painted when first it came from the hands of Egyptian artificers. Mr. Owen Jones is of opinion that, in the Alhambra at all events, each surface by its first design and position determines its ultimate colour, and hence that form alone may be taken as a true index to polychrome compositions, however complex. However that may be, we trust the authorities at South Kensington will abstain from making any conjectural restoration.

The Indian Government has advanced 52,000,000 of rupees towards the completion of the waterworks of Calcutta.

CHIMNEY BUILDING.*

ON the 22nd of April last Professor Macquorn Rankine gave an account of a chimney recently built at the West Cumberland Ironworks. The chimney now described presents nothing new in design or construction, and is not of any extraordinary size or figure; but as it is a successful example of the application of correct principles and good workmanship to a structure of a useful and ordinary kind, the publication of an account of it may prove serviceable. It has now been in operation for about eight months, and has withstood the gales of an unusually stormy season.

DUTY.—The duty which this chimney has to perform is to carry off the gaseous products of combustion from four blast furnaces, and from various stoves and boilers that are heated partly by burning the inflammable gas from the blast furnaces, and partly by coal. The total quantity of solid fuel consumed may be estimated at about 10½ tons per hour when all the furnaces are at work.

FIGURE AND DIMENSIONS.—Above ground the chimney is a frustrum of a cone with a straight batter. Underground there is a plinth or basement, octagonal outside at the ground line and square at the bottom; cylindrical inside, and pierced with four circular openings for flues. The reason for adopting a straight batter, notwithstanding that a curved batter enables certain theoretical conditions to be more perfectly fulfilled, is that the accuracy of building with a straight batter can be tested at any moment by a glance of the eye, without the aid of instruments. The principal dimensions are as follows:—Height above the ground line, 250ft.; depth of foundation below the ground line (including a layer of concrete 3ft. deep), 17ft.; total height from foundation to top, 267ft. Inside diameter at top of cone, 13ft.; inside diameter at 2ft. above bottom of cone, 21ft. 10in.; inside diameter in basement, 18ft. 10in.; inside diameter of arehways for flues, 7ft. 6in.; outside diameter at top of cone, 15ft. 3in.; outside diameter at 2ft. above bottom of cone, 25ft. 7in.; outside dimensions of square basement, 30ft. by 30ft.; outside dimensions of foundation course, 31ft. 6in. by 31ft. 6in.; outside dimensions of concrete foundation, 34ft. 6in. by 34ft. 6in. The change from the square to the octagonal shape in the basement is made gradually by stepping the brickwork at the corners.

THICKNESS OF BRICKWORK, STABILITY, AND LOAD.—It had previously been ascertained by observation of the success and failure of actual chimneys, and especially of those which respectively stood and fell during the violent storms of 1856, that in order that a round chimney in this country may be sufficiently stable, its weight should be such that a pressure of wind of about 55lb. per square foot of a plane surface directly facing the wind, or 27½lb. per square foot of the plane projection of a cylindrical surface, that is to say, a pressure equivalent to the weight of a layer of brickwork 3in. deep, and of an area equal to the vertical section of a round chimney, shall not cause the resultant pressure at any bed-joint to deviate from the axis of the chimney by more than one quarter of the outside diameter at that joint. (See "Proceedings of the Philosophical Society of Glasgow for 1856," p. 14). By calculating according to that principle the thicknesses of brickwork in the cone were determined to be as follows:—Uppermost 80ft. of height, one and a half brick; next 80ft. of height, two bricks; next 88ft. of height, two and a half bricks; lowest 2ft. of height, increasing by steps from two and a half bricks to four bricks, in order to spread the pressure on the basement. The bed joint of least stability is 2ft. above the ground line; and the deviation of the resultant pressure from the axis of the chimney at that joint which would be produced by such a wind as has been mentioned is 6ft. 4in., being a fraction of an inch less than one-fourth of the outside diameter. The thickness of the arching in the openings for flues is three bricks. The following are the intensities of the mean pressures due to the load on different bed-joints:—At 2ft. above the ground line, eight tons on the square foot; in basement, at the springing of the arches, three tons on the square foot; on the upper surface of the concrete, two tons on the square foot; on the ground below, 1·6 tons on the square foot.

FIREBRICK LINING.—The thicknesses of brick-

* Read before the Institution of Engineers in Scotland, by W. J. MACQUORN RANKINE, C.E., LL.D.

work already stated include the firebrick lining, whose thicknesses are as follows:—In the uppermost 16ft. of the cone, one-half brick; in the lower part of the cone, the basement, and the flue archways, one brick. The firebrick lining is bonded with the common brickwork in the ordinary way, the only difference being that the firebricks are laid in fireclay and the common bricks in mortar. The reasons for adopting this mode of construction in preference to an internal firebrick chimney are as follows:—First, when the firebricks are bonded with the common bricks they contribute along with the common bricks to the stability of the chimney, whereas if an internal firebrick chimney had been used an additional thickness of common brickwork would have been required in order to give sufficient stability to the outer cone; secondly, unless the internal chimney is carried up to the top of the outer cone there is a risk of damage through the explosion of inflammable gaseous mixtures in the space between; and, thirdly, under the same circumstances there is also a risk of the cracking of the outer cone at and near the upper end of the inner cone through unequal heating at that place. Vertical cracks in a chimney are the more dangerous the higher the level at which they occur; because the safety of the higher part of a chimney depends more on cohesion and less on weight than that of the lower part. When such cracks take place near the ground they are of little or no consequence. The basement is paved inside with 6in. of firebrick resting on 6in. of common brick which rests on the concrete.

Ordinary Brickwork.—The ordinary brickwork is built of white bricks of very good quality, supplied by the Iron Company. It is built in English bond. In the basement there is one course of headers to every two courses of stretchers; in the cone one course of headers to every three courses of stretchers. Strips of No. 15 hoop iron, tarred and sanded, are laid in the bed joints of the cone at intervals of 4ft. in height, with their ends turned down into the side joints. Care was taken to bed the hoop iron on the common brickwork, and not on the firebrick lining. The length of hoop iron in each bed joint in which it is laid is twice the circumference of the chimney.

Mortar.—In the concrete foundation, the basement, and a small part of the cone, the mortar was made of hydraulic lime. Owing to an unexpected difficulty in obtaining such lime on the spot, it had to be brought from a distance at considerable expense; and, therefore, the mortar for the rest of the building was made of a very pure lime from the immediate neighbourhood, rendered artificially hydraulic by a mixture of iron scale from the rolling mills at the work; it having been in the first place ascertained that the supply of iron scale could be furnished to the contractor with sufficient rapidity. The following are approximately the proportions of the ingredients of the mortar by measure:—Lime, 2 measures; scale, 1 measure; sand, 5 measures—total, 8 measures. It is scarcely necessary to state that the use of iron scale for hardening mortar and making it artificially hydraulic is familiar to engineers, architects, and builders in Glasgow and its neighbourhood; but in many other parts of the country that process appears to be less known than it deserves. The principal constituents of the iron scale are probably silica and protoxide of iron; but its action upon lime, and the nature of the artificial cement which it forms, have not hitherto, so far as I know, been investigated by chemists. Considering the benefits that have arisen from the chemical analysis of other cementing materials, it is much to be wished that some chemist should undertake the examination of this material also.

Cast-iron Curb—Lightning Conductor.—On the top of the chimney is a pitch-coated cast iron curb 1in. thick, coming down 3in. on the outside and inside. The lightning conductor is a copper wire rope about ¾in. diameter. It terminates in a covered drain in which there is always a sufficient run of water.

Scaffolding.—In the construction of the internal scaffolding care was taken that the needles or horizontal beams should be supported wholly by the brickwork, and not by the upright posts; for great danger has been known to arise from the brickwork coming to bear upon the ends of the needles, and through them on the posts, owing to the settlement of the lower part of the chimney.

Precautions against too Rapid Building.—In order that the concrete foundation might have time to harden before being subjected to a heavy load, it was made by the Iron Company themselves before the contract for the chimney was let; for it is known that intense pressure tends to retard the hardening of concrete. The progress of the building was restricted by the specification to a rate not exceeding 6ft. of vertical height per day.

Contract and Execution.—Tenders were taken from a limited number of builders in the north of England and in Scotland; and the lowest offer was accepted, being that of Messrs. William Wilson and Son, of Glasgow. The work was executed by that firm in a manner that left nothing to be desired.

Cost.—The following were the amounts of the estimated and actual cost respectively:—Engineer's approximate estimate, £1,672; actual cost, including designing and superintendence, £1,560; being at the rate of almost exactly 4d. per cubic foot of the whole space occupied by the building, which is 94,000 cubic feet, nearly.

Present Temperature and Draught.—According to the last account the temperature inside the chimney when doing about three-fourths of its full duty is 490 deg. Fah.; and the pressure of the draught is 1⅞in. of water; which agrees to a very small fraction with the pressure as deduced theoretically from the temperature and the height of the chimney.

Comparison with some other Chimneys.—The dimensions and stability of the chimney which has just been described are nearly the same with those of the second highest chimney at St. Rollox Chemical Works, built about ten years previously, except that in the older chimney the joint of least stability is 100ft. above the ground. In the great St. Rollox chimney, 455½ft. high from foundation to top, the greatest pressure of wind which can safely be borne is almost exactly the same, viz., 55lb. per square foot of a plane surface, or about 27½lb. per square foot of the plane projection of a cylindrical surface. The bed joint of least stability is 210ft. above the ground. In the great Port Dundas chimney, 468ft. high from foundation to top, the bed joint of least stability is 200ft. above the ground; and the greatest safe pressure of wind is 67lb. per square foot of a plane surface, or 33½lb. per square foot of the plane projection of a cylindrical surface; so that here it may be considered that there is an excess of stability.

PARLIAMENTARY NOTES.

On Tuesday evening in the House of Lords, Viscount Hardinge asked what steps the Government proposed to take with respect to the preparation of designs and plans for the new National Gallery. The Earl of Malmesbury said that on receiving the report of the committee of which the noble viscount was chairman, the Government communicated with the trustees of the National Gallery. The trustees reported to the Government on the subject, and gave some very valuable advice. Plans would be prepared in accordance with the suggestions of the trustees; but in consequence of the report of the judges, his noble friend the First Commissioner of Works had not yet decided who the architect should be. He was not at present able to say whether it was intended to purchase the site of the barracks adjoining the National Gallery for the purposes of the new gallery, but he would make inquiry and give an answer on a future evening. Lord Overstone urged that no delay should take place in the building of the gallery, as several of the pictures in the National Gallery were being seriously injured through want of room.

On the same evening in the House of Commons in reply to a question by Mr. Layard, as to the progress made in appointing a Commission for the preservation of ancient monuments in India. Sir S. Northcote said that the Governor-General, in consequence of communications which had passed between him and the Secretary of State for India, had had certain resolutions passed in Council both for the better conservation of monuments and also for taking accurate photographs of them, and transmitting them to this country. These measures would apply not only to Bengal but to the north-western and central provinces, and would be carried out by officers named from the Public Works Commission, selected on account of their training and knowledge of the subject. By this means we should be able to secure correct representations of these interesting objects.

On Tuesday Lord Denman rose in the House of Lords to call attention to the uncertainty which prevailed as to the adoption of any plan for the New Courts of Justice. A certificate had been given that the cost of the undertaking would not exceed £1,500,000, but it was probable that by the time they were finished on the scale proposed, the cost would exceed that of the Abyssinian expedition. The Lord Chancellor said that the referees appointed by the Treasury, who were to determine to which of the plans exhibited the award of superior execution ought to be given, were unable to agree that any one of the plans exhibited in competition was the best, but they selected two, and made an award that they thought the interior plan of one of the competitors and the exterior plan of another were the best. That award having been made, some of the unsuccessful competitors objected to it as being beyond the power of the referee. They said, "We entered into competition each one against every other, but not into competition with the joint production of two others." In the memorandum of the terms of competition it was stated that any matter in dispute should be referred to the decision of the Attorney-General. That had been done, and he believed the reference was still going on, and until concluded it would not be in the power of the Commissioners for the erection of the Palace of Justice to take any steps in regard to the selection of any plan. He hoped that before long the reference would be terminated, and that the Commissioners would then be allowed to proceed with the erection of the building.

Building Intelligence.

CHURCHES AND CHAPELS.

The chapel of St. Anthony, Crowley, Devon, was consecrated last week, by the late Bishop of Gibraltar. The style is Early Decorated. The materials used are Westleigh stone, with Bath stone dressings. Mr. Hawkins, of London, was the architect, and Mr. J. P. White the builder. The stone carving is by Mr. Hurley, of Taunton.

On the 31st ult. the parish church of St. Peter, Roborough, Devon, was reopened after restoration. The church consisted of a nave, south aisle, and chancel. About three-fourths of the walls have been rebuilt, the waggon roof has been abolished and open timbered roofing substituted, a chancel arch has been erected, and a vestry added. The floor and altar steps are laid with Maw's encaustic tiles. The total cost of the work is £900. Mr. Henry Lloyd, of Bristol, is the architect, and Messrs. Cock and Grant, of Torrington, are the contractors.

On Friday last the Earl of Dalhousie laid the foundation stone of a new English Presbyterian church in Camberwell. The church will accommodate 850 persons, and will cost £4,000.

St. Martin's Church, Dorking, which has recently been enlarged by the addition of a chancel, was reopened by the Bishop of Mauritius last week. The architect, from whose designs the works have been carried out, is Mr. Henry Woodyer, of Graffham, near Guildford. The contractors were Messrs. Wheeler Brothers, of Reading, the amount of the contract being £6,000.

On Sunday week services were held to commemorate the reopening of the Unitarian Chapel, Northampton, after enlargement. The enlargement consists of a partial lateral extension to the west, affording additional accommodation for 100 persons. The cost of the work is about £800. Mr. Hall is the architect, and Messrs. Clarke and Heap the builders.

New churches are about to be built at Ellechpoor, Akola, and Budnacra, in India.

On Saturday last the foundation stone was laid of a new Wesleyan Chapel, at Lower Broughton, near Manchester. The building will be in the Italian style, and will seat 800 persons. Its dimensions will be 79ft. by 52ft. (outside measurement), and it will have an exterior of pressed bricks with Yorkshire stone dressings. The chapel is to cost £5,000. Mr. William Waddington, of Burnley, is the architect, and Mr. Foggett, of Cheetham, the contractor.

On Monday the new church of St. James, Stockton, was consecrated by the Bishop of Durham. The cost of the building is £6,000, and it will be one of the most complete ecclesiastical structures in the diocese.

A new United Presbyterian Church is about to be erected in Toward-road, immediately adjoining the New Park, Sunderland, from the design and under the superintendence of Mr. Thomas Oliver, architect, of Newcastle-upon Tyne. It will be in the Gothic style of architecture, with walling of local limestone and sandstone dressings.

On Tuesday the new church of St. Nicholas, Cramington, was consecrated by the Bishop of Durham. The building is Early English, with a strong leaning in the details towards French Gothic. It consists of a chancel 21ft. long by 20ft. wide, and a nave 22ft. 6in. wide by 65ft long, with north and south aisles, porch, vestry, and organ chamber. Seats are provided for over 650 persons. The cost of the church is £3,000 The contractors are Messrs. Waterson and Stafford, of Morpeth.

BUILDINGS.

The new school chapel in connection with the Castle Howard Reformatory, York, was opened last week. The style is plain and unpretending, and in accordance with the reformatory itself. The cost was £700. Mr. J. L. Pearson, of London, is the architect.

A building for the use of the members of the Working Men's Club, Oldham, was opened last week by the Mayor (Mr. John Robinson). It contains several rooms on the ground floor, including a newsroom, and a room for bagatelle, &c. On the second storey is a large room, which will be devoted to educational purposes; and behind the building is an excellent bowling-green, and also a gymnasium. The total cost has been £1,313.

On Thursday week the new "Brunnell" wing of the Newcastle Ragged and Industrial Schools was inaugurated. Increased accommodation is provided for 60 inmates and 100 day scholars. The works were designed by Mr. Thomas Oliver, of Newcastle, and carried out by Mr. William Gibson, contractor, of Red Barns.

The *Bombay Builder* says a pauper hospital, or a hospital for incurables, is much needed in the city of Calcutta.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—C. F. H.—T. B.—T. G. H.—C. K.—R. and B.—J. C. J.—T. R. S.—E. W. G.—W. B.—I. L. D.—R. B.—I. A.—H. J. and Co.—W. C.—R. D. and Co.—P. B. A., with photograph of Albert Memorial Museum.—H. THE MANCHESTER TOWNHALL DESIGNS.

To the Editor of the BUILDING NEWS.

SIR,—In both the preliminary and final stages of the competition, there is perceptible in the designs a marked absence of that principle upon which alone great works of architecture have ever been or can be produced, a principle that underlies all that charms the intellect and imagination in the Egyptian and Greek temples, and those Gothic cathedrals whose organic construction is more marvellous still. I do not know that this elementary law has ever been more concisely propounded than by Greenough, the American sculptor, in a letter to his countryman, Emerson, some thirty years back:—"Here is my theory of structure: A scientific arrangement of spaces and forms to functions and to site; an emphasis of features proportioned to their *gradated* importance in function; colour and ornament to be decided and arranged and varied by strictly organic laws, having a distinct reason for each decision: the entire and immediate banishment of all make-shift and make-believe."

By this standard, one would expect to find the great hall, the council chamber, the banqueting and reception rooms, noble in function as in dimensions, severally and distinctly expressed, each in its order of importance. But what do we see? Masses and groupings without relation to plan; and the observer vainly seeks for what is foremost in his mind, the hall itself. For this predominant feature, the stamp and designation of the pile, he may, and that only if he penetrate the structure, find an interior. Nor is the outward and visible sign of what *is* spaced on the grand front distinguished by specific accordance with the internal arrangement. The apartments and rooms are one thing, and the façades applied to them another. They do not fit, nor in their essence belong to the anatomical or structural organism behind. Instead of growing therefrom with the rigour of logic, and expressing rhetorically—so to speak—but even transparently, the one fundamental law of architectural, as, indeed, of all organised being, we have an array of features imposing enough no doubt, and that in a double sense, but for which there is no *raison d'etre*, except pictorial quality. Picture making, however, is not architecture. It is akin to the loud fault of the Renaissance—the old foe under a new face.—I am, &c., JAMES HIBBERT.

Preston, May 11.

DRY CONSERVANCY v. WATER DRAINAGE.

SIR,—I have been attracted by the controversy going on in your columns on this subject, a controversy which to my mind only confirms the adage that truth does not lie in extremes. The original writer advocates too ardently the dry earth, the other is too much enamoured of water. In truth, either has its appropriate sphere. In the first place, then, your correspondent "B." rightly remarks on the confusion existing in the mind of the writer on dry conservancy as to drainage and irrigation, two things not necessarily connected. Still practically the two cannot now be dissociated in the minds of sanitarians. To the system of drainage with irrigation various objections are urged. First, and what strikes home to every man, is its expense; practically, however, the dry earth system does not, as "B." has well shown, obviate this objection, since all household refuse of a fluid nature has still to be carried away by drains. Nor is this all, for there are certain facts of which both writers seem ignorant, which still further necessitate a separate system of drainage. In practical working the success of the dry earth system depends on the separation of the solid from the fluid portions of human evacuations, for if these be not kept apart the quantity of earth required, and the frequent changes rendered necessary, nullify the advantages of the system. In barracks, where there are none but males, the separation may be secured by a transverse partition in the stool, as is done in India, but one can at a glance see that such a system is inadmissible for household purposes. So, again, in prisons, as at Wakefield, stringent rules may secure the use of the urinal with which each prisoner is supplied, but this cannot be expected in private life. These facts should never be forgotten.

Again, it is urged that the dry earth system is applicable to towns as well as to country places; that contractors would be glad to bring the earth and remove the filth. Practically this is not so. At Wakefield Prison, although lying almost in the open country, the authorities have to pay for the removal of the earthy compound, which, whatever may be said to the contrary, does, when accumulated in heaps, give out a very disagreeable odour.

Further, the advocates of dry conservancy tell us that irrigation entails such a waste of material, whilst they speak of earth as a perfect conservator of every useful substance; but what are they to do with urine, kitchen slops, and such like decomposable materials to which the system is not applicable? Are they to throw them directly into rivers, or are they to make use of a secondary system of irrigation? Again, most of the out-and-out advocates of the earth system ignore the fact that the compost of earth and filth is not applicable to all soils; that if mixed up with clay it constitutes a dense tenacious mass, barren, and almost incapable of cultivation. Also that the only kind of soil likely to be truly benefited by the compost is not adapted for the cultivation of those plants which take up most. Neither is irrigation adapted to all soils, but for that no one contends, whilst against phosphates irrigation is urged the fact that ryegrass suits irrigated lands as a crop better than anything else. If, however, I remember aright, there exists an account of a visit paid by a large number of the Leamington sanitarians to Stroud, where they found blooming fields of corn produced by sewage irrigation. But putting that aside it is no mean matter to have converted a sandy waste into land capable of producing thousands of tons of grass. Not satisfied with so maligning the system of irrigation, its opponents spread abroad a report that the grass thus grown taints the cow's milk. This, however, has been contradicted on incontrovertible authority. The advocates of irrigation might, therefore, well say to their opponents, show us equivalent results.

I now approach a somewhat difficult, and certainly a most important portion of my subject, the effects of the two systems on disease. The advocates of dry conservancy are extremely fond of throwing certain facts in the teeth of their opponents. They cite the case of the Tottenham epidemic of typhoid fever as a proof of the evils produced by irrigation. So, also, certain curious facts observed by Dr. Cloriston in the Carlisle Asylum are employed in the same way; but if you will allow me to trespass on your space with some observations important indeed to a true estimate of either system, yet rather alien to the nature of your paper, I shall try to be as brief as possible. It is now admitted that such maladies as typhoid fever and cholera are propagated by germs present in the evacuations of those ill of such diseases. Whether this is the sole mode of propagation is as yet unsettled. It is further admitted that such germs are by far the most dangerous, and the diseases by far the most prevalent, when they have found their way into drinking water. But, on the other hand, it has not been proved that this is the sole mode of propagating disease; on the contrary, certain facts would tend to show that cholera advances faster when dry winds prevail, indicating that cholera germs are most easily transmissible through the air. There is further the analogy of ague, which prevails most, not when a country is under water, but when it begins to be dried up. If this be the case, about which there is no rational doubt to those who are willing to be convinced, I greatly question if the dry earth system is the better of the two, for it has never been shown that if dry earth possesses the power of destroying smells, that it is also capable of destroying cholera and fever germs, which may thus lie dormant until washed by the rains into rivers or wells, the period during which such germs may survive being altogether unknown.

Let it never be forgotten, further, that the system advocated is not that of any kind of earth, but only of dry earth conservancy. If the above remarks be true—and we challenge anyone to dispute them,—the drying and pulverising of the earthy material would be the very thing to set the noxious particles at liberty. Again, the same fact must not be overlooked when advocating the applicability of the system to large towns. People talk of earth heaps in town, and heaps out of town; they forget our climate; we have not the prolonged droughts of India, which render the system so simple there. Most days in the year we have more or less rain, and to what a sweltering mass a good thunder shower followed by bright sunshine might give rise we shudder to think. It is all very well to show a specimen kept for years in a bottle—that is not the practical question.

That water drainage has evils we freely admit. Closets will get wrong, and then one is liable to an influx of gases, not from his own house alone, but from every other along the line of the sewer. No doubt fever may be propagated in this way. So, again, the basements of houses in low-lying neighbourhoods, as Pimlico in London, are liable at any time to be flooded with the most disgusting matters, but the dry earth system would neither do away with the smells nor with the floods, for a sufficient amount of refuse would be left to give rise to both. These facts its advocates ignore, as they do another—that with improved drainage disease has diminished. Even such an unlikely complaint as consumption has been shown to be lessened wherever a good system of drainage has been introduced.

But, on the other hand, the dry earth system has its merits. Those do it wrong who advocate

its introduction into large towns, with the increased traffic and the increased annoyance it entails. Its true sphere is in the country, among detached houses and small villages, where the horrid cesspool system is still rampant, for although some rabid advocates of dry conservancy uphold the superiority of these over even good drainage, the evils I have witnessed prevent my giving them one moment's heed. Should fever break out in one of these places, the havoc it produces is fearful. Witness the case of Terling; and invariably the worst cases occur in those houses situated near an accumulation of filth. Nor is the malignancy of such diseases only increased. Every malady appears in an exacerbated form in the persons of those living in such houses, and long subject to such depressing influences. The advocates of the dry system point to the change which has taken place in disease in recent times, and kindly attribute the lowered type to water drainage. The men are wilfully blind who talk so. They wilfully shut their eyes on facts like those I have already cited. In the country, then, where earth is readily procurable, and where closets are generally outside the dwelling, this system is likely to be most successful. Its universal adoption in large towns is to be sincerely deprecated. People may think they would thereby escape the expense of extensive drainage works; that has been shown to be a mistake. The evils now complained of in connection with our water systems are remediable. Let us take care that we do not introduce, in their stead, a system which may entail greater cost, and prove more inefficacious, than that we now possess. The present controversy is a most unfortunate one; large drainage works are at a standstill, and towns are left in their old, unwholesome state, until this dispute, which, by one party at least, is being conducted with more noise than judgment, shall have been settled. Let us hope it will be soon; but this can only be by either side partially giving way.—I am, &c., M. D.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

SIR,—By reference to your front page, it will be seen that a special meeting is convened for next Monday evening, to consider whether a present use can be made of the Orphan Asylum Fund towards relieving the distress caused by the death a short time since of one of our fellow workers, leaving a widow and large family comparatively destitute. I feel confident that I shall not appeal in vain to our friends to show their sympathy with suffering by their attendance, and I desire to draw attention to a few facts of which I am afraid some are ignorant. The committee have been empowered for some time past to grant temporary relief (vide Rule 5), but the necessity not having arisen, no use has been made of that power. I am afraid that when this fact becomes better known we shall not want for claimants, and therefore I would particularly press upon the attention of our kind friends (especially our brother clerks) the necessity of affording the Institution all the aid in their power either by donations, subscriptions, or recommendation, or better still by all three. Our funds are totally inadequate to be of any other than temporary avail, but the committee look with hopefulness to the future, in confidence that their past labours will not be lost.

I would also beg to acquaint our friends and supporters who have not yet been waited upon for their subscriptions that it is almost impossible for the committee to collect them personally and it will be esteemed a special favour if they will kindly forward them to the treasurer, Mr. Henry Sharp. I shall be very glad to forward copies of the rules and last annual report or supply information to anyone upon application.—I am, &c.,

F. F. MITCHELL, Secretary.

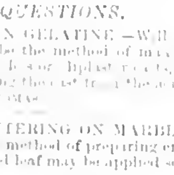
Intercommunication.

QUESTIONS.

[852.]—MOULDS IN GELATINE.—Will you, or some reader, kindly describe the method of making moulds in gelatine from living bodies or plaster casts, together with the method of clearing the cast from the acid of the gelatine mould?—H. THOMAS.

[853.]—GOLD LETTERING ON MARBLE.—I should like to know the best method of preparing engraved letters in marble so that gold leaf may be applied so as to endure.—A. A.

[854.]—RAMPING TWIST.—Will some correspondent be kind enough to furnish me with geometrical working lines for a ramping twist (as per sketch), also giving directions



how to work it?—(a abutment, c coping, 1⅝in. band.)—AN AMATEUR FOREMAN.

[855.]—DAMP BRICKWORK.—Can any of your readers inform me what is the best thing to be done on external bad brickwork, to prevent damp, and not discolour the work? I should prefer something in the way of a cheap wash, to be used with an ordinary whitewash brush. The bricks are very porous.—A. B. C. D.

[856.]—CORROSION OF LEAD PIPES.—It is a well-known fact that when iron and lead are brought into contact galvanic action takes place and the iron gradually decays. I have recently found that lead pipes embedded in the earth were so eaten away as to require renewal after a few years. I should like to know how to prevent this. It is quite evident that it is not the moisture in the earth, or, at all events, the inside of the pipe through which water was constantly passing was smooth and unimpaired. This is rather an important economical question, as thousands of tons of lead piping are being destroyed annually, and if anyone can suggest a remedy he will do a public service. —H. H.

[857.]—TO CLEANSE OLD STONEWORK.—Would any of your correspondents kindly inform me what I should apply to old stonework to cleanse it of coatings of whitewash and paint, and how it should be used? would potash suit the above?—T. H. A.

[858.]—SPECKS ON DRAWING PAPER.—Will you, or some of your readers, be kind enough to inform me, by means of your Intercommunication, the best method to lay on washes of colour on rough drawing paper, without leaving small specks of the paper uncovered?—W. T. F.

[859.]—CHURCH ARCHITECTURE.—Can anyone inform me of any book from which I could obtain information as to the probable origin of the various forms and treatment introduced into church architecture, and what those forms, &c., are emblematic or representative of?—A PUPIL.

[860.]—TWISTED WALL.—Would any of your readers favour me with the geometrical workings of a ramped and twisted wall? By so doing they would oblige—ASPIRANT.

[861.]—SCIENCE AND ART DEPARTMENT.—Mr. Editor,—Will you give me some information whereby I may endeavour to become qualified to enter (say as a clerk) in the Science and Art Department? I want to know what are the qualifications and duties.—ARTHUR.

[The limit of age for ordinary clerks to enter the department is from 18 to 30 years; and the course of examination for candidates includes writing and dictation, transcribing, arithmetic, geography, translation from one ancient or modern foreign language. The salary of ordinary clerks at South Kensington ranges from £100 to £150 annually. Of course, there are many other offices besides that of an ordinary clerk to be filled in this department in London. Let "Arthur" be more specific in his question, and we will endeavour to get for him a more specific answer.]

REPLIES.

[842.]—DRAIN TRAPS.—"A Town Surveyor" recommends in answer to my query that the traps should be kept outside the house, and I agree with him; such a course is desirable where practicable. His experience is, that in the majority of cases the position of the sink admits of such an arrangement. My experience, in London, is entirely different; in houses in confined localities, with underground kitchens, and in housemaid's sinks on the upper floors communicating with water closet soil pipes, a modification of the D trap would be a most useful contrivance.—J. KIRKBY.

[842.]—The most effective, cheap, and simple is the common 4 in. stone ware S trap, the same pattern as the lower part of Messrs. Doulton and Watts' closet, as shown in the BUILDING NEWS last week; no better can be made. Be particular to have the joints of the drain pipes made perfectly tight, as they pass through the wall; and if there be an old brick, or stone drain, put drain pipes in the place of it, or the sewer gases will be liable to pass up the cavities and escape in different parts of the house. Bring the top part of the trap to the level of the flags, so as to have easy access to it, and let the lower end be connected to the drain pipes with a bend or elbow. If there be a bell trap, cut the middle part out of it, dispense with the cup, solder the grate down, and a 1½in. pipe will do to connect the sink to the trap, and leave room to admit a small ladle to clean it when required without disturbing the pipe. I have had the above kind of traps in use for upwards of 12 years, and never had anything to do at them, or had any complaints of anything offensive from them. If there be a rain water tank under the floor it is as necessary to trap the overflow as the sink.—CONSTANT READER.

[842.]—A "Town Surveyor's" remarks last week were very useful. Too much attention can scarcely be paid to such a subject now the hot weather is coming on. At the last meeting of the Architectural Association, one of the speakers called attention to a new and simple drain pipe, recently introduced by Mr. Antill, of Merton road, Wandsworth. The arrangement most effectually prevents the escape of gas from the drain. Of course the adoption of that, or any other trap, will depend, to a great extent, on the price charged for it.—A. W.

[A short description of the trap referred to will be seen in another column.]

[847.]—WROUGHT IRON PLATE GIRDER.—We can supply plates ⅜in. thick and upwards, up to 4ft. 7in. wide and 8ft. 2in. long, maximum weight 6 cwt., at prices which we shall be happy to quote. We charge extras beyond these dimensions and weight.—RIDGWAY and BELLEROCHE, 20, Coleman-street, London.

[850.]—SELF-ACTING ASH CLOSET.—You can witness Moule's Patent Portable Earth Closet in daily operation at 29, Bedford-street, Strand. Ashes are not so good a deodorant as earth, and cannot well be used.—S. H.

[851.]—TAKING OUT QUANTITIES.—"A. J. L." will find the "Young Surveyor's Preceptor," by Mr. John Reid, published by Simpkin, Marshall, and Co., the best work on quantities; price 16s.—H. L. G.

[851.]—A work that will instruct how to take out quantities is always being inquired for in the BUILDING NEWS. Nothing but practical experience will teach this art, and oral instruction from a master of the method; but if it be only required to learn how to assist these instructions, "Hurst's Surveyor's Handbook" contains some very useful memoranda.—F. R.

[851.]—"A. J. L." will find "Hurst's Architectural Surveyor's Handbook" a great assistance in taking out quantities and generally measuring work, besides containing other useful information. The price is 4s. 6d.—T. H.

WAGES MOVEMENT.

A general strike of stonemasons has taken place at Oldham. The dispute relates to both questions of time and money. The masters are in hopes of being able to carry their point.

The operative painters of Bradford some weeks ago struck work for an advance of wages—from 5½d. to 6d. per hour. The masters resisted the application on the ground that it was unreasonable; and the men, who alleged that an implied acquiescence had been previously made, offered to submit the matter to arbitration, but their employers refused. The different masters have now obtained a supply of hands from London. The men who struck work have consequently started an industrial society (limited), with, it is said, great promise of success.

The turnout by the bricklayers of Stockport for an advance of wages has collapsed. The introduction of fresh hands from London and the midland districts has enabled the masters to resume business. Such of the dissentients as have been obstinate have lost their shops, and their places are now occupied by non-unionists. The contest is over, and the pickets have disappeared as intimidators of the imported bricklayers.

On Monday evening a meeting of operative painters was held at Wolverhampton to consider the desirability of placing the trade on a better footing than it now occupies in respect of the rest of the building trades. With little or no discussion it was resolved—"That we solicit the masters for the sum of 1s. advance, and a reduction of two hours of the Saturday." It was explained that the time at which it was desired work should cease on the Saturday was one o'clock, at which time wages were to be paid, either on the job or at the shop.

The masons of Wigan have struck work to enforce the rules of which they had given notice. The great point was a proposed reduction of six hours per week, and this the masters have determined to withstand.

The plumbers' strike at Edinburgh is ended. One by one, at the end of the first week, employers gave way, which led to a general yielding almost immediately. Plumbers' wages are therefore now 6d. per hour in Edinburgh and Leith.

STAINED GLASS.

The east window of St. Silas' Church, Lozells, consisting of three lancet lights, has been filled with stained glass. The subjects of the centre light are St. Silas preaching and SS. Silas and Paul delivered from the Philippian prison. The side lights are filled with two medallions, containing figures of the Evangelists—SS. Matthew and Mark in the dexter light, and SS. Luke and John in the sinister—with their respective emblems. The window accords in style with the early period of the architecture, viz., thirteenth century, and was executed by Messrs. Hardman and Co.

A memorial window has been designed by the Marquis of Bute, and presented to Buccleuch-street church, Edinburgh. The subject is taken from the 21st and 22nd chapter of the Book of Revelations, and represents a bride—typifying the New Jerusalem—adorned to meet her husband. The work was executed by Messrs. Ballantine and Son.

STATUES, MEMORIALS, ETC.

A handsome memorial tablet to the memory of the late Sir T. Noon Talfourd, who for many years represented the borough of Reading in Parliament, has just been placed in the new lodge room of the Philanthropic Society of that town, in which institution the distinguished judge took a great interest. It is on glass, beautifully enamelled, and is the gift of Messrs. Gladden, of Reading, two active supporters of the society.

Nearly £1,500 has been subscribed for the purpose of erecting a statue to the memory of the late Earl Rosse. The committee are about to communicate with Mr. Foley, the eminent sculptor. The statue is to be erected in Parsonstown.

BUILDING AND LAND SOCIETIES.

The sixteenth annual meeting of the Stoke Permanent Building Society was held recently, Mr. Geo. Turner in the chair. The report stated that the society was steadily progressing both in its operations and numerical strength, the present number of shares being 1,050, being an increase in the last two years of nearly 400. The profits made during the year enabled the committee to recommend a dividend of 1½ per cent. in addition to the 5 per cent. compound interest according to the tables. £5,627 had been advanced on good mortgage security. The accounts and report were adopted.

LEGAL INTELLIGENCE.

CAUTION TO BUILDERS.—On Thursday, John Norris, builder, was charged at the Maidstone Petty Sessions, with building three houses in Albert-street, Perryfields, contrary to the bye laws. Mr. Hoar, clerk to the local board, briefly indicated the nature of the evidence, and said that he thought the defendant's plans which he first sent in to the board had been rejected; he had not sent any others, but had gone on building. He then called the borough surveyor, who stated that the three houses in question

consisted of basement, ground floor, and first floor. He had measured the pitch of the various rooms, and the third bedroom on the first floor was 7ft. 3½in., the other rooms being of the regulated height, 8ft. He visited the building as many a dozen times while it was in the course of erection, but did not warn Mr. Norris that he was building contrary to the act, as till the roof was on he could not tell at what pitch the rooms on the first floor would be. If defendant had chosen to have had a sloped ceiling instead of a square one he would have come within the act. The chairman said the case was fully proved. It appeared to the bench to be a piece of obstinacy on the part of the defendant, as at a very trifling expense the room could have been made according to law. To mark their disapprobation of his wilfully disobeying the law, the defendant would be fined 40s. and costs.

MEETINGS FOR THE ENSUING WEEK.

MON.—Royal Institute of British Architects.—Paper on "The Foreign Artists Employed in England during the Sixteenth Century, and their Influence on British Art," by M. Digby Wyatt, F.R.I.B.A.

TUES.—Institute of Civil Engineers.—Discussion on "Engineering Philosophy." "The Durability of Materials," by Mr. E. Clark, M. Inst. C.E., 8.

WED.—Society of Arts.—"On the Condition of the Agricultural Labourer," by J. Bailey Denton, Esq.

Geological Society, 8

FRI.—Architectural Association.—"Modern Furniture," by C. L. Eastlake, Esq.

SAT.—Associated Arts Institute.—Paper on "The Qualities which Constitute the Artistic Mind." By James Barry, Esq.

Our Office Table.

In laying the keystone on a church at Coventry, on Tuesday, a ceremony which was conducted with full masonic honours, Lord Leigh said he held in his hand the mallet with which King Charles II. laid the first stone of St. Paul's, and which was, after the ceremony, presented by his Majesty to Sir Christopher Wren, by whom it was given to the Lodge of Antiquity, No. 2, in London.

On Thursday week Mr. H. Ottley, according to annual custom, delivered a discourse "On the Art Season," at the rooms of the Society for the Encouragement of the Fine Arts. The speaker made a rapid survey of the art history of the year, including all points of interest connected with public works, and the products of art as displayed at the exhibitions of the season and in the printsellers' windows. In the first-named branch of his subject he referred particularly to the late competitions for the Law Courts and the National Gallery, which had each resulted in a dead lock, and which had been so unsatisfactory that he hoped they would be thrown aside altogether, and the questions reopened anew. Speaking of the hundredth exhibition of the Royal Academy, now just opened, Mr. Ottley said that, whether considered as a whole, or in its parts, it did not warrant the repetition of the hackneyed description of newspaper critics, as being "fully up to the average of former years." On the contrary, he considered that it was an unprecedentedly bad exhibition, and one discreditable to the arts of the country. He did not think there was a picture in the whole range of it which the country would be prepared to put forward, whether at home or abroad, as fairly representing the status of our art. This was a sad reflection, and on this hundredth anniversary of the foundation of the Academy the question thrusts itself on the mind how far that institution would have to be held responsible for the result as it stood before them.

Dr. Whitmore, the medical officer for Marylebone, in his last monthly return, says the large number of 40 deaths from consumption and 40 deaths from bronchitis testify to the destroying effects of the cold easterly and north-easterly winds which prevailed during the past month, and ought to furnish a warning of the risk and danger incurred by persons who are accustomed in the early spring to throw off their ordinary winter clothing and adopt that which is only adapted to warm genial weather.

A soldiers' industrial exhibition was opened at Lucknow, in March last. The Government advanced 6,000 rs. for prizes.

The Art Exhibition in Bombay, on which we commented recently (BUILDING NEWS, No. 692), has proved successful. 12,570 people visited the exhibition during the three weeks it was open. The receipts amounted to 14,600 rs., and the expenses were a little over 7,000 rs. Mr. Ellis was the soul of the exhibition. He, however, found a zealous co-operator in the secretary, Mr. Griffiths.

The marvellous rise in real property in the metropolis of America is shown by the following:—The south corner of Broadway and Bond-street has been valued within a lifetime at 10 dols.; it was sold once for 250 dols., then offered for 500 dols., then for 2,800 dols., and in 1839 was again sold for 18,000 dols. Recently 200,000 dols. have been offered for it and declined.

The department of Greek and Roman antiquities in the British Museum appears to have been greatly enriched during the year. Amongst the contributions is a skull sculptured in marble, rather larger than nature, found in the ruins of one of the palaces of Tiberius at Capri. This skull, which appears to belong to the best period of the Greek art, seems to have been carefully modelled from nature, certain abnormal peculiarities of the original being exactly reproduced.

The publication of the "National Records of England and of Scotland" will probably be completed in the course of the present year. It is proposed then to publish the *fac similes* of "National Records of Ireland."

We are informed that the Government, with a view of constituting a separate department of science and art for Ireland, analogous in its constitution to the existing Science and Art Department in London, and of amalgamating, as far as possible, all existing institutions in Ireland receiving State grants for science or art, have appointed a Commission to report on the best means of carrying out this object.

Lord Kinnaird writes in the *Pall Mall Gazette* that he has received a letter from a working man expressing the wishes of a large body of his class in the east of London that the removal of the natural history collection from the British Museum should be prevented, as he says truly that by its removal the great attraction to the working classes would be destroyed. From their earliest youth the poorer classes delight in animals, and those within reach of the British Museum are often led by their examination of the different specimens of natural history there to visit other parts of the museum, and thus a general taste is created for the sciences or works of art.

The works connected with the viaduct across the valley of the Fleet are progressing favourably. The western section of the new street leading from Hatton-garden to Smithfield is completed and paved as far as Farringdon-road, and the eastern section from thence to the Dead Meat and Poultry Market is being advanced favourably. Another new street connecting that just alluded to is being formed, and will run parallel to Farringdon-road, into Farringdon-street, passing beneath the viaduct on the Holborn side; the carriage-way of this is being macadamised and the footway paved. The portion of the viaduct at the top of Holborn-hill is being paved and brought to a level with Holborn, and active preparations are in progress to connect the eastern and western sections of the viaduct by ponderous iron girders at the north end of Farringdon-street.

The notorious "Jack Flint" has been liberated from Bedford gaol after twelve months' imprisonment for the manufacture and sale of spurious arrow heads. The local papers caution the public against him. We confess, says the *Pall Mall Gazette*, that when we daily see auctions carried on at which sham ancient pictures, sham old china, sham curios of all kinds, and sham old wines, are openly disposed of at fancy prices, we cannot help asking ourselves why poor Flint Jack has been incarcerated for a year in Bedford gaol. There is at present at Birmingham a manufacture of bronze phalli, which are exported in considerable numbers to be retailed to collectors who visit the environs of Naples; and nobody thinks of sending the person who manufactures them to gaol under Lord Campbell's or under any other Act of Parliament.

Mr. Headlam's committee of the House of Commons has determined to report in favour of a new chamber to be erected in the Commons Court, according to a plan suggested by Mr. E. M. Barry, A.R.A. The committee came to this decision after a careful consideration of the plans of foreign Houses of Assembly, and of various modes of enlarging the present House suggested by members of the committee and others. The new House is to contain 569 members, and with new division lobbies and other necessary adjuncts is estimated to cost £120,000. The present House is to be restored to its original appearance as designed by Sir Charles Barry, and is to be retained as the entrance lobby to the new House. It will be available for use as at present while the new House is in course of erection.

We learn from the annual report of the Architects' Benevolent Society, just published, that the financial depression generally felt during the past year has affected the funds of the society. Many great works have been postponed or abandoned, and a number of private undertakings have been checked; and the demands on the society have increased. The report says the funds of the society are alike available for administering relief to those overcome by sickness or distress, who have pursued their professional labours either in London or the provinces, the sole object being that of alleviating the sad consequences of those reverses to which all are liable. During the past year a great many new members have been added to the list from Manchester, and it is earnestly hoped that other towns will follow the example thus presented.

The Royal Commission, consisting of Sir W. T. Denison (Chief Commissioner), E. Frankland, Esq., and J. C. Morton, Esq., will shortly hold a preliminary meeting at the offices of the late "Rivers Pollution Commission," 2, Victoria-street, Westminster, to settle their course of proceeding. It is understood that the rivers in the north of England will be the first subject of inquiry before the Commissioners.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

2853 R. GEORGE. IMPROVEMENTS IN APPARATUS FOR WARMING AND VENTILATING APARTMENTS OR BUILDINGS. Dated October 11, 1867.

This invention consists in forming a portable heating and ventilating apparatus with a chamber of thin sheet iron enclosing a grate or fireplace, the chamber being of such dimensions that the products of combustion will circulate within it for a sufficient time to part with a large proportion of their heat, and in arranging within such chamber a pipe or other contrivance of thin sheet iron through which a current of air passes from the exterior to the interior of the chamber or building to be warmed or ventilated, and, further, in so arranging the chamber or case and the pipe or contrivance through which the air is admitted that the burning fuel does not come in contact with them, but only the heated products of combustion arising from the combustion of such fuel, substantially as described.—Patent completed.

2880 J. C. PEARCE. IMPROVEMENTS IN FIREGRATES AND FURNACES. Dated October 14, 1867.

Here the grate bars are connected together alternately so as to form two or more lots, which, by way of distinction, are termed lifting bars and traversing bars; the former work up and down edgwise, and the latter backward and forward lengthwise. In a convenient situation, about the front of the furnace, is fixed a revolving shaft provided with cranks or eccentrics, from which the required motions are communicated through suitable rods and levers to the grate bars. A hopper or other receptacle for the fuel is formed at the front of the grate, above the bars, and is fitted with an adjustable plate for regulating or stopping the supply of fuel to the furnace.—Patent abandoned.

2991 H. ADCOCK. IMPROVEMENTS IN KILNS FOR BURNING PIPES, TILES, BRICKS, POTS, AND EARTHENWARE. Dated October 24, 1867.

The patentee claims economising the heat in kilns for burning pipes, tiles, bricks, and earthenware articles, by causing the waste heat from one kiln to pass into a second, and thence to a third or more kilns, as and for the purposes set forth.—Patent completed.

2933 F. W. WADE. IMPROVEMENTS IN THE INTERNAL DECORATIONS OF DWELLING HOUSES AND PUBLIC BUILDINGS, AND IN THE MODE OF MANUFACTURING AND FIXING THE SAME. Dated October 19, 1867.

This invention consists in making such decorations either wholly or partly of cast iron, thereby facilitating the fitting up of the same, and affording great scope for elaborate and durable ornamentation at a small expense. In making these decorations the patterns are made in one or more parts, and of any convenient length, and the castings are nailed or secured to the walls or ceilings, or to both. The improvements in making ceiling centres

[illegible] in re-lating [illegible] ... external [illegible]

[illegible] J. TT[illegible] IMPROVEMENTS IN [illegible] ... Dated October 1[illegible]

[illegible] the following manner:— [illegible] of steel, ... even, the inventor [illegible] ... metal of a sufficient [illegible] ... have to clear, and [illegible] ... He cuts in the iron plate [illegible] ... of the stairs, [illegible] ... is not made usually [illegible] ... the length of the slope of steel [illegible] ... iron plate, turned end to [illegible] ... screw [illegible] in the inside with [illegible] ... He then bends the [illegible] ... for the [illegible] of stairs. Each angle in the [illegible] ... deeper than would be [illegible] ... the back or heel of the [illegible] ... He cuts in each [illegible] ... at the heel of the tread [illegible] ... to which the [illegible] ... suitable metal, and [illegible] ... can [illegible] ... He makes [illegible] of the [illegible] ... the string board, [illegible] ... and supports, and [illegible] ... the flight of stairs, [illegible] ... These pieces serve in putting up [illegible] ... he cuts at the end next the wall a little depth into the length of the [illegible] which he makes rather longer than the width of the [illegible] ... one part forward and the [illegible] ... a cramp or fastening in the wall, the [illegible] ... to each step, and, in case of fire preventing the fall of the staircase. He fixes the [illegible] to the iron plate of the string board instead of [illegible] the tread. To carry the plastering underneath the stairs he proceeds in the same manner as in other stairs, except that, instead of laths of wood, he fixes to the risers small pieces of iron [illegible] from the string board, which are riveted to and project below the tread, and carry strong iron wires longitudinally for the support of the plaster.—Patent abandoned.

2[illegible] J. CUBITT. THE PRESERVATION FROM DECAY OF STONE, METAL, OR OTHER SUBSTANCES, AND FOR [illegible] SO AS TO [illegible] SMOKE OR DIRT FROM ADHERING TO THEM. Dated [illegible] 1867.

Here the inventor applies to the surface to be preserved or hardened a liquid composition which has the property of hardening on the application of heat, and he afterwards heats the surface so prepared by means of a blast or current of hot air, vapour, gas, or flame forcibly impelled against it, or by means of a jet of superheated steam. The ingredients of the liquid composition or glaze will vary according to the nature of the substance to which it is to be applied. A composition of two parts of alumina, two parts of hydrofluoric acid, and one of caustic potash, afterwards rubbed up with ten parts of saturated solution of silicate of soda or potash, forms a good glazing liquid for several kinds of stone and brick.—Patent abandoned.

2[illegible] J. WHITE. IMPROVEMENTS IN MEANS FOR VENTILATING BUILDINGS AND OTHER PLACES. Dated October 22, 1867.

This invention relates to means for withdrawing vitiated air from a room or enclosed space. For this purpose the patentee forms apertures in the ceiling of the room or enclosed space, and he employs suitable channels or passages communicating therewith, and with a chamber connected with the grate or fireplace employed to warm such room or enclosed space, and from such chamber a pipe or channel is carried a short distance up the flue. Thus, by the heat generated by the grate or fireplace in the chamber connected therewith, the air contained in such chamber is rarefied, and in passing off by the flue such rarefied air carries away with it the vitiated air from the room or enclosed space. The vitiated air passes through the apertures in the ceiling and by the channel or passages into the chamber connected with the grate or fireplace, and out thereof through the pipe into the flue.—Patent completed.

2[illegible] R. WEARE. IMPROVEMENTS IN, AND IN APPARATUS FOR, [illegible] FOR THE RECEPTION OF URINE [illegible] MATTER. Dated October 23, 1867.

Here the patentee employs for the reception and treatment of urine and fecal matter a vessel, by preference of cylindrical form, closed at the top and bottom. Within this vessel is an inner lining; it may be conveniently of perforated zinc; the sides of the vessel are thus double, and the space enclosed is packed full of powdered charcoal and dry earth, or other deodorising powder. The soil pipe from the ordinary closet pan is connected with the top of the vessel, so that the urine and fecal matter from the pan are discharged into the interior of the vessel. The more fluid matters then filter through the deodorising material into channels which are formed for it against the outer sides of the vessel, and which are perforated, and these channels lead the fluid matters to a small pipe connected with the bottom of the vessel, and with a drain.—Patent completed.

[illegible]2 L. STOCKMAN. IMPROVEMENTS IN THE CONSTRUCTION OF ROLLERS FOR WINDOW BLINDS. Dated October 25, 1867.

Here the patentee divides the roller through about the central line thereof into two parts longitudinally (except that he does not usually divide its extreme end), and he has one half solid and the other slightly hollowed out (except as aforesaid). These parts he connects together by hinges or joints so that action similar to that of a box and lid is obtained. Into the now hollowed part of the roller he fixes a convenient number of small tenter hooks or catches, whereby the upper edge of the blind is to be secured to the roller, and to facilitate the attachment of the blind he prefers to provide the same with eyelet holes corresponding to the said tenter hooks, pins, or catches, and when the blind is secured the two parts of the roller are to be closed together, and then the blind will be tightly held between them, and the two parts are firmly kept in connection by a pin, bolt, lock, or hook and eye, or other suitable fastener.—Patent completed.

Trade News.

TENDERS.

BRIXTON.—For the erection of Mostyn-road Wesleyan Church, Brixton. John Tarring, architect, 6[illegible], Basinghall-street, E.C.:—

D. H. AND J. NEWALL,

GRANITE WORKS, DALBEATTIE, near DUMFRIES.

LONDON AGENT—MR. JOSEPH HARTLEY, Oakville, Maple-road, Anerley, S.E

DALBEATTIE GRANITE

(Specified for Thames Embankment).

Extracts from the Minutes of the Metropolitan Board of Works:—

"This granite is clean, clear, and regular in its pile, and has a bright appearance, which is more cheerful than, and preferable to, Aberdeen Granite."—J. W. BAZALGETTE, Esq., C.E., Chief Engineer to the Metropolitan Board of Works.

"In my opinion no better sample of granite can be found."—ROBERT RAWLINSON, Esq., Government Engineer.

"The best of all tests, the experience of a quarter of a century (in the Mersey Docks), has proved it to be the very best and most durable quality."—Extract from report by GEORGE FOSBEY LYSTER, Esq., Engineer to the Mersey Dock Estate.

MESSRS. SHEARER, SMITH, and CO., Lessees of the Dalbeattle Granite Quarries, are prepared to execute Contracts for any quantity of their well-known Granite, dressed or scabbelled, for Engineering, Architectural, Monumental, and other Works; also Setts and Curbing. Sea or Rail, to any part of the United Kingdom.

DALBEATTIE, N.B., and 21, Great George-street, Westminster, S.W

STONE QUARRIES.

KETTON, RUTLAND.

T. TURNER,

EMPINGHAM, NEAR STAMFORD

Has at all times a quantity of KETTON STONE in blocks, sawn and Worked to Order.

Ketton stone, turned balusters, bases, and columns, turned up to 5 cwt. each in the above stone.

Prices known on application.

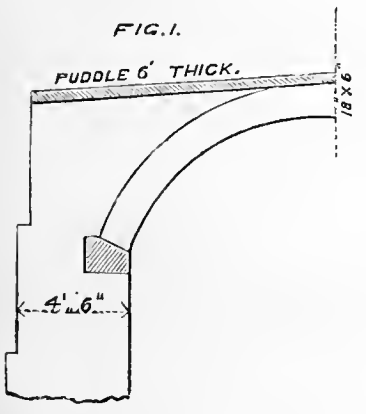
THE BUILDING NEWS.

LONDON, FRIDAY, MAY 22, 1868.

USE OF ASPHALTE IN CONSTRUCTION.—I.

PREVIOUSLY to the introduction of asphalte with its numerous bituminous compounds, puddle was the principal material relied upon for protecting from damp the extrados of arches, the backs of retaining walls, and for forming in general a watertight covering, or impervious layer, over all those parts of a structure whose stability might be endangered by the admission of wet. Puddle, which is still used in the making of embankments, dams, and reservoirs, consists of any good stiff description of clay, free from all stones or foreign substances, and the great secret of its manufacture lies in the thorough amalgamation and complete incorporation of its whole mass. Unless the whole be well worked up and kneaded together in layers of a specified minimum thickness, puddle is of no more value as a watertight material than the most porous substance in existence. Probably one of the earliest applications of puddle, omitting the consideration of it in the cases of the centre of embankments, was to the extrados of arches, and it is in this instance that asphalte has very nearly entirely superseded it. In fig. 1 let a section of a semi arch be represented

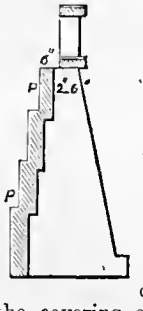
FIG. 1.



with a portion of its supporting abutment, and covered with a layer of puddle 6in. in thickness in the ordinary manner. We have known less than 6in. in depth to be laid on, but that dimension should never be reduced, being the smallest that is consistent with good practice, and which can be relied upon for forming a watertight covering. Partly from bad quality, and partly from imperfect mixing combined with an insufficient quantity, it arises that arches covered with puddle are continually leaking. It is, in fact, well known that to make an arch thoroughly watertight is not by any means a contemptible piece of professional skill, insignificant as it may appear, and only those who, like ourselves, have had to rip open the roadway over arches to repair and make good the puddle know what a troublesome and unsatisfactory job it is to accomplish. Asphalte, or asphaltum as it may be more correctly termed, was employed upon a large scale to replace the use of puddle upon the arches and tunnels of the Metropolitan Railway. Its application is very simple, and much quicker than that of its predecessor, It is heated upon the spot, payed over the arch in a semi-liquid condition, and then covered with a layer of fine dry sand. In addition to the comparative rapidity of the operation the thickness, instead of being 6in., can be safely reduced to 2in., thus effecting a saving of 4in. in depth over the crown of the arch. This reduction of depth, slight as it appears, is of great importance in metropolitan and suburban lines, where the engineer is sure to be pinched for headway in the majority of his bridges, whether over or under the railway. A coating of asphalte uniformly and evenly laid on over an arch may be considered to be completely impervious to water, and to be more efficacious than the best-made puddle.

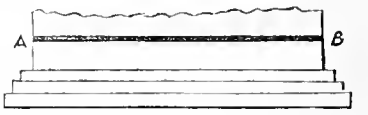
Before proceeding to describe the other applications of this useful and convenient aid to construction, a few remarks upon its nature and composition will not be out of place. Asphalte is one of the four recognised varieties of bitumen, the composition of which is not accurately determined. Judging, however, from the circumstance that its elements are carbon, hydrogen, and oxygen, its origin would appear to be of a vegetable character. It is usually associated with fragments of a calcareous nature, which are separated by boiling, and a mineral pitch is thus obtained, which melts at that temperature and burns with great facility. Bitumen was employed ages ago in the preparation of an extremely hard and durable cement, supposed to have been used at the building of the Tower of Babel. It also enters largely into the composition of the varnish covering the tea chests imported from Japan and other countries supplying us with that indispensable leaf. The principal localities where this substance is found native are the Dead Sea; the island of Trinidad in the West Indies, celebrated for its pitch lake; the northern department of Aniches, Ain, and the provinces of the lower Rhine. The theory of the formation of asphalte found in several parts of Switzerland, particularly in the Val-de-Travers, may be briefly summed up as follows. Regarding it as a calcareous deposit associated with pure bitumen, its origin is due to the decomposition of banks of molluscs, situated in a deep sea, and effected under the powerful influence of enormous pressure combined with a high degree of temperature. The pressure is caused by the great depth of water under which the formation takes place, and this explains the difference between asphalte and pure bitumen. The latter is similarly produced by the decomposition of molluscs or crustacea, but only in shallow water, and consequently there is not a sufficient amount of pressure to force it to become incorporated with the calcareous particles of the oyster and other shells in its vicinity. It appears, therefore, that both a high temperature and great pressure are necessary to the formation of asphalte or calcareous bitumen, and it will now be perceived that the former is necessary to the production of pure bitumen. When this latter influence is wanting, although the pressure may be considerable and the other conditions similar, yet bitumen will not be formed, but petroleum, which may be regarded as one of its varieties, as a sort of imperfect or crude bitumen. We have now to account for the appearance of calcareous banks due to the accumulation of oyster fossil remains, but containing neither bitumen nor petroleum. The most rational explanation is that they were produced under a temperature sufficiently high to evaporate the more volatile constituents represented by the above substances. In contradistinction to this animal origin of bitumen there is also what are termed the fixed bitumens, produced by the decomposition of plants alone.

FIG. 2.



Another usual application of puddle is to the backs of retaining walls, the wing walls of bridges, and similarly situated buildings. A section through a wing wall, with parapet, is represented in fig. 2, showing the method of placing the puddle P at the back, care being taken to secure it well at those places where the steps or offsets occur. Both with respect to the covering of an arch and puddling the backs of retaining walls, it is not merely the question of a watertight layer, but the stability and durability of the masonry or brickwork are also intimately concerned. There is no danger incurred in allowing the mere presence of water at the back of a wall similar to that represented in fig. 2, provided it is not permitted to accumulate or to lodge there. So long as it can find a ready and rapid means of access down to the drainage provided in all such instances, it produces no injurious effect upon the structure, but flows off innocuously. Many engineers, in lieu of puddle at the backs of retaining walls, place what is termed "dry lining," which consists of broken stones, or small metalling, packed loosely together, constituting a porous stratum for the water to pass through, should it penetrate to the back of the wall. It is easily perceivable that asphalte would have to be applied in a somewhat special manner to form a good watertight coating upon a vertical surface, and care would have to be taken that the layer was uniformly distributed. In instances of damp walls its use is frequently resorted to, but in many cases fruitlessly so, as the evil has taken too deep a root to be eradicated. One of the most valuable applications which can be made of asphalte is in the foundations of buildings, as a preservative against damp. The common practice has been, and is still, to lay a course of slates a little above the footing course, as represented in fig. 3. This precaution answers perfectly

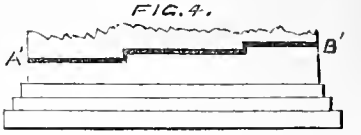
FIG. 3.



well so long as no settlement takes place, but unfortunately there is scarcely an instance upon record of any extensive building where the foundations have not settled to some extent.

We shall now contrast the different behaviour of slate and asphalte under these adverse circumstances. The former splits across directly any settlement occurs, as shown in fig. 4, and the damp, therefore, has

FIG. 4.



every facility afforded to it for rising in the wall, which can be at once perceived by the mortar becoming slightly moistened. The asphalte, on the contrary, owing to its flexible nature, bends with the settlement, adapts itself to the sudden irregularity, and preserves its watertight continuity unimpaired. We should not hesitate in all cases to prefer asphalte in a layer of three-quarters of an inch in thickness to a course of slates in a similar situation, and judging from the numerous instances we have witnessed of its application in this form, it is daily increasing in favour with those interested in building matters. Asphalte is largely employed in footpaths, and also in the formation of the roadway over bridges; but a good deal of care and judgment must be exercised in so using it. There are generally two methods of applying it to footpaths. One consists in actually mixing it with gravel and sand, and applying it *in situ*; and the other in first preparing it, pulverising it, then mixing it with a fifth part of its weight of melted bitumen, and running it in moulds. The cakes or slabs so produced are then laid down in the same manner as flags. This is a favourite method in France. We must reserve for another article the description of the manner in which this useful substance is applied to footpaths and the superstructure of bridges.

THE LIGHTING OF THE NEW ROYAL ACADEMY.

In the new Royal Academy we may expect a suite of rooms and galleries more favourably designed for the exhibition of fine art than those of any other similar institution; and inasmuch as the augmentation of space, as compared with that in Trafalgar-square, will be very considerable, it may be hoped that really meritorious "outsiders" will be spared the heartburnings they have so frequently suffered by the rejection of their works from want of room. The whole of the upper floor will be lighted from the top, with the exception of the sculpture room, and why this room should have been selected for a different treatment it is difficult to understand. With respect to the amount of wall space which may here be assumed as available, it is useless to refer to it in comparison with the rooms in Trafalgar-square, and worse than useless to speak of any of the continental museums, as none of the famous old "galleries" have been built especially for the display of pictures. In the erection of a gallery for fine art the first consideration is light, and this great end must be held in remembrance insomuch as to secure an equal distribution on each set of four walls throughout the building. This principle seems to have been kept steadily in view in the designs for the new Royal Academy.

The building has been in progress now somewhat more than twelve months. Bricks were first laid on May 1 last year, and the rapidity with which the pile has grown up supplies a comment on the pressure of the times in which we live. The academic body is sanguine of celebrating its centenary in its new home, and when we look back and consider the retrospect in relation with the prospect the proposal does not seem extravagant. It has long been settled that for an exhibition room in which all the wall space must be made available, there is no satisfactory means of lighting save by opening the roof. In order, however, to test the sufficiency of the plan in this case, one of the rooms was glazed, and its walls were hung with pictures; and thus, upon the *ex uno* principle, it was predicated of the whole that the effect would be unexceptionable. Many important points were determined only during the progress of erection, and others are yet in abeyance. It is at present understood that the glass coverings to all the rooms will be in the form of a lantern skylight. But to this arrangement the central octagon and the sculpture room will be exceptions, as the former will be lighted by a glass dome, and the latter by a large north window. It is intended that the opening in the roof of each room shall extend to within 6ft. of the wall all round. In rooms of low pitch wherein the upper walls would not be too high for the display of fine art, it would be found that under a vaulting extending 6ft. from the wall, the upper parts of pictures placed high would be obscured. But these rooms are sufficiently lofty to render it unnecessary to raise works within the shade of the vaulting.

For water-colour works there will be provided a long room or gallery, wherein will be distributed drawings in water colours and chalks, and perhaps miniatures, though the latter branch of art is all but extinct. There will be a room set apart for architecture; but, as the best water-colour subject drawings will not be offered to the Academy, the wisdom of competition with the water-colour societies is at best questionable.

On the part of the sculpture committee there seems to have been an objection to light their department from the top; consequently the sculpture room, which occupies the centre of the north front, is lighted by a large window. It can scarcely, however, be believed that the roofing of this room will be permanent; and for the expression of such a conjecture our reasons are threefold. In the first place, there is among the members of the Academy a feeling favourable to a top light. Again, in a room destined for the display of sculpture, and necessarily limited, there should be no preference of place; as regards light every part of the room should be equally lighted with the rest, which, by means of one side light, is impossible. Again, the central octagon with its glass dome is also intended for the reception of sculpture, and the even suffusion of the light in that part of the edifice will present a contrast to the partial lighting of the other room so unfavourable as to suggest reminiscences of the cellar in Trafalgar-square. According to a trite maxim, sculpture should be seen by such a light as shall show it with that proportion of firm marking and shade which should characterise a well-balanced drawing. This effect is procurable rather by an oblique than a vertical light, and, according to such arrangements, the central groups only will be seen by direct light, while the great proportion of the works will be seen by reflection; and hence there will be no improvement on the present sculpture room in Trafalgar-square.

Thus, the main consideration is, whether the Academy shall exhibit its sculpture in such a manner as to leave no cause of complaint on the score of undue preferences; or continue an arrangement which has been the source of infinite dissatisfaction. If there be any valid objections to the exhibition of sculpture by a vertical light they have been overruled in the case of the central octagon; and they should, we think, yield to the voice of the public, which has become fastidiously critical on the merits and demerits of a question in continual ventilation during that period of London life called the season. It cannot be regarded as a fortunate condition that the stately hospitalities of the Academy should necessitate the construction of a grand saloon. But so it is, and the precedent is absolute. There will consequently be a central room sufficiently ample for the entertainment of the very distinguished circle that the Academicians bid to their banquet annually. The large room has always been, and ever will be, the *cour d'honneur* of the Academy, and although members may point to certain of their own works in the smaller rooms still the gems of the collection are generally collected in the large room, and outside contributors consider themselves in some degree slighted on finding their works in the smaller rooms. The remedy for this grievance would have been the abolition of the state room, and such a disposition as would have placed the entire suite on terms of equality.

As in the present building the schools are held in some of the principal rooms, study is suspended during the time of the exhibition. In the new building the necessity for such suspension will be obviated by the allotment of the lower rooms of the north front to the antique school and those of sculpture and painting. But on this side the London University will obstruct the light so greatly as to render necessary the construction of a lean-to running the entire length of the front, by means of which a considerable portion of the interior will be lighted at an angle of 45 deg. To the second school of painting it is proposed to appropriate the south-eastern angle of the building. In an enterprise so important, and especially on a site so valuable as that of Burlington Gardens, some drawbacks must be expected. Thus the arrangements for the schools are not so satisfactory as could have been desired. These, however, could only have been altered by devoting a portion of the upper floor to the students, which would have very seriously encroached upon the space for exhibition. It would appear, therefore, that even sacrifices have been made in order to secure every available foot of space for exhibition, and this, after all, is the spirit in which the design for such an institution should be conceived.

WINDOW LIGHTS.*

SECOND NOTICE.

Some surveyors and builders seem to labour under the impression that one may carry foundations and footings over the strict boundary line of another man's land. We believe some former building acts did, under special circumstances, permit such an encroachment, but the conditions fixed and registered the ownership of the land. You must not now so build. A man's land is his, and all that is over it up to the stars, and all that is under it down to the centre of gravity, with the exception of mineral rights, which are always reserved. Suppose you drove a cellar bay under a man's garden, that would be adding to the size and convenience of your house at your neighbour's prospective expense. But suppose, on the other hand, that, without a knowledge of what you had done, your neighbour wanted hereafter to build also. What do you think would be the result when he opened his trench and found your brickworks there? Why, he need not even ask you to take them away, but peg along and confiscate them as he went on! In addition to this an action for trespass and special damage could be maintained, because you had no more business to interfere with another man's land *under* the surface than over it. We will now resume the original thread of our notice.

The enjoyment of light and air by uninterruption through occupancy time out of mind, formerly established a right by "prescription," and this law was based upon decisions that went beyond the time of "legal" memory, which is a good deal farther back than even that of "the oldest inhabitant." We have often heard persons ask what is "legal memory?" Legal memory, which is so often quoted, may be taken to be any decision or proceedings that can be found in any authenticated legal records. Thus, from an act passed in the reign of one of our Anglo-Saxon kings, Edward the Elder, between the years 900 and 925, came by inference the commencement of the "legal memory," which was ultimately settled to begin in the early part of the reign of Richard I. (1189), "whereunto the memory of man runneth not to the contrary." Mr. Latham has hunted up a case that was tried in the latter part of Elizabeth's reign, and is very interesting. In the thirty-first year of her rule an action was brought respecting the obstruction of light, and a verdict was obtained for the plaintiff. The defendant thereupon moved an arrest of judgment, and a reversal of the verdict, on the ground that the light was not an ancient light within the legal meaning of that term, as the house had been in existence no longer than the time of Mary, the previous sovereign. The house was held to be a recent erection, although more than thirty years old, and the window was consequently held not to be an ancient window, "time out of mind."

To show how closely the law had been followed through many centuries, and that, too, in the long desert-time of both foreign and intestine, political and religious wars, all the judges agreed—"That if two men be owners of two parcels of land adjoining, and one of them doth build a house upon his land, and makes windows and lights looking into the other's lands, and this house and the lights have continued by the space of thirty or forty years, yet the other may upon his own land and soil lawfully erect a house or other thing against the said lights and windows, and the other can have no action, for it was his folly to build his house so near to the other's land, and it was judged accordingly." The harsh operation of this rule produced in 1623 the Statute of Limitations, 21st James I., enacting "that no person

* "A Treatise on the Law of Window Lights." By F. L. Latham, Esq., of the Inner Temple, Barrister at Law. London: Butterworths, Temple Bar, Publishers to the Queen's Most Excellent Majesty.

who has any right or title of entry shall enter but within twenty years next after his right or title shall accrue." This was the first of the twenty years' undisturbed possession law, and, as usual, was twisted and turned into all sorts of shapes but its own, until it gave rise to a great many popular legal errors, some of which have survived to the present day. With the right of the soil went the right of everything belonging to it, and called forth the dictum of a Lord Chief Justice in times gone by—"If my possession of the house cannot be disturbed, shall I be disturbed in my light?"

The judges of more modern times had now something tangible to deal with, and the twenty years' enjoyment of undisturbed window lights came to be an authority at Equity and Common Law, as, theoretically, an agreement between the person using the light and the person over whose land it came. This presumption had not as yet received the stamp of absolute law; that was to come, as settled constitutions are of slow growth. About a century ago Lord Mansfield disturbed the minds of builders and building people, and set the question seething again by a summing up which he gave in an important case then before the court. He said:—"The enjoyment of lights with the defendant's acquiescence for twenty years is such decisive presumption of a right by grant or otherwise that, unless contradicted or explained, the jury ought to believe it; but it is impossible that length of time can be said to be an absolute bar, like a statute of limitation; it is certainly a presumptive bar, which ought to go to a jury. Time immemorial itself is only presumptive evidence."

So troublesome and full of litigation had the question of "time immemorial" attained to in actions of this kind that, on August 1, 1832, the 2nd and 3rd Will. IV., c. 71, commonly known as the Prescription Act, became law. This Act was not for window lights alone, but for every kind of right in which "time immemorial" was the basis upon which such right rested. Juries were to be no longer called upon to settle what "time immemorial" was, for the Act settled all that. Section 3 says:—"When the access and use of light to and for any dwelling-house, workshop, or other building shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible, any local usage or custom to the contrary notwithstanding, unless it shall appear that the same was enjoyed by some consent or agreement expressly made or given for that purpose by deed or writing." It must also be borne in mind that when an ancient light is interrupted, the interruption must not be acquiesced in for more than one year, otherwise the right is lost. But here is another point in this law. Suppose a man has enjoyed the use of light and air for a period of nineteen years and a fraction of the twentieth year, however small, and that, during the remainder of the twentieth year, the adjoining owner builds up and shuts out the light, the twenty years' enjoyment not having been completed. The House of Lords has held that the claim of light would be good against the world, because the Act specifies that the obstruction must be for one whole year, and that any portion of a year, however large, will not defeat the claim. Furthermore, no amount of interruption at any time during the twenty years' user will defeat the right unless such interruption has been acquiesced in for one whole year. These terms are set forth in section 4 of the Act.

Before the passing of the Prescription Act there was "the custom of the city of London," by which any citizen could pull down his house and rebuild it as high as he chose, without reference to the air and light of his neighbours. And even now actions are being continually commenced against persons rebuilding who will still persist in the validity of the custom. Of course an interview with a solicitor soon brings matters to an understanding more in accordance with the law. It has happened that for the first time for four hundred years the Recorder of the City of London has appeared in full official robes at the bar of the (then) King's Bench to declare *ore tenus* "from the mouth," the custom of the city with respect to buildings. The previous appearance of such an officer there on such an occasion was in the reign of Henry VI., about the middle of the fifteenth century. A number of cases have been tried with the view of forcing the city out of the Prescription Act, but they have all been unconditionally defeated. Actions have been brought for the obstruction of wind to the sails of a windmill and of air to a timber yard, but they have not been maintained.

Of the acquisition of right by express agreement, Mr. Latham gives us much detail, from which we gather that the subject belongs more to the quality of "easements" than what is before us. We are also cautioned, by a number of cited cases, not to look on unheedingly and allow anyone to expend money upon anything near our land that may damnify us, and then prevent them using what they have thus made. Whenever a trespass or an obstruction is commenced, notice of discontent should be immediately given, and proceedings served. Lord Eldon, in his day, repeatedly refused the protection of the Court of Chancery to persons who applied for it because they acquiesced silently in the construction of what was to produce the trespass. For instance, a man may build a house or workshop on a site, the way to which may be only along a footpath through an adjoining owner's land. If that owner were to stand by and allow money to be laid out without inquiring what the building was intended for, and stating his refusal to permit a road over his land other than the established footway, the Court of Chancery would not help him. Cases are mentioned in which the owner of the adjoining land has allowed matters silently to be completed, and has then put a "stopper" on by refusing a roadway, but the Court has compelled him to allow it in consequence of his own conduct.

A landlord let certain premises on lease with all their ancient lights, in consideration that certain improvements were to be carried out, the opening of new windows being among them. He then bethought him how to turn the "nimble penny," and let an adjoining piece of land to another person to build on, but kept back the fact about the condition of the lease of the neighbouring premises. The second tenant began to build and block up the newly-made windows of the first. A recourse was had to the court, and the sharp landlord was most unpleasantly brought to his senses. The walls of the second tenant had to be pulled down, and the landlord had to settle with him.

With respect to ascertaining the nature of an injury by the stoppage or obstruction of lights, the Court of Chancery have accepted certain dimensions. If a street be 40ft. wide, and the house be 40ft. high, and it is intended to rebuild it to the height of 50ft., then the extra 10ft. must be sloped back so as not to obstruct the light any more than if the street was 50ft. wide. Whatever the height of the house is it must be in the same proportion as the width or an assumed width of the street. In any other arrangement of the question out of court it must be one of compensation. With respect to windows, a mode of estimation has also been fixed. The sky area of a vertical window is 180 deg. horizontally by 90 deg. vertically. That of a horizontal skylight is 180 deg. in every direction, whilst "that of a sloping window is 180 deg. in the direction to which it faces, and vertically the same number of degrees as are contained by its own angle in a base line, or, which is equivalent, 90 deg. in addition to the number of degrees by which its slope exceeds a right angle."

DRAUGHTSMANSHIP.

IN our remarks five weeks since,* on "Recollections of the Drawings of Architectural Works at the Paris Exhibition last year," we took occasion to insist on the mere comparative value of draughtsmanship, considered merely as one of the elements required in the production of architectural works, or as one of the points of excellence in an architect, and specially to urge that, however valuable or indispensable generally, it was not the end or aim of an architect, but solely a means.

Our object is now to warn architects against the seductive influence of mere drawing, and to point in one direction, at least, where we think it has been allowed to usurp too much attention, to the exclusion of bolder and more practical work, and to exert an influence where it ought to be perfectly subordinate and forgotten—that is, on the executed work itself. But some may be ready to enquire what, then, is to be the aim of an architect—what the object of his office studies—why such application to the drawing board—and why so much authoritative tall-talk about the study of the figure, the value of good drawing, the delight and advantage of perspective studies, if after all the chief object be not to draw well or to express architectural ideas in lines and circles, and embody floating fancies of the mind in pencil work on the paper, so that others may see in a gilt frame the same dream which is haunting the architect's imagination? In reply, we will urge a few considerations in support of our point, instancing the fact that French drawing has in too great a measure influenced French design, making it flat, faultless, and finished, whereas the vigorous hand of those accustomed to work in solid materials should affect the drawing, and put nerve and strength into lines and dots, thus producing full and fearless forms, which, though shown indeed by lines, dots, and circles upon paper, are adapted for solid work in stone, brick, iron, wood, and the other materials with which the architect has to deal. But we desire rather to open an enquiry than affirm a judgment, and are as willing for a verdict against, as for, our arguments, if only the matter be brought into court, and the *pros* and *cons* properly considered. Without endorsing the whole of Ruskin's broad statement as to what an architect has to do, we may in the main agree with him when, describing the glorious sculptures adorning some great cathedral doorway—Rheims perhaps—he states that the architect was the man who did *that* (and probably he would "*do*" it best without draughtsmanship at all), for to such a man the designing of the frame of the picture must come easy after executing the picture itself.

To be led astray from right principle by beauty of workmanship is common enough in all the arts, and to award praise for skilful manipulation rather than noble design is rather the rule than the exception, even with those who profess to be able to discriminate and pronounce authoritatively on this or that artist or art workman. But, however objectionable this want of judgment in a critic, such a defect is fatal to the artist himself; and, unfortunately, there are hosts of examples of those who are ever ready to mistake technical skill for high art and draughtsmanship for design. Of late much error of this kind has been eradicated by right-thinking protests in favour of truth, solidity, and good appropriate design, in opposition to the flimsy finish of fanciful forms which so greatly obtained in the no-art period of the last century; but still there is need, perhaps more

* Page 237, April 10.

than ever, for watchfulness and careful criticism, lest such perpetrations as we have seen of late should grow to be considered the effect of real architectural design rather than the result of clever but impracticable draughtmanship, without the great balancing faculty so necessary not only in all the arts, but in every walk of life—viz., judgment. We use this term for want of a better, though it will hardly express all we mean by the word; but what else is it which leads some men to success and noble result, while others, following the same path, come only to grief and mere emptiness, or, perhaps worse, bad result?

Anyone can easily suppose an architect with all the power of draughtsmanship and skill even in colour yet without power of applying them to practical purposes. Such an one would be deficient in judgment, and this might be the case equally if the individual were possessed of considerable constructive skill in addition. For such an architect to be placed in a responsible position with regard to any important public work would be a misfortune, but from this we are usually saved by the necessary training which the world and its competitions exact from all aspirants to fame or positions of authority. Still we are not without examples of absurd and mischievous designs, carried out in a way which shows that the chosen architect, in reality a mere draughtsman, could not have considered how his chamfers and his choppings would look when transferred from the drawing board to the stone, nor understand the effect of wide cornices in dark streets, or the appearance of egg and tongue mouldings when covered deep in soot and dirt among chimney-pots high up aloft. Let us suppose a painter so capable of painting satins and brocades (no impossible case, nor wanting a name as an example at this very time) that, instead of choosing some great and noble idea for his pencil, or some simple or worthy thoughts as the *motif* of his pictures, he chooses rather something wherein he can show his silk and satin skill to advantage. Would not this be even less reprehensible than an architect allowing his mere pencil work to be repeated in stone, simply because he could draw it well on paper? Though in neither case need we suppose the result to be bad, yet a great opportunity may be lost for doing good and noble work. And surely, for example, the large mass of fleeting ornamental detail and frittered finial-working which is now being erected in Belgravia would have been avoided if more consideration had been given to the actual appearance in execution instead of the design on paper, for it seems as if mere technical handiwork had been approved in place of more mature judgment being exercised. Of course we may be mistaken in this view, but at any rate it is a charitable one, for however admirable may be the Grosvenor improvements as a whole, we must be allowed to object to a great deal of the detail as not improved by importation, and not capable of being kept well in the present London atmosphere. We miss in these designs the bold simplicity—which is itself dignity—or the judicious ornamentation which gives that quality to otherwise poor design; or, again, that subdued magnificence of well-chosen richness of detail which prevents the mass from appearing overloaded, and the parts from becoming vulgar by excess of ornamentation. In the Houses of Parliament we have an example of this latter quality, of grandeur by richness, and simplicity by uniform decoration, and breadth by continued cutting up into detail.* But we are wandering from our text, though in returning we may note, with reference to the Houses of Parliament, that the Pugin-Barry controversy seems to have dwindled to a question of draughtsmanship after all; and we are very much inclined to think that here will be found the root of the matter. Though no one would doubt for a moment (or if they would let them look at the existing drawings) that Sir Charles Barry *could* draw with his own hand anything he set himself to do, still one must know that he physically could not do all the original drawings required while attending as architect to all the various details daily demanding his care, not only in this one work, but in many others being carried on at the same time. Sir Charles Barry might not be one whit less the *architect*, the man of comprehensive design, to whose *judgment* all must be subordinate, the one mind to give unity, individuality, and purpose to the conflicting or (say) concordant ideas of many first-rate draughtsmen and men of genius, although he called to his assistance the first-rate powers of all the Pugins of the day.

This one quality of judgment is the mainspring, or rather the encircling chain, of all the other qualities required (whether these qualities lie in one direction or another, or are resident in one man or set of men) to produce a work of high merit, and we can even suppose a great architect carrying out his work with the most complete success deprived by some unfortunate accident of his own hands and arms, and thus dependent upon others for the technical skill of necessary delineation. By this example we feel bound again to our assertion, that draughtsmanship is not all in all—that it is but a means to an end, and not the end itself; that end being simply to build a solid in the empty air, where the sun and moon will gild and decorate his work after he has done his best, and the wind and storm will carve and crumble it away after his most careful efforts to make it last for ever. A man may learn to draw the figure, paint up the finest perspective, or carve the sweetest foliage and the noblest statues for his niches, all in addition to preparing paper plans and elevations; but as an architect he will have severer work, and be required to use, after all, a higher faculty in judging and deciding on the effect of his ideas when permanently executed.

Far be it from us to impute to the French the want of such a faculty; but, as we have been led to these remarks from a comparison of their style of drawing with our own, we may say that if it is not so, they seem deliberately to propose to themselves to set up their drawings in stone, rather than to build from their designs. In much of modern Parisian building at least—and the provinces merely copy the metropolitan fashions—we see such monotony of flatness, such extreme delicacy of line and want of all boldness of projection, that the real lines on the façade seem to bear no greater proportion in depth or width to the whole façade than do the original draughtsman's lines on the drawing board, making allowance for the scale; and just in the same manner as a delicate drawing is always "pretty," so are these *petite* ornamentations of the actual work "pretty," elegant, and full of draughtsmanship, but really with no more pretension to architecture than the lengths of cement strings and cornices which adorn mere builder's work in this country. A new Paris façade is the same in every new street, boulevard, or place, with some little variety in balconies or gateways; but viewed at a short distance, whether of Gothic or Renaissance details, or even with the details of the better style of modern French adaptation of Classic, every house seems of the same design—that is, follows the same leading lines, and, being built in block, is probably, when erected and before the design is ruled out upon it, capable of being as easily finished in one style as in another.

Such we deem to be the result of draughtsmanship carried too far, and when the other qualities necessary for an architect to cultivate are too much ignored. While we thus feel we have justified ourselves in what we have advanced, we would be understood as far from undervaluing any means of realising the ideas which form a design or manner of fixing the forms of the imagination for the purpose of study by the architect himself. We well recollect the late Professor Cockerell's exhortation not to trust to elevations and sections alone, but to study every design in perspective; and not with these even to remain satisfied, but to model it as a whole as well as all the details separately to some large scale. To the practical carrying out of this doctrine in his own case may be attributed that marvellous refinement and delicacy, and yet vigorous handling—breadth with light and shade combined—which the French school and their copyists seem to ignore. No one, we believe, was more faithful to his own principles and precepts than the late Professor of the Royal Academy, or took more pains to form a correct judgment on his own designs, while few such careful or accomplished draughtsmen now exist. We know no name more worthy of reverence, nor anyone whose teachings deserve more respect from every school or style of art.

A. B. C.

* Ruskin says good ornament can never be in excess, but bad ornament is out of place everywhere. In the life of Sir Charles Barry, we see that he was substantially of the same opinion, and held to the most complete and richest decoration, as being the reverse of gaudy or vulgar. He was consequently in the habit of using gold in masses, not for touching in parts.

IMPORTANT TO BUILDERS AND PARTIES BUILDING.

Clerkenwell County Court, May 18.—Before George Francis, Esq., Deputy Judge.—Ewins v. Squires.

THIS was an action brought for recovery of £17 3s. 10d. balance due from the defendant to the plaintiff for bricklayer's work done to a pair of villas in the Mayes-road, Wood Green. Mr. Poncione, of 5, Raymond-buildings, Gray's Inn, and of Wood Green, appeared for the plaintiff, and Mr. Williams for the defendant.

Mr. Poncione, in opening the case, stated that in the month of June last the defendant engaged the plaintiff to build a single house upon a plot of land belonging to the defendant in the Mayes-road, Wood Green, the terms of such arrangement, which was a verbal one, being that the plaintiff was to be paid by time. On the completion of this single house the plaintiff and defendant entered into a written contract for building a pair of villas adjoining the single house, for which the plaintiff was to be paid 48s. per rod reduced brickwork. The plaintiff had almost completed the building of this pair of houses when the defendant refused to pay the plaintiff any more money on the ground, as the defendant alleged, that the three houses were all to be built at the rate of 48s. per rod, and that after measuring the whole of the work and crediting all moneys paid as payments generally on account, the plaintiff had been overpaid. Mr. Poncione contended that the verbal contract for payment by "time" must be kept wholly distinct from the written contract for payment by the rod. With regard to the time contract it had been paid for from week to week on production of the time sheets, and the work had been completed and paid for, and there had been a final settlement of that matter, and as to the work done under the written contract it had been carefully measured by Mr. Henry Girling Bray (the brother and successor to the late Mr. Thomas Girling Bray, of Wood Green, surveyor), who was in court and could prove the amount of work done, but on this point it was thought there would be no question, as Mr. Poncione understood the defendant's surveyor concurred in the correctness of Mr. Bray's measurement.

Mr. Williams stated that he would admit the correctness of Mr. Bray's measurement, his defence being that the work had been paid for.

His Honour here decided that that being so, and the affirmative of the issue as to payment falling upon the defendant, he should proceed with the proof of his defence before the plaintiff's witnesses were called.

Mr. Williams thereupon examined the defendant, who stated that he first employed the plaintiff under a verbal contract to build the single house and afterwards entered into the written agreement with him for building the adjoining pair of villas, which was signed on the 18th of July last, the day of its date. The plaintiff had,

however, commenced the work on the pair of villas before the agreement was signed upon a verbal understanding that its terms were to be reduced to writing. The building of the pair of villas was commenced at least a fortnight before the date of this agreement. All payments made by witness to the plaintiff were made generally on account, and after measuring the whole of the work executed on the three houses, he had overpaid the plaintiff the amount due to him.

Cross-examined by Mr. Poncione.—The plaintiff produced his time account to me from week to week whilst the single house was being built, and I paid him the amount the same as all other builders do.

Mr. Poncione.—What are you, a builder?

Witness.—Yes.

Mr. Poncione.—Now is not this your card (producing one, and reading)? "John Squires, sen., pianoforte maker, 22 and 23, Sutterfont-street, Caledonian-road. Instruments tuned and repaired."

Witness.—Yes; I am a builder of pianofortes, and I have also built some houses (laughter).

Mr. Poncione.—You mean you employ some one to build them for you. I advise you to be careful how you answer when on oath.

Mr. Gylby, examined on the part of the defendant.—I am a surveyor, and from time to time measured the houses built by the plaintiff for the defendant. The building of the pair of houses was commenced at least a fortnight before the date of the written agreement of July 18 last. I produced my book containing the measurements made by me from time to time.

Cross-examined by Mr. Poncione.—The first measurement contained in my book in respect of the pair of villas is July 19 last; all previous measurements contained in my book refer to the single house only.

Mr. Williams stated that this was all the evidence he had to adduce in support of the defeuce.

Mr. Poncione, on the part of the plaintiff, submitted that as the evidence stood the defendant had failed to make out any case to be answered. It was clear from the defendant's own showing, the date of the contract, and that of the first measurement of the defendant's surveyor relating to the pair of villas, that the written agreement of July 18 last was entirely a separate and distinct transaction to the prior verbal agreement relating to the single house, which was to be paid for by time, and the defendant by his own showing had treated it as a separate matter, and in his own book, which he had produced, he there made a separate casting of the sums paid prior to the date of the written agreement. Even if the defendant's version were true (which was, however, emphatically denied) the law would not permit a general payment to be applied to a written contract to be made in future; therefore, all payments made prior to the date of such contract must be applied in respect of the verbal contract then pending, by which the plaintiff was to be paid by time, and such payments have nothing whatever to do with the present claim of the plaintiff under the written contract, by which the plaintiff was to be paid by the rod, but inasmuch as the plaintiff and his witness had sworn that the building of the pair of villas was commenced at least a fortnight before the date of the written contract of July 18 last, and had endeavoured to make payments made during that period apply to the present claim of the plaintiff, witnesses would be called on the plaintiff's behalf who actually commenced the brickwork to the pair of villas, and would distinctly prove that the work was not commenced until Tuesday, July 16, two days only prior to the date of the written agreement, and that being so it could not for one moment be contended that payments made prior thereto could have been made in respect of works which did not actually exist, and in respect of a written contract not then entered into.

Mr. Poncione then shortly examined the plaintiff, who proved that he was first employed to do the brickwork to the single house, and to be paid by time; that he afterwards entered into the written contract to build the pair of villas; that all payments made to him prior to July 18 last, the date of the written contract, were in respect of the contract for time, and all payments made to him subsequently to the date of such contract were in respect of the work done under the written contract, for which he was to be paid 48s. per rod. The building of the pair of houses was not commenced until July 16 last, two days prior to the date and signing of the agreement. After crediting all sums received from defendant on account from time to time in respect of each contract there was a balance due to the plaintiff of £17 3s. 10d.

Henry Botting was then called to corroborate the plaintiff as to the date when the pair of villas was commenced.

Mr. Poncione stated that he had several other witnesses in court, who worked at the commencement of the building of the pair of houses, and could speak to the same facts.

His Honour thought it was unnecessary to call them.

Mr. Williams then replied upon the case.

His Honour, in delivering judgment, stated that it appeared to him clear that there were two distinct transactions between the plaintiff and defendant, and that the payments alleged to have been made by the defendant prior to the date of the written contract could not be treated as having anything whatever to do with such contract, and his Honour came to that conclusion from the evidence of the defendant himself and his own witness—for the defendant had made a separate casting for all sums paid prior to the date of the written contract, and had not the time contract been a separate matter he would not have done so; besides, the defendant's own surveyor, by his book, showed that the first measurement made by him of the pair of villas was on July 19 last, subsequently to the date of the written contract. His Honour, therefore, gave judgment for the plaintiff for the full amount claimed (less £2, which it appeared had not been credited in account), and allowed costs, including all the plaintiff's witnesses who had been called and were in court ready to be examined had it been necessary to examine them.

Mr. Williams then applied for time for payment.

Mr. Poncione.—What, a respectable builder of pianofortes and no end of houses want time? I must oppose such an application.

His Honour ordered immediate payment of debt and costs.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE annual meeting of the members of this society was held on Wednesday week, Mr. T. J. Kilpin, president, in the chair. Mr. H. H. Vale expressed his intention to offer a prize of two guineas for the best essay written by a student member during the recess upon some subject to be suggested by the council and announced at the annual excursion. The President handed to Mr. George Smith and Mr. J. Casson respectively the prizes awarded by the council for the best and second best designs, by student members, for a village church, and to Mr. T. Medcalf and Mr. H. Z. Herrmann for the best and second best specimens of figure drawing. The committee and officers for the ensuing year were elected, Mr. H. P. Horner being unanimously chosen as president, and Messrs. W. Hay and H. H. Vale being appointed vice-presidents.

The President then delivered his closing address. After congratulating the members on the increasing strength and expanding influence of the society—remarking that if Liverpool was subject to the stigma of at present being the only large city in the country that had no annual exhibition of painting and sculpture, and of possessing the ugliest parish church in the empire, it was certainly not the fault of the Architectural and Archæological Society—he alluded to the subject of labourers' dwellings, and said it must be admitted that that subject till of late years had been too much overlooked. Liverpool had, however, made great exertions, and had at length achieved greater success in that direction than any other large community, as a design for labourers' dwellings had been selected, estimated, and contracted for, and was now being carried into execution, which would yield, according to well-grounded calculations, a remunerative return to the corporation on the capital invested. He thought it could not be denied that a large debt of gratitude was owing to the council, and particularly to those members of it on whom had devolved the consideration of the plans. He expressed his regret that at present the fine arts were ignored in Liverpool, there being now no annual exhibition, as in former years, and severely blamed the municipal authorities for their ill-judged economy in withdrawing the slight pecuniary assistance formerly afforded to the Liverpool Academy. Since the commencement of the session, the feeling and opinion that it was not honourable to Liverpool that it should possess no more worthy ecclesiastical edifice than St. Peter's for its parish church had extended itself and had been considered and discussed by the public till it had deepened into a settled conviction. It seemed to be the general opinion that the £5,000 to be paid for the portion of St. Peter's churchyard that had now been added to Church-street, should form a nucleus for a fund for erecting a more suitable building consecrated to Divine worship. Mr. Kilpin closed his address by expressing a sincere wish and fervent hope that while we bid

> New harbours open, public ways extend,

we should soon also see

> A temple worthier of the God ascend.

THE ARBITRATION MOVEMENT.

IT is satisfactory to see that this movement is making progress. The master builders of Birmingham held a meeting on Tuesday last in reference to the strike of the unionist operative stonemasons of that town. In providing rules for the future, they say, in rule 7, that on or before August 1 next, a public meeting of the masters and operative masons of Birmingham shall be held, at which three master builders and three operative masons shall be appointed as trade arbitrators, and an independent gentleman as trade umpire, and if any trade dispute shall arise between master and workman, such dispute shall be settled by the award of the trade arbitrators, or by a majority of them, or in any case where they or a majority of them cannot agree, then by the award of the umpire. Mr. Mundella, of Nottingham, has been to Bradford, and entered into the question, and the result is the formation of an arbitration court in that town. The following are the rules of the new court:—

1. That a board of trade be formed, to be styled the "Board of Arbitration and Conciliation for the Carpenters and Joiners of Bradford and district."
2. That the object of the said board shall be to arbitrate on any question relating to wages, working rules, and any other matters that may be referred to it from time to time by employers and employed, and by conciliatory means to interpose its influence to prevent and settle disputes.
3. That the said board shall consist of eight employers and eight operatives, and that the whole of the deputies shall serve for one year, and be eligible for re-election. The annual election of deputies to take place in March.
4. That the said board shall have full power to settle any disputes that may arise from time to time, and the decision of the said board shall be binding on all parties concerned.
5. That the board shall, at its annual meeting, in April, elect a president, vice president, and two secretaries, who shall continue in office one year and be eligible for re-election.
6. That the president shall preside over all meetings of the board, and in his absence the vice-president. In the absence of both president and vice-president, a chairman shall be elected by the meeting present. The chairman to have a vote, and in case of numbers being equal the chairman to have the casting vote, and that six on each side shall form a quorum; but in all cases an equal number of employers and employed shall only be allowed to vote in any decision.
7. That a sub committee shall be formed to enquire into all cases of disputes, and, if possible, to settle the same; but such settlement to be binding on either party must have the approval of the general council. Such sub-committee shall consist of the two secretaries, two employers, and two operatives, selected by the secretaries from time to time as occasion requires, from the members of the general council.
8. Upon a requisition signed by any three members of the board, the secretaries shall within seven days convene a special meeting of the general council by circular specifying the nature of the business for consideration, provided that such has first been submitted to the sub-committee, and left undecided by them.
9. That there shall be three general meetings of the council in each year; one in the first week of April; one in the first week of October, and one in the first week of February; and at the February meeting the secretaries shall submit a report of the year's transactions.
10. That any expense incurred by this board shall be borne equally by the employers and employed.
11. That no alteration or addition be made to these rules except at one of the half-yearly general meetings in April or October. Notice of any proposed alterations shall be given in writing at the half-yearly meeting previous to its consideration.

For welding iron and steel a composition has lately been patented in Belgium, consisting of iron filings, 1,000 parts; borax, 500; balsam of copaiva, or some other resinous oil, 50; and sal-ammoniac, 75. They are mixed, heated, and pulverised. The process of uniting the iron and steel is as usual. The parts are heated to a cherry red, covered with the preparation, brought together, again heated and welded. Another composition for the same purpose is 15 parts of borax, 2 of sal-ammoniac, and 2 of prussiate of potash. Being dissolved in water, the water should be gradually evaporated at a low temperature.

ARTISANS' AND LABOURERS' DWELLINGS' BILL.

THE Artisans' and Labourers' Dwellings' Bill has at length worked its way through the troubled waters of the Lower House to what its promoters hope to be the safe harbour of the House of Lords. We are sincerely sorry that we cannot join in this hope. We heartily desire the improvement of the people's dwellings; we have not the smallest sympathy with the vested interests which fatten upon disease and immorality; our object is the same as that of the friends of the bill; and we cannot agree with them, for the only reason that we believe they are not taking the most efficient means to attain their object. Before objecting, however, we must give every praise to Mr. Torrens and his friends for their perseverance and their readiness to adopt judicious suggestions. At the first introduction of this bill, in 1866, it consisted of but eighteen clauses. The number has now increased to forty-seven, and the bill has altogether a most complex appearance. This fact of itself proves that legislation upon improved dwellings is by no means the simple process a tyro would imagine. On comparing the bill, as it now stands, with its first state, we are glad to find that many of the proposals made by the joint committee of the Society of Arts and the Social Science Association have been embodied in it, and that it does not, as it did at first, ignore private enterprise altogether. The bill now permits the local authorities, after having acquired property under its provisions, either to assume the functions of builders themselves, or to dispose of the site to a building company, who shall give security to carry out improvements. To judge of the practical effect, let us suppose a case. Deadman's Rents is a fearful back slum, where the fever is never absent, and vice and immorality are always present. Old Deadman, the proprietor, however, has gathered a rich harvest every week there for many years, and when the local authorities have condemned the place, and required him to effect the improvements, he laughs them to scorn, and under the act they compel him to sell it. Despite his name, he proves a lively hand at a bargain, and gets a good round "compensation" price. The authorities burden the property with the expenses of their action, and, electing to sell it rather than turn builders themselves, under the act they are called upon to tie down would-be purchasers to a particular plan of building. They will find that they have bought in a dear market and must sell in a cheap one. We will venture to say that no company whose directors are men of business will give them anything like the price the property will have cost them. The difference will have to be made up out of a twopenny rate, and then—Oh, what a clatter! what denunciations of official jobbery! Old Deadman's Rents have been bought for £2,000 and sold to the Nonshaky Building Company for £1,500, and the ratepayers must provide for the deficiency. We ask the promoters of the bill whether this is not a probable picture of the measure in its practical action. They say, we know that the twopenny rate (it was to have been threepence, but is now reduced to twopence) will not be required. In this no practical man will agree with them. As the bill now stands, the authorities will be subjected to conditions of purchase and resale, or rebuilding, which must entail a very heavy loss, and so surely as the bill passes, so surely will there be an addition to the already overswollen local taxation. We do not think there would be near so much objection to taxation for the purposes of the measure, if it did not empower the authorities to enter upon speculations either in the purchase of sites or the building of houses. Everyone would cheerfully agree in necessary expenses for the clearing away of overcrowded sites, or the lawyer's bill for making old Deadman and his kind put their houses into wholesome condition. What is and always will be objectionable is the taxing ourselves for the sake of buying old Deadman out at the fancy price which a compensation jury will be sale to give him, and then to adopt the alternative of selling our bargain at once at a clear loss, or undertake a work which does not at all come within the proper province of public authorities, of which they are unacquainted with the details, and it is more likely they will manage both inefficiently and expensively than otherwise. If the act stopped at the point where it provides that unwholesome houses may be shut up, and gave the authorities power of purchase only for the sake of clearances, we think it would be both unobjectionable and effective. As it stands it is sure to be unpopular if passed, and likely to prove a dead letter, and this would be an actual calamity to the cause of sanitary improvement in the dwellings of the people.

THE RATEPAYERS' STREET TRAMWAY.

ONE of the greatest obstacles to the introduction of street tramways into London has been the well-founded objection to confer upon a trading company any rights of property or control over the public roads. The vestry of St. George the Martyr, Southwark, are, however, about to lay down in the London-road a double experimental line, which, if successful, will show that this objection need no longer be entertained. The plan they have adopted, and of which we give a diagram, is designed by Mr. John Haworth,

FIG. 1.

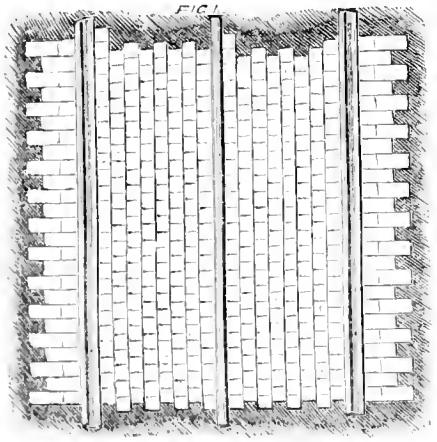


FIG. 2.

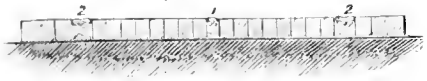

FIG. 3.

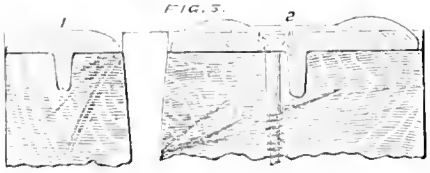


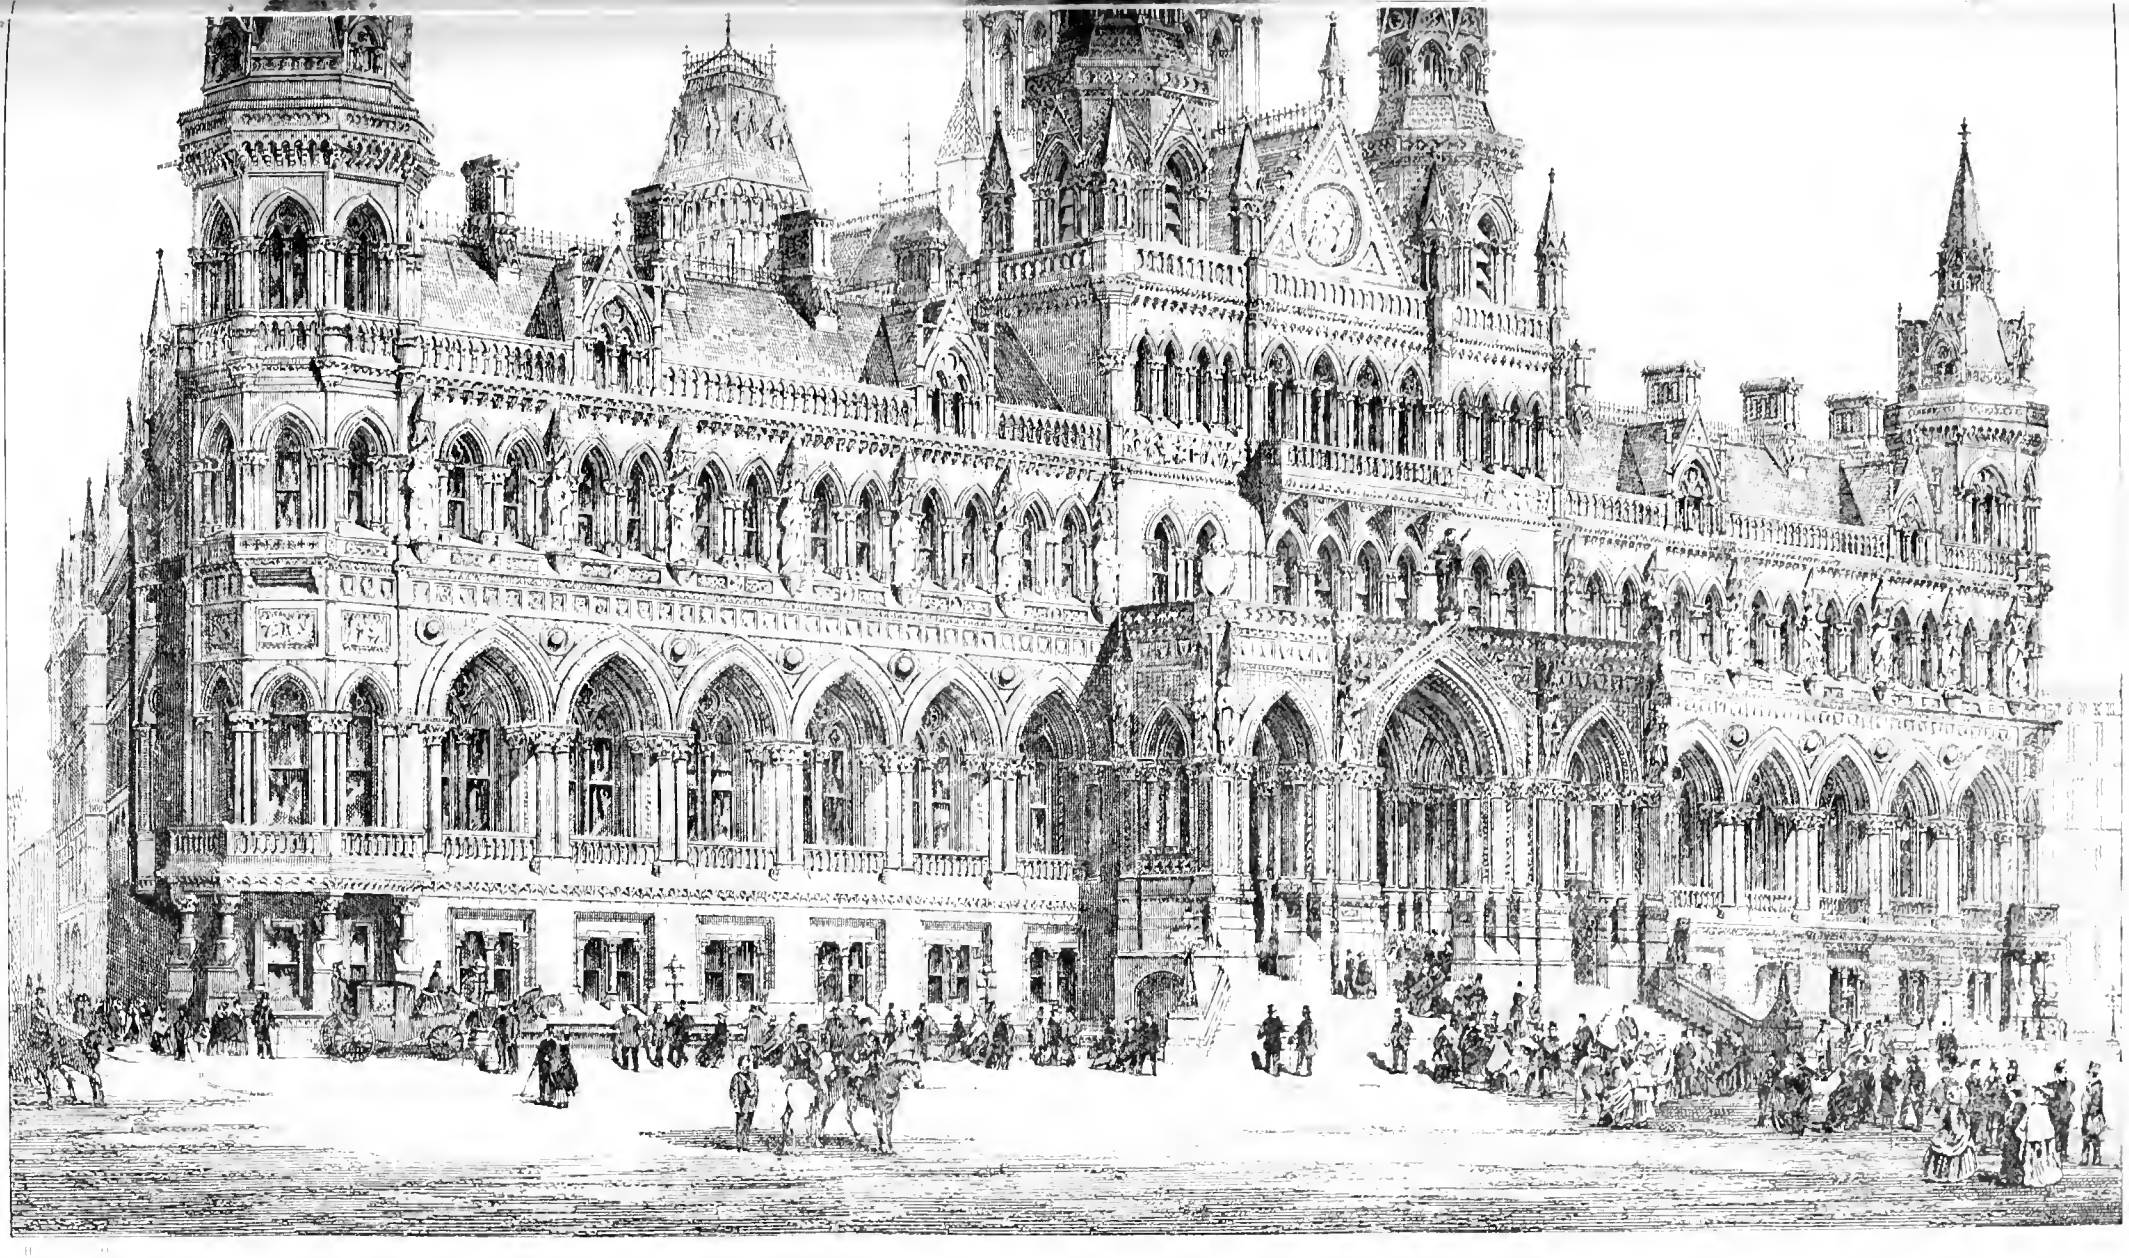
of Manchester, being a modification of that used in Salford with great success for several years. The rails for the wheels are of wrought iron about 8in. wide, and the sides are so very little out of the ordinary level that vehicles can leave the tramway or return to it with the utmost facility at any part of the road. Running midway between each set of rails for the wheels is a plain 3-inch rail, which is intended to serve as a guide for the driver, who will be able to sight the end of the pole with it, and thus keep the track. The up and down sets of rails will be separated by a width of 4ft., and the whole space between will be paved with 4in. by 4in. granite cubes. The plan is recommended for adoption on the score of economy as well as convenience, the estimates for completing the paving of the London-road being as follows:—1. The estimated cost of completing the pitching was £3,994; 2. The estimated cost of taking up the existing paving and paving the whole of the road was £4,405; 3. The estimated cost of completing the pitching with 4in. by 4in. granite cubes and the laying of a double tramway on Mr. Haworth's plan was £3,629; 4. The estimated cost of the tram, but with 9in. by 4in. cubes, was £4,449. It was also stated by a member of the vestry that the town of Salford had realised a saving of 3¾d. per yard in the expense of road keeping, and that in disproof of the supposed danger to horses from the tramways, not a single accident had occurred in Salford through them for three years. From the estimates above given it will be seen that the saving in cost is due to the use of 4in. by 4in. granite cubes, instead of the ordinary 9in. by 4in. cubes. These, however, it is said, will prove quite as durable in every respect.

We congratulate the St. George's Vestry on taking the lead in this matter. The length of road to be laid down is only 450 yards, and can only be regarded as an experiment, but we are sure that tramways of a proper construction only need to be practically known to lead to their extension. Our only wish is that the Manchester or Salford plan could be adopted in its entirety. Upon that plan the centre rail is grooved to receive a small guide wheel or perambulator attached to the vehicle, which can be raised or lowered at the pleasure of the driver. This permits of the whole of the tramway being made quite flush with the roadway, and there is consequently not even the slightest pretence of obstruction to ordinary vehicles crossing it, or the smallest difficulty in keeping upon the line as long as desired, or quitting and rejoining it at any moment. We can understand that one reason why the vestry have not adopted the centre grooved rail, is that no vehicles, with a guide wheel attached, at present run upon the London roads. This is a matter, however, in which they would do well to be in advance. Upon the same line of road we have several omnibuses imitated from those of Manchester in other respects, and, if they had the Manchester road, they would doubtless soon find it answer their purpose to add the guide wheel, which would render their vehicles equal to those of Manchester in all respects. We hope the example of St. George's Vestry will be followed by other parishes, and that the tramway system will be extended over the whole metropolis, and we shall be the more glad to find that it can be done without subjecting ourselves to the incubus of a monopolising company, and that the roads laid down will not be for omnibuses only but for every kind of traffic.

DESIGN FOR THE MANCHESTER NEW TOWNHALL.

WE give this week a double-page illustration of Messrs. Speckman and Charlesworth's design for the Manchester New Townhall. Having so recently given our opinion of the high architectural merits of this design, it is unnecessary that we say any more now. The professional referees gave this design the first place for its architecture.

One of the most important recent acquisitions to the South Kensington Museum is a cast of the whole of a window in the west front of the Church of the Certosa, at Pavia, which convent was founded by G. G. Visconti, Duke of Milan and Lord of Pavia, 1396. The façade of the church, which comprises on the lowest tier of its lights four such windows as that in question, was designed by A. Da Fossano, or Borgognone, and begun in 1473. This artist, being a painter by education, produced what may be called a beautiful picture, or rather collection of small pictorial designs, in terra-cotta, and combined them with good results.

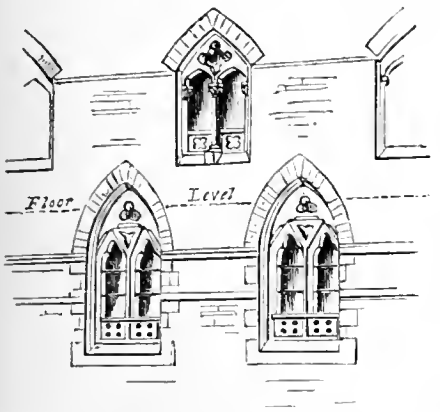


Design for the Manchester New Town Hall. Albert Square & Princes Street Fronts.

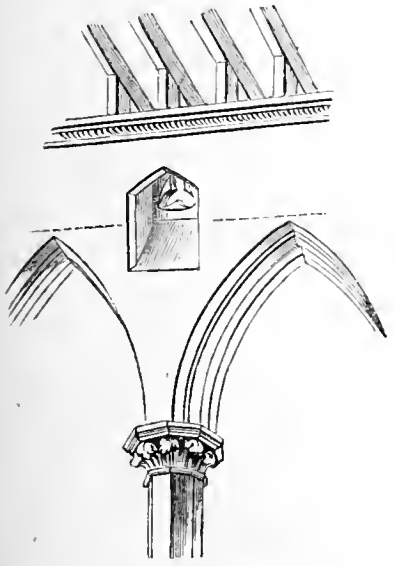
SPEAKMAN & CHARLESWORTH, ARCH.TS

CONSTRUCTIVE AND ÆSTHETIC DESIGN.—XV.

BEFORE leaving that branch of our subject which deals with design as applied to brick and stonework—the widest field for the display of architectural power—I will refer to one or two points in construction that call for remark. The generally admitted

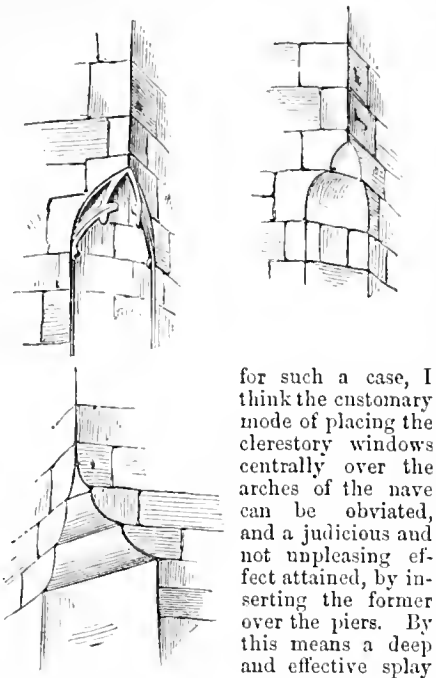


rule in building, that void should come over void, is a safe and correct one in the generality of our compositions. It gives us a verticality of treatment that is absolutely essential in those structures that come within the denomination of Classic or Italian, where it produces a valuable contrast by opposition to the horizontal features; and many modern buildings show how their architects have still further marked the contrast by connecting their windows or openings vertically rather than, as formerly, only horizontally by bands



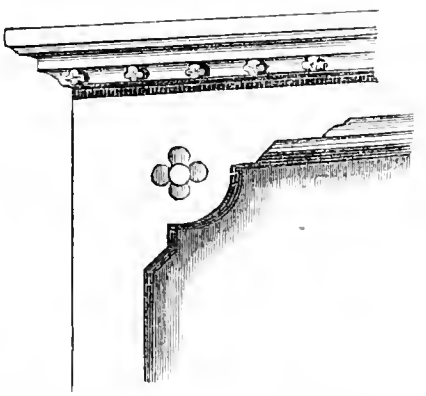
or stringcourses. We find, indeed, this principle of contrast or opposition doing more than any amount of championship or talk in breaking through the distinctions that characterise different styles. Such a disposition of openings, however, is not always to be regarded. In buildings partaking of a pointed character, the second tier or first-floor openings may often be placed over the solids below without interfering with the apparent or structural propriety of the design; and the nature of the pointed arch already considered, namely, the necessity of its being largely loaded at the apex as a condition of its equilibrium, rather concurs in such an arrangement than otherwise. Very often the lofty heads of pointed windows compel the architect to provide greater height for his façade or his apartments than is always desirable, but, by adopting this plan of placing openings, the necessity of great height is obviated, for he may still preserve the pointed arches externally without cramping his windows.

In churches where height needlessly adds to the expense, as in country neighbourhoods, it is often desirable to obtain a clerestory just for the purpose of effect or ventilation. Now,

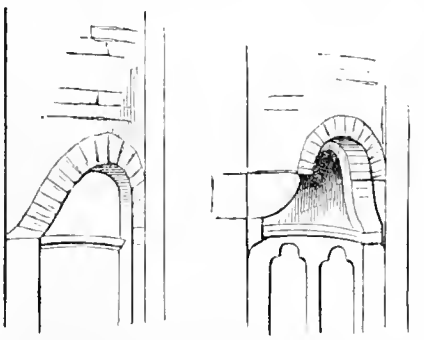


for such a case, I think the customary mode of placing the clerestory windows centrally over the arches of the nave can be obviated, and a judicious and not unpleasing effect attained, by inserting the former over the piers. By this means a deep and effective splay may be got internally, and the openings be made to relieve the spandrels of the arcading, at the same time enabling the roof-springing to be brought down within a comparatively short distance from the points of the arches. The author has seen the arrangement in an old and little known church.

This plan leads me to notice a practice



frequently observed in the design and construction of modern churches that calls for condemnation and correction. It is the cropping-out of clerestory buttresses above the sloping aisle roofs without any real or apparent provision for their support. I have repeatedly seen these adjuncts in designs for churches, but a close inspection of the drawings has failed to discover any foundation for these make-believe supports. Let architects abandon such delusive accompaniments, that only render design an artless sham and themselves its unconscious detractors.



Our sketches show, besides the above constructional suggestions, methods of "corner cutting" or angle splays, that are far better than sharp angles in our corner structures; and a suggestion for correcting the distorted appearance, very often noticed, of a circular arch on a circular plan, a point of construction that cannot be too strongly denounced, giving us a false arch both in reality and appearance.

NEW BATHS AND WASHHOUSES.

ABUNDANTLY and admirably as London is provided with good things that minister in various ways to the comfort and convenience of life, it would be too much to assert that her three millions of inhabitants have no further wants to be provided for. Her sanitary appliances are not the least satisfactory of her arrangements, and yet in the matter of public baths and washhouses the metropolis, it must be confessed, is not so favourably circumstanced as some other large towns, her gigantic population considered. We speak only of baths for the masses—the great body of the people, who, as a rule, have neither the means nor the convenience, admitting they had the inclination, to supply themselves with this very important means to health. There are some things which a public company can do for an individual better than an individual can do for himself. Among these may be reckoned public baths and washhouses. We might point to those at Endell-street, at Lambeth, at Islington, and elsewhere, most excellent establishments of their kind and in their way, and conferring benefits very largely appreciated by the public. Now, there is not enough of such institutions. While some districts offer a plentiful supply of soap and water to their toiling populations at the smallest possible cost, other districts are almost completely destitute of this great promoter of health and auxiliary of godliness. What may be called the soap-and-water movement is spreading, however. The necessity of providing baths for the public is now universally recognised. About three years ago the local authorities of St. Pancras resolved to erect public baths and washhouses for the use more particularly of the inhabitants of that extensive district of the metropolis. The cost of the building was to be paid out of the parish rates. The new baths were begun, and after a lapse of three years they were this week opened to the public. It is not too much to say that they are an immense acquisition to the district. With the single exception perhaps of Endell-street baths, the arrangement and management of which are in every respect most praiseworthy, those now opened in King-street, Camden Town, are vastly superior to anything of the kind in the metropolis. There is no architectural front elevation to speak of, and the unpretending entrance to the baths does not convey any idea of the extensive range of buildings behind. The baths occupy a large space of ground, and the building consists of two storeys besides an underground floor. On the first or ground floor are two fine plunge or swimming baths, each 60ft. long by 20ft. wide, and having a depth of 6ft. 6in. at one end, and 4ft. 6in. at the other. The baths, however, will seldom, if ever, be filled to their utmost capacity. The first class bath will be sixpence, the second twopence. Both baths are paved and lined with tesselated pavement, and ranged round the sides are 54 dressing boxes for the use of the bathers—that is, 27 boxes for either class. The first class boxes are each furnished, or will be furnished, with a looking-glass, comb and brush, bootjack attached to footboard, clothes' pegs, &c., and each set of boxes is provided with water-closet and urinals. The roof is of glass, affording abundant light. At night the baths are lighted by a series of gas jets suspended from the ceiling. The private baths are on the second floor, and number altogether 101. There are 33 first-class baths, of which eight

are for females; the remaining 68 are second class, ten of these being women's baths. The price for a tepid bath is sixpence, for a cold bath threepence, and no one will say that these charges are other than extremely moderate. As in the case of the plunge baths, the first-class private baths are fitted up in a style somewhat superior to the others, and they offer several additional little comforts for the higher price. The whole of the baths, however, present a remarkably clean, comfortable, and commodious appearance. All the working apparatus of the establishment is situated underground. Here are the engine room, containing an engine of 4-horse power, with 4 boilers and 2 cock furnaces for hot air. There are no fewer than 63 iron tubs or sinks for washing clothes, with 43 drying horses, besides wringing machines, and drying horses for bathers' towels. The light and ventilation of the building are excellent, and, altogether, the St. Pancras Baths must be considered a great public boon, and they are well worth a visit. The architects are Messrs. Messenger and Grundy, 1, Robert-street, Adelphi, and the contractors are Messrs. Manly and Rogers, St. George's-road, Regent's Park. The entire cost of the baths will exceed £22,000. We hear that similar baths are about to be erected in the Marylebone district.

CONTRACT AGREEMENTS.

THE Bristol branch of the Master Builders' Association held its monthly meeting last week. The chairman reported that Mr. Yalland and himself had in accordance with the wish of the association seen several of the architects of Bristol with reference to the question of contract agreements, and that they one and all admitted that the present form of contract was objectionable, but they considered that they could not move in the matter unless under the guidance of the Institute. One of the objections raised by the architects was that the quantities should not form a portion of the contract; they (the architects) did not think it reasonable that they should be held responsible for quantities taken out by surveyors. Mr. Yalland thought that that was nothing but fair. It seemed hard that the architects who did not take out quantities should be held responsible for the neglect of surveyors. In reply to a question, and for the information of those who are not posted up in the subject, the chairman stated that the propositions of the builders, which were agreed to some months ago, were:—

1. That the whole of the plans, sections, elevations, and working drawings shall be complete before the quantities are taken out and the contract is entered into.
2. That the specification shall only contain a description of the work to be done, materials to be used, manner and order of proceeding, and other matters connected with the actual performance of the work, and shall not contain any personal or legal conditions.
3. That the quantities of all works shall be taken out by two surveyors, one to be appointed by the proprietor or his architect, and the other by the builders about to tender for the works. That these quantities shall be taken out and abstracted into bills, as far as possible, upon one uniform system; if the quantities be taken by the architect's surveyor only, the employer to guarantee such quantities.
4. That the form of tender shall not contain any personal or legal condition.
5. That the contract agreement shall be perfectly mutual in all its stipulations and provisions; that the whole of the drawings, specifications, bills of quantities, and tender shall form part of the contract, and that there shall be protection for the builder in case of dispute.

The chairman was of opinion that builders had in these propositions asked for nothing that was unfair. No doubt the greater number of architects were straightforward, honest men, but in no condition of life were all men alike, and in the present case it was the system that required alteration.

THE PATENT LAWS.

ON Monday evening a meeting of the Delegates' Invention Right Committee, consisting of delegates from the Inventors' Institute, the Working Men's Technical Education Committee, the Workmen's International Exhibition Committee, the Foremen Engineers' Association, the Metropolitan Working Men's Clubs and Institutes' Union, and the Public Museums and Free Libraries' Association, representing in the aggregate upwards of 200,000 persons, was held at Cockspur-street, to consider the determination recently arrived at by the commissioners of patents to appoint three additional commissioners. Much dissatisfaction was expressed at the constitution of the existing commission, to the inefficient action of which body the chief evils of the present objectionable patent law system were ascribed. The course adopted by the existing commissioners, in now seeking to appoint three additional commissioners was strongly condemned by the speakers as being objectionable and inopportune, especially when it was considered that the whole patent law question must shortly be dealt with by Parliament. The following resolution was unanimously passed, and a copy of it was ordered to be forwarded to the commission:—"That in view of the want of inventiveness alleged to be now manifested in this country, and the pernicious influence thus exercised on manufacture and industrial progress, a thorough reform of our patent laws is a matter of paramount importance; and, pending the legislative revision to which these laws must necessarily be submitted in the first session of the reformed parliament, it is highly undesirable that any additional commissioners of patents should be appointed until not only the constitution of the present patent law commission, but also the whole of the existing patent laws, as they affect the interests both of inventors and the public, be fully discussed and settled upon a just and satisfactory basis."

ARCHITECTURAL SOCIETIES.

THE first meeting of the Architectural and Archæological Society of Northumberland and Durham took place yesterday, when Chester-le-Street and Lumley Castle were successively visited. In the churchyard at Chester-le-Street a paper was read by the Rev. W. Featherstonhaugh on "Roman Chester-le-Street." On the conclusion of the paper the party entered the church, the Rev. W. Greenwell adverting to the mutilated style of architecture carried out in the restoration of the edifice. Within the porchway the same gentleman drew attention to some fragments of early Anglo-Saxon crosses of beautifully refined carving, similar in character to the beautiful cross at Bewcastle, in Cumberland. He also drew attention to some slabs, formerly coffin lids, which bore various devices to denote the persons to whom they had belonged. The president stated that the sign of a sword upon the lids instead of in all cases denoting a soldier, as was generally understood, merely represented the coffin as that of a male, a pair of scissors denoting a woman; in some cases the trade was supplemented, as was seen in one instance where the coffin lid bore a hammer and pincers upon them, showing the owner to have been a blacksmith. Mr. Longstaffe described the various objects of interest within the church. The parties then proceeded to visit Lumley Castle where a paper was read by Mr. Longstaffe describing the building.

An ordinary meeting of the members of the Northern Architectural Association was held on Friday last at Newcastle, Mr. R. J. Johnson presiding. The chairman (Mr. Thomas Oliver) and Mr. F. Charlton were appointed delegates to the Architectural Alliance Meeting, to be held in London, on the 28th inst. Messrs. W. H. Hoskins, Darlington; J. B. Tilby, Sunderland; and George Connell, Newcastle, were elected associates. Mr. Oliver announced that the Northern Association had sent £5 5s. to the association as a donation to the Architectural Museum. The secretary drew attention to the question of concrete houses, as a subject that was attracting considerable attention just now, and an animated discussion ensued on the æsthetic and constructional qualities of concrete, in which the chairman (Mr. R. J. Johnson), Mr. A. M. Dunn, Mr. F. Charlton, and Mr. W. Pearson took part.

ARCHÆOLOGY.

MR. HOLMES, the archæologist to the late Abyssinian expedition, is making a collection of articles of interest to be handed over to the British Museum. Among these are the Abuna's mitre, said to be a fine piece of art, a chalice of solid gold, presented to the sanctuary of Gondar, by King Adam Segud about the middle of the fifteenth century, and several fine specimens of arms and rare manuscripts.

The soil of Rome, ever fertile in archæological treasures, has just yielded a fresh and very complete specimen of ancient mosaic art, being the pavement of a room excavated last week in the Vicolo Sterrato, a lane between the Barberini gardens and the new Constanzi Hotel. The importance and beauty of the pavement now found leads to the inference that the building containing it formed part of Sallust's villa, which, it is known, occupied this locality.

PARLIAMENTARY NOTES.

ON Thursday week Viscount Hamilton inquired upon whom rested the responsibility of the present impeded state of the thoroughfare in Park-lane, and why the works had remained so long unfinished. Colonel Hogg said that on January 31 the contractor was ordered to commence the works; twelve weeks were allowed for their completion, and they ought to have been finished on April 24.

On the same evening Alderman Lawrence drew attention to the narrow and insufficient approaches to the site of the proposed new Courts of Justice. Mr. M. Chambers concurred with the hon. alderman that no time ought to be lost in acquiring the property which it would be necessary to pull down in order to provide better means of access to the new courts. He commented somewhat severely upon the treatment which the competing architects had received from the commission, and expressed a strong opinion that the site upon which it was proposed to erect the Palace of Justice was ill-chosen, and could not to be made sufficiently extensive without pulling down the west side of Chancery-lane as far as Carey-street. This was, at all events, a subject for inquiry, and perhaps it might in the end be found desirable to erect the new building upon the Thames Embankment rather than in the Strand. He thought the Government ought to communicate with the Metropolitan Board upon the subject. He had reason to surmise that if such communication were made they would ascertain that they could get an ample and most convenient site by the side of the river on which a building worthy of the nation might be erected.

Mr. Clive obtained leave to bring in a bill to make better provision for facilitating and regulating the supply of pure water in cities, towns, and districts throughout the United Kingdom of Great Britain and Ireland.

On Friday last the Artisans' and Labourers' Dwellings' Bill was read a third time in the House of Commons. Some opposition is expected in the House of Lords, principally instigated, it is said, by the City of London.

Mr. Denman begged leave to ask what was the cause of the delay in completing the arrangements for the erection of the new courts and offices of justice, and what was the opinion of the law officers of the Crown upon the questions submitted to them relating to the legality of the choice of a design for such courts and offices.—The Chancellor of the Exchequer said that the delay had been caused by the length of time necessary for the Attorney-General to prepare his opinion. That opinion had just been received by the Treasury, but he had not yet seen it and did not know what course the Government intended taking in the matter.—Mr. Gladstone might be permitted to say a few words on this subject, as he was one of those who might be said to be in some sense responsible for the delay that had occurred. It appeared that none of the plans sent in combined all the requisites mentioned in the instructions, and the judges had asked to be permitted to make, not an award, but a suggestion, in order that the result might not be absolutely null. He would suggest that it was desirable for the Government to proceed without delay to determine who should be the architect, and that then the architect should take time to consider the plans in all their bearings.—Lord J. Manners said the expression of opinion by the Attorney-General had only just been received at the Treasury, and the Government had not yet had an opportunity of considering it. All he could say was that the subject should be at once considered in conjunction with the suggestion that had just been made.

On Tuesday evening Mr. B. Cochrane gave notice that on going into committee of supply he should call attention to the site of the new courts of law, and move that it is inexpedient to commence the building until further opinion has been taken as to the most desirable site for the purpose.

A meeting of the inhabitants of Tooting is about to be held for the purpose of resisting the attempt made to enclose the common.

WATER SUPPLY AND SANITARY MATTERS.

HAVING on Friday completed their inspection of the system of sewerage and other sanitary arrangements of Liverpool, the members of the Rivers Pollution Commission visited Birkenhead and the neighbourhood on Saturday last. The commissioners consisted of Colonel Sir William Denison, K.C.B., R.E., Dr. Edward Frankland, F.R.S., and Mr. John Chalmers Morton; Mr. J. S. Smith being their secretary. Yesterday they visited Tranmere to examine the waterworks, the sewer outlets, and other sanitary arrangements of that township.

The Tottenham Board of Health have been making experiments in the way of deodorising the sewage water of the district, and are hopeful with regard to the River Lea Conservancy Bill. The experiments consist of the application of a patented composition to the sewage water, which is said to precipitate the animal and vegetable matter held therein to the bottom.

The Inspector of Nuisances to the St. George's Vestry, Southwark, appeared before the magistrate a day or two since for an order to remove several poor persons attacked with fever from their lodgings in Brent's-court, High-street, to the workhouse. Applicant stated that a few days ago fever broke out in Brent's-court, which consists of a number of small houses densely populated with Irish families, there being as many as six and seven persons in each room. About a week ago one of them died in the Fever Hospital, and the relatives had the corpse brought back to No. 19, Brent's-court, for the "wake" to take place. It was kept there some days, and visited by scores of Irish, the result of which was an alarming spread of fever in the locality. Several were in a very bad state, and unless removed at once the calamity would be very serious. The magistrate granted the removal of the poor people, not, however, to the workhouse, but to the Fever Hospital.

Building Intelligence.

CHURCHES AND CHAPELS.

The foundation stone has been laid of a new Presbyterian Chapel at Carnone, Derry.

The foundation stone of a new church was laid last week at Cleadon, near Sunderland. It will be erected in the Early English style, and will consist of a chancel apsidal at the east end, nave, and vestry on the north side of the chancel. Mr. Johnson, of the firm of Austin and Johnson, Newcastle, is the architect, and Mr. Allison, of Whitburn, is the contractor.

The new parish church of Coxhoe, Durham, was consecrated last week by the bishop of the diocese. The style is Geometrical Decorated, and the building consists of a chancel, nave, vestry, and south porch. The materials used are Cassop stone and Whitby stone dressings externally, and Bath stone internally. The nave is 82ft. long by 28ft. in breadth; chancel, 28ft. by 24ft.; the nave walls being 20ft. high, and those of the chancel 18ft., while the pitch of the nave roof is 42ft. high. There is sitting accommodation for 458 persons. Mr. Withers, of London, is the architect, and Messrs. Dodgson and Simpson, of Stockton, were the contractors.

The foundation stone of a new Roman Catholic Church at Longton was laid on Tuesday week, by the Rev. Bishop Ullathorne. The building, which is designed by Mr. E. W. Pugin, is in the Early French Decorated style, and will be a parallelogram in form, consisting of a nave 138ft. long and 36ft. wide, and two aisles 110ft. by 14ft. The nave, which will terminate in a pentagonal apse, will be divided from the aisles by nine equilateral arches, rising on columns 17ft. high, and formed of red Mansfield and Painswick stone. The building will be of Staffordshire red brick, with Bath and Hollington stone dressings. The interior accommodation will be for 1,000 worshippers. Mr. G. Heveningham, of Wolverhampton, is the contractor. The total cost of the church when finished is expected to be between £8,000 and £9,000.

Bishop's Waltham Church was reopened last week, after restoration. The roof has been stripped of plaster, and the church has been repewed throughout. No architect was employed, the churchwardens superintending all the work.

A new church, dedicated to All Saints, was consecrated recently at Huddersfield, by the Bishop of Chester. The style of the building is Early Decorated. The plan is cruciform, with a tower 120ft. high at the south-west corner. The church consists of nave, transepts, organ chamber, chancel, and west porch. All the masonry is of local stone, with dressings of white ashlar from Stourton quarries. Sittings are provided for 460 persons. The cost of the building, exclusive of site, is £8,500. The architects were Messrs. Kirk and Sons, of Huddersfield and Dewsbury, and the contractors Messrs. Moorhouse, Bramley, and Co. Mr. B. Stocks, of Huddersfield, was the clerk of the works.

The Tabernacle at Bristol, founded in 1753 by George Whitfield, was reopened on Sunday last, after restoration, at a cost of £500. The building work was executed by Messrs. Foster, and the decoration by Mr. L. S. Allen, both of Bristol.

St. Mary's Church, Cowes, will be opened on Thursday, the 28th inst., having been almost entirely rebuilt. The style is Gothic, and the building was designed by Mr. Cates. It is built of white Swanage stone, with Bath stone window dressings and columns; the interior is of red, white, and black bricks harmoniously intermingled. The columns supporting the roof are of Portland stone. The cost of the work is about £5,000. Mr. George Wheeler, of Cowes, was the contractor.

A new United Presbyterian Church has been opened at Wooler, N.B. The style of architecture is the Early English or Decorated. The building is designed to accommodate 450 adults. The estimated cost is £1,200. The church was designed by Mr. William Grey, Berwick.

Arrangements are nearly completed for the restoration of the old High Church of Stirling. It is intended to restore the whole fabric according to the style and character of the restorations so successfully effected in the cases of Glasgow Cathedral and Paisley Abbey.

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting (the last but two for the present session) on Monday, the Right Hon. the Earl of Romney in the chair. Grants of money amounting to £1,270 were made in aid of building new churches. A special jubilee choral festival service was held in the nave of Westminster Abbey on Ascension-day, when a sermon was preached by the Very Rev. the Dean of Westminster in aid of the society's funds.

The foundation stone of a new United Presbyterian Church was laid at Dublin on the 6th inst. The style of the building is Geometrical Gothic, and it will be built of granite, with dressings of limestone and freestone, at a cost of £4,500. The building consists of nave 70ft. by 28ft. clear, and two side aisles. A tower and spire 110ft. high will rise at the north-west angle. Mr. W. Fogerty, of Dublin, is the architect, and Messrs. Crowe and Sons the builders.

The foundation stone of a new small Independent Chapel was laid at Scaldwell. The style is Gothic, and it will be built of brick with Bath stone dressings. Mr. Holt, of Cottesbrooke, is the architect, and Messrs. Keighley and Everard the builders.

The Bishop of Peterborough consecrated a new church at Wellingborough on Friday, the erection of which had been considerably delayed in consequence of the falling in of the south arcade in May last, whilst in the course of being built. The church, which is severe Early English, cost £4,000, and consists of a nave with north and south aisles, an apsidal chancel, and a south chancel aisle containing the vestry and an organ-chamber. The seats are open and afford accommodation for 500 persons. The architect is Mr. C. Buckeridge.

On Thursday week the ceremony of laying a memorial stone for a chapel for the New Connexion Methodists in Stockton took place. The building will be of red brick, and the cost about £1,500. The architect is Mr. W. Hill, of Leeds, and the contractor Mr. John Craggs, of Stockton.

BUILDINGS.

It is intended to erect a new workhouse for the Huddersfield district.

We see that it is intended to build new warehouses and offices opposite the railway station, Huddersfield, and that Mr. W. H. Crossland, of Leeds, has been selected; Mr. J. W. Ramsden is the architect, who has invited tenders.

The following resolution has been passed by the Halifax Town Council:—"That it be an instruction to the Finance Committee to obtain a design and estimates for reconstructing the tower of the Townhall in accordance with the original intention of Sir Charles Barry." Mr. F. A. Leyland has written to the *Halifax Courier* on the subject, and strongly criticises and condemns Sir C. Barry's design, or rather designs.

It is intended to erect a new hotel in Belfast, which is to cost £25,000. It is to be done by a company called the Ulster Hotel Company (limited).

The works of the new station at the junction of the London and South-Western with the Charing Cross line have been commenced. This station will be erected by the South-Eastern Company, and is designed for the accommodation of the South-Western travellers and the population of the Lambeth district. The station will have three platforms available for passengers desiring to proceed to Charing Cross or Cannon-street. They will be nearly 500ft. long and ample in width.

On Monday the London and North-Western Railway Company opened their new goods station at Broad-street, and thus made an important addition to the means of transport for the enormous local trade of the City. There are four entrances to the new station, and the route promises to be a great convenience to the numerous houses having connections on the London and North-Western system of railways.

The Vestry of St. Mary, Islington, accepted tenders for the alteration to the bridge over the Regent's Canal, Caledonian-road, last Friday, and decided in favour of Mr. William Jay, who tendered to do the whole work for £2,429. The new bridge is to be 40ft. span, with a wrought-iron top with 14in. parapet walls resting on the outside girders. The new width of roadway will be 30ft., with 7ft. footways on each side, thus giving a clear width, wall to wall, of 44ft., being 11ft. 9in. more than the old width. Mr. John A. Clements, C.E., who is also the surveyor to the western district, is the engineer.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—J. G. B.—J. W. W.—J. M.—E. S., with photographs.—W. R. S., with photographs of plans of Manchester New Townhall.—G. T. R.—E. W. P.—T. A.—T. W.—E. W. G.—I. C.—I. R.—G. T. R.—R. P. E.—I. H.—W. H. W.—T. J. V.—A. G. H.—E. S.—I. R. B.—E. C.—C. S. M.—W. S.—W. P.—P. B.—C. F.—E. B.—J. B.—N. M'C.—D. H. and J. N.—JOHN JACKSON, advertise.

J. R. T.—Kentish rag, though used extensively in London and elsewhere, is not used internally, because it sweats; or, in other words, it does not absorb condensed moisture.

J. M.—The illustrations spoken of did not appear in the BUILDING NEWS.

ENQUIRER.—See reply 855 in present impression.

Correspondence.

UTILISATION OF WASTE HEAT.

TO THE EDITOR OF THE "BUILDING NEWS."

SIR,—I have been very much surprised to observe by the BUILDING NEWS that Mr. Mathews, honorary secretary to the Architectural Association, has, on two occasions within the last few weeks, brought before the members certain suggestions which had "occurred to him" for utilising the waste heat from a kitchen fireplace for the purpose of warming upper rooms. I beg leave to ask Mr. Mathews by what right he brings forward as a scheme of his own a proposition suggested by me four years ago in my first publication, and fully discussed in my last book, "Ventilation and Heat." I am bound to suppose that Mr. Mathews was acquainted with my propositions. They were described by you in your notice of my book, January 3, 1868. I sent a copy of my book to the Architectural Association, which was acknowledged by Mr. Mathews on the 20th of the same month, and three weeks later he brought forward my leading proposition as if it emanated from himself, and, in the discussion reported last week, it was not to him but to the president that I was indebted for a mention of my publication. Such conduct is ungracious and unjust. It does not appear, from the discussion, that either of the

speakers was familiar with the indispensable conditions requisite for giving the system whatever success it might be susceptible of. That the system could be made a success, and a very decided one, there can, I believe, be no doubt whatever. If gross mistakes were made, there would of course be an entire failure. I have described many of the conditions, and hope I may have some opportunity to carry out the system on a considerable scale. I will then take the most suitable means of giving full publicity to the results, and the means of obtaining them.—I am, &c.,

FRED. EDWARDS, Jun.

Great Marlborough-street.

Intercommunication.

QUESTIONS.

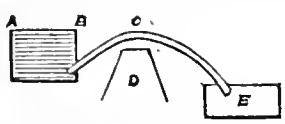
[862.]—GLUE.—Can anyone inform me if there is any glue used for woodwork that will withstand damp? In your article on "Continental Joinery," some time ago, you speak of Messrs. Ekman, of Stockholm, employing fish glue for their door panels, and which, when immersed for several hours in water, did not break at the joint. Is this ordinary fish glue, obtainable in shops at 10d. per lb.? Perhaps you know the mode of preparation.—G. F.

[863.]—COLOURING PERSPECTIVES.—Can anyone inform me where I can receive lessons in colouring perspectives at moderate terms in London?—DRAUGHTSMAN.

[864.]—POLISHED GRANITE.—Will any of your readers inform me of the best method of getting the best polish on red Scotch granite?—HARD STONE.

[865.]—THEORY OF PUMPS.—Will the gentleman writing the above-named article give me his idea how high water can be raised from a river by means of a 3in. syphon, and the best method of applying it to filling a tank.—M.

[It must be borne in mind that water cannot be raised by means of a syphon unless the level of the source of supply is higher than the top of the bend of the syphon, as represented in the annexed sketch. Let A B be the level of the source



of supply, and D an embankment over which it is required to raise the water into any place E. The condition of the proper acting of the syphon is that the level of the water A B shall be always about 2ft. higher than C. If the task mentioned by "M." be higher than the surface of the river he proposes to get his water from, the syphon can do nothing for him.—THE WRITER OF THE ARTICLE.]

[866.]—FLINT WALLS.—I have recently built a flint wall, and find, to my sorrow, that it is already so bulged that I must take it down. Possibly, I have left something undone which I should have done. A hint or two from an experienced hand on the best mode of building flint walls would be thankfully received by—J. R. B.

[867.]—SCHOOL OF DESIGN.—Could you or any of your readers inform me where the best school of design is situated, either in the E.C. district or nearest to it; of the terms of attendance in the evenings; and upon what evenings the school is open for instruction?—WANSTEAD

[868.]—ENTASIS OF COLUMNS.—Can any of your readers kindly supply the proper method of finding and setting out the entasis of the shafts of columns? Or can anyone inform me of the best work upon the practice of the five orders?—J. P. O.

REPLIES.

[839.]—CONSTANT FOR GIRDERS.—The proper constants for girders will depend upon the description to which they belong. When the section is the solid rolled one mentioned by "J," and shown in fig. 1, the constant may

FIG. 1.

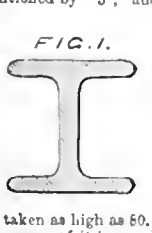


FIG. 2.

be taken as high as 80. This value is given to it because by reason of it being all in one piece, it is supposed to be secured against weakness by lateral deflection, or yielding of the middle part or "web," as it is technically termed. If we now consider what is known as a "built up" girder, that is, one made of a vertical plate or rib joined to a couple of horizontal upper and lower plates by two pairs of connecting angle irons, and represented in fig. 2, the constant cannot be taken higher than 75, as the thin wrought iron rib in a girder of a depth exceeding 3ft. requires to be secured against lateral weakness by stiffening irons or longitudinal stripe of angle or T iron riveted on to it. Should the "web" be of open or lattice bars instead of a solid plate, the constant should not be taken higher than 72, unless by one well experienced in designing girders, and who is able to compensate by skilful bracing for the comparative absence of partial rigidity.—DESIGN.

[840.]—STONE PIPES AND FROST.—Allow me to inform your correspondent that if his pipe were to be quite full of water, and the water were to freeze, it would certainly burst; but, as this could hardly happen, the water in a down pipe always being in motion, there is no fear of such a contingency. I should be inclined to omit the leaden lining, the more especially as leaden pipes are those which burst oftenest during a severe winter.—I. P. D.

[842.]—DRAIN TRAPS.—Having taken the greater part in producing Antill's Improved Stench Traps, I am naturally interested in their success, and beg to offer one or two remarks in answer to "Mr. Kirkby" and "A. W." in your last impression. That they are a modification of the D trap there can be no question, and well adapted to replace the bell and all others in places where room is limited; but whether they are as effectual as can be desired must be left to time and experience. It has been an anxious question in fixing the prices; and they have been submitted to architects, builders, and plumbers, and the general answer has been that they are not too high. Anyone acquainted with the price of metals and cost of workmanship knows full well their value, and that many thousands must be sold before any return can cover our preliminary expenses. I would here remark that, although the principle of the traps is simple, it is not so to make. No doubt the difficulties may be simplified in time to come. Should the experiments in iron be successful, they will then be at such a price as will bring them into use in all classes of buildings.—R. ANTILL.

[848.]—THEODOLITE.—For a beginner to learn the adjustments and the general use of the theodolite, there is not a better little work than the number in Weale's Series, "Mathematical Instruments," by Mr. Heather. I imagine, however, that "E. M. S." refers to the use of the theodolite in connection with surveying, setting out work, &c. He will find abundant information in "Baker's Surveying and Levelling," also one of Weale's Series; "Williams's Practical Geodesy," a most excellent work; "Mr. Haskoll's Land and Marine Surveying," reviewed in our columns of the 15th inst.; and, in fact, in almost every modern work upon surveying and civil engineering.—ASSISTANT ENGINEER.

[849.]—IRON AND WOOD GIRDERS.—There is no such work to which your correspondent alludes, but he will find everything required to be known about wood girders in "Barlow's Strength of Materials;" about cast-iron girders in Mr. Hodgkinson's work; and about wrought-iron ones in Mr. Fairbairn's "Application of Cast and Wrought Iron to the Purposes of Construction."—S. S.

[853.]—GOLD LETTERING ON MARBLE.—"A. A." will find the following a useful mixture for his purpose:—In half a pint of hot turpentine dissolve 2½oz. of gum dama and 1½oz. of best white wax; when cold, give the letters one or two coats of this, allowing a day between each coat to dry; then gild with double thickness gold leaf in the usual manner. It will not crack either indoors or exposed to the weather.—T. K.

[855.]—DAMP BRICKWORK.—If A. B. C. D. will apply two good coats of Ransome's Patent Liquid Glass to surface of his brickwork he will find it do all he wants. It is most effective in preventing the damp from penetrating through the wall, and will not discolour the bricks.—E. HONEY, 22, Trinity-street, Bristol.

[855.]—To make brick or stone walls impervious to wet, wash the walls with a hot solution of ¼lb. of mottled or soft soap in a gallon of water, laid evenly with a brush. As soon as this is dry, another coat, composed of ½lb. of alum thoroughly dissolved in three gallons of water. Fair weather should be selected for the work. Porous bricks have been effectively weathered by this process.—W. R. A.

[856.]—CORROSION OF LEAD PIPES.—If the lead pipes are laid in common drain pipes the latter will protect the lead pipes from being eaten away by the action of the earth. I presume your correspondent is correct in stating that the cause is not the chemical action of the water.—W. R. A.

[857.]—TO CLEANSE OLD STONEWORK.—Old whitewash may be readily cleaned off walls by scrubbing with water and sand, being previously acidulated with .04 of hydrochloric acid. The commonest acid will do, sold at about 2d. per pound.—W. R. ATKINSON, Uckfield.

WAGES MOVEMENT.

The stonemasons' strike at Birmingham still continues, and there is no probability of any satisfactory settlement of the dispute at present. The masters are equally determined with the men not to yield, and in order to enable them to proceed with their work, they will endeavour to obtain the services of men from other towns.

The bricklayers' strike at Liverpool is still going on. Some men have been obtained from London, and active steps are being taken with the view of getting more.

The masons of Coventry have demanded an increase of wages and the Saturday half-holiday. Steps are being taken to call a meeting of the masters to consider the matter as early as convenient.

STATUES, MEMORIALS, ETC.

The Common Council of London propose to erect a statue to Mr. Peabody, near the Royal Exchange.

About a year ago the New York exec[illegible] committee of the Shakespeare Monument Fund selected a design out of several models which had been submitted to them. It is now completed, and is to be subjected to the approval of the general committee on the 25th inst. The statue is expected to be finished and erected in Central Park, upon the foundation, where its corner stone was laid four years since, on the 23d of April, 1869.

The memorial statue of Sir Peter Fairbairn was inaugurated on Thursday week at Leeds. The statue has been erected by public subscription, and was executed by Mr Noble, at a cost of £1,000. It is of bronze, about 8ft. 6in. in height, and rests upon a 10ft. pedestal of Peterhead granite.

Dr. Kinglake, the donor of the Taunton High Cross, has decided to place statues in the six vacant niches.

On Wednesday week the Bishop of Sodor and Man, acting for the Bishop of Salisbury, consecrated the church of Pukeswell, near Weymouth, which has been rebuilt. It consists of an Early English chancel, nave with north and south transepts, circular tower with spire at the west end, porch on the north of the nave, and vestry on the south of the chancel; and the dimensions are, measuring within the walls, 86ft. from east to west, and 51½ft. from north to south; while the spire reaches an altitude of 90ft., the roof of the chancel and nave, which are of the same height, 40ft. The east window is by Clayton and Bell, and there is also a painted window over the font, which is in the tower. The architect is Mr. G. Evans.

BUILDING AND LAND SOCIETIES.

The seventeenth annual meeting of the Oxford and Abingdon Building Society was recently held at Oxford, Mr. Alderman Hughes in the chair. The report, which was adopted, proved that a larger amount of business had been transacted than in any previous year, and all of the most satisfactory character. A bonus of £25 was recommended on all shares arriving at maturity between March 31, 1868, and March 31, 1869. Certain alterations were made in the rules of the society, and the retiring directors having been re elected the meeting closed.

LEGAL INTELLIGENCE.

IMPORTANT DECISION.—Some time ago, says the *Scotsman*, the road trustees for the county of Berkshire contracted with Mr. John Dickson, Galashiels, for the building of a bridge over Bowmont Water, near Yetholm. It was a condition that the contractor was bound to uphold the bridge for one year. When finished the work was taken off Dickson's hands by the trustees' inspector as finished in terms of the contract. In a few days afterwards the bridge was carried away by a flood, and the trustees sued the builder for its re-erection. Proof was laid before the sheriff by both parties, and it was contended for the builder that the plan was faulty, and that he was not to blame. The sheriff has given effect to this plea.

SURVEYORS' CLAIMS.—OWEN *v.* REVEL.—The plaintiff is a surveyor at Bournemouth, and the defendant was lately inspector of nuisances at Bournemouth, at which time some houses were built by him. The claim was in the Christchurch County Court for £20 9s. 11d., of which defendant admitted £11 10s. 11d., and disputed £9, made up of two items, one of £5 and the other of £4, for superintendence of work, and for measuring out two sets of cottages. Defendant admitted the order for measuring, but still disputed the superintendence, and the matter then in dispute was £6.—Evidence was called by the defendant, after plaintiff had stated his case, to prove that no superintendence by plaintiff had taken place while the work was in progress, and his Honour gave judgment for plaintiff for £14 19s. 11d., and ordered payment forthwith.

NOTICES OF PUBLICATIONS.

TERRA-COTTA.—Parts 3 and 4. By J. M. BLASHFIELD. Stamford.

MR. BLASHFIELD has issued two other parts of his work on terra-cotta. Parts 3 and 4 illustrate a great variety of uses for this material in connection with brick domestic architecture, including doorways, windows, balconies, consoles, copings, plinths, monograms, panels, &c. "For this class of work," says the author, "terra-cotta is not always cheaper than Bath stone or other easily wrought oolites, but for such purposes it is far cleaner and more durable than stone."

GLEANINGS FROM FRENCH GARDENS. By W. ROBINSON, F.L.S. London: Warne and Co. 1868.

THIS is a work on French horticulture and gardening. The author went to France in 1867 with a view to study the horticulture of the country as far as possible while continuing his connection with the horticultural press in this country. A correspondence having resulted, the author was induced to write this book. It contains many illustrations, and will be found to be a useful book to all interested in horticultural pursuits.

A CATALOGUE OF THE BOOKS, MANUSCRIPTS, WORKS OF ART, ANTIQUITIES, AND RELICS ILLUSTRATIVE OF THE LIFE OF SHAKSPEARE. London. 1868.

THE Shakspeare Fund was established in 1861, and among the objects contemplated was the erection and endowment of a public library and museum at Stratford-on-Avon, the contents of which are described in this catalogue. The permanency of this important collection has been carefully secured. The library and museum have been conveyed to the corporation of Stratford-on-Avon upon trust to place their management under the control of a board. The catalogue has been

compiled by Mr. Clarence Hopper. All who are interested in the life and labours of the great poet, and their name is legion, will find much to amuse and instruct in this museum.

THE SOCIAL CONDITION OF THE WORKING CLASSES. By the Author of "The Autobiography of a Beggar Boy." London: Heywood and Co.

THIS book glances at the history of social and political progress for the last fifty years. It is evidently written by one who joined in the struggles for political and social freedom. It treats in the ordinary cheap newspaper style of strikes, and condemns them emphatically. It shows that no combination of men can keep up the value of labour beyond its power to remunerate the capitalist. The author gives a good deal of healthy advice to working men. But it will be found in the long run that working men, like other people, will only buy wisdom by experience. When they find that strikes do not and cannot permanently better their condition, strikes will be abandoned.

MEETINGS FOR THE ENSUING WEEK.

TUES.—Institution of Civil Engineers.—The annual Conversazione, 9.

SAT.—Associated Arts Institute.—Exhibition of sketches—subject, "Signs of the Times"

Our Office Table.

The committee of the Working Men's Club and Institute Union has completed arrangements for the delivery of two courses of lectures on the value of science in relation to industrial pursuits, at the London Mechanics' Institution, Southampton-buildings. Professor Kerr, F.R.I.B.A. (of King's College), opens the first series to-day, and he will be followed on Tuesdays and Fridays by Mr. James Robertson, Dr. J. H. Gladstone, F.R.S., F.C.S., Dr. F. Crace Calvert, F.R.S., Dr. W. B. Carpenter, F.R.S., Mr. E. J. Reed (Chief Constructor of the Navy), Professor Warrington Smyth, and Dr. E. Lankester, F.R.S.

At the closing business meeting for the present session of the Institution of Civil Engineers, held on Tuesday last, Mr. Charles Hutton Gregory, President, in the chair, nine candidates were balloted for and duly elected, including, as Members:—Mr. Thomas Login, F.R.S.E., Executive Engineer of the 1st Class in the P.W.D. of the Government of India; Mr. William Teasdel, Resident Engineer, Great Yarmouth Port and Haven; and Mr. Edward Williams, General Manager of the Mines, Collieries, and Iron Works of Messrs. Bolckow, Vaughan, and Co., Middlesborough; and as Associates—Mr. Henry Samuel Ellis, Exeter; Mr. Charles Higgins, surveyor, Islington; Mr. William Hurst, Paddington; Mr. Samuel Joseph Mackie, Bayswater; Mr. John Palmer Smythies, assistant engineer, Furness and Midland Railway; and Mr. Arthur John Whalley, Montevideo. It was announced that Mr. Nicholas Charles Szerelmey had been admitted a student.

The First Commissioner of Works having removed the pump in Park-lane, opposite Pitt's Head Mews, the Vestry of St. George's have unanimously passed a resolution requesting him to restore it.

Mr. Abbott's plan for the drainage of Regent-street has been adopted to the exclusion of plans submitted by Mr. Bazalgette and Mr. Howell.

A correspondent wants to know why private carriages are not allowed to drive up Constitution-hill; and he asks, Is there a capital in Europe where the use of such a thoroughfare should be restricted to a small number of favoured courtiers, who have the exclusive right to drive there?

The demand for houses in the new undertaking of the United Land Company has been already so great that the directors have fixed the early date of June 6 for the receipt of applications for shares. This success of the company is naturally to be ascribed to its co-operation with the long-existing and prosperous Conservative Land Society, and to the fact that the executive committee and officials, with some additions to the company, are nearly all the same as those who originally commenced operations in the purchase of estates in the gross, and the sale of them in plots in detail in 1852.

At the meeting of the Metropolitan Board of Works on Friday last, a report was presented on the proposals of the Metropolitan District Railway as to the construction of a solid embankment between the Temple and Blackfriars Bridge. A provisional agreement had been entered into for the construction of a solid embankment with a 100ft. roadway thereon from the Temple Gardens to Blackfriars Bridge, and the company to construct their railway within the embankment; the railway company to commence their works for the construction of the railway on the embankment from Westminster Bridge to the Temple on July 1 next, and the other works to be carried on simultaneously with the works of the Board. The railway company to deposit £40,000 on July 1 next; the payment of the £200,000 to be paid to the Board to be spread over three years. The report was adopted, and fresh tenders will be advertised for.

Mr. F. T. Palgrave, in a lecture before the Royal Institution a fortnight since on "Good Taste in Art," said that independently of the individual artiality of every observer for particular works of art, there is such a thing as good taste, governed by fixed laws, and dependent upon accurate knowledge. Among the things which ordinary observers and inferior artists often overlook were "the laws of material." In sculpture, for instance, he said that marble is only suited for works of repose, whilst bronze, being a lighter material, and of more tenacity, is suitable for works of activity.

A process for gilding is published in the Bulletin of the Société d'Encouragement. The articles are first electro-gilded in the ordinary way. An alloy of gold and quicksilver is afterwards deposited from a solution of the cyanides of the two metals. When this coating is sufficiently thick, it is done over with a paste formed of borax, with some additional boracic acid and sal-ammoniac. It is then placed in a fire until the paste is calcined, and afterwards in a bath of acidulated water. By this process a surface of gold is obtained in just the same state as by the old water-gilding process, without any risk to the health of the workmen, and it may be burnished or left dull as desired.

There is no doubt that some effort should be made to introduce an improved lamp for the streets. As a move in this direction, the St. George's vestry, Hanover-square, desirous of obtaining a more ornamental lamp, invited specimens to be sent them, but they were too dear for use. The surveyor, however, was ordered to advertise for designs and specimens.

In a paper lately read before the Birmingham Architectural Society by Mr. J. R. Veall, architect, of Wolverhampton, on "The Village Church," the following occurs:—I must, however, mention an ancient office which still exists, *i.e.*, the dog whipper, whom in some village churches it used to be necessary to appoint. At Trysull, near Wolverhampton, John Rudge, by his will, gave 5s. a quarter to a poor man to go about the parish church during sermon to keep people awake (rather a poor compliment to the clergyman) and keep dogs out of church. The sum is still paid for that purpose. Richard Dovey, of Farncote, Shropshire, in the year 1659, left 8s. per annum to some poor man of the parish of Claverley who should undertake to awaken sleepers and whip dogs from the church; 10s. per annum is still paid for that purpose. In one of the Lincolnshire village churches, a short time since, I counted no fewer than five sheep dogs present during Divine service. I could not ascertain, however, that a dog whipper had ever held office.

It appears that St. Bartholomew's Hospital possesses a farm, and that a slice of it is about to be sold to a railway company. This portion of the farm now yields the hospital about £100 a year, and Mr. Foster White stated, on Saturday last, that the railway company will give £45,000 for the said slice.

Our attention has been called to the plans submitted for the Manchester New Townhall, by Corson and Aitken, of Manchester, and we must say they very closely resemble the plans of Mr. Waterhouse. As Mr. Waterhouse's plans have been very justly praised the question very naturally arises, how is it that other plans so much like them were not admitted into the privileged circle of eight by the referee and the committee. We ask this without for a moment wishing to impugn the final verdict.

The guardians of the Holborn Union have been making an experiment on the relative economical merits of stone breaking and oakum picking. After spending £50 in stone and £5 in hammers, they cannot find purchasers for the stone. For picked oakum they found a ready sale at 2s. 6d. per cwt. We cannot imagine, however, why there should not be a demand for broken stone in London, where so much is consumed.

The President of the Royal Academy has announced that the next exhibition of the Academy will be held in its new home, and though all the space at their disposal would not then be accessible, still they would have room for 1,500 pictures, whereas now they had only room for 900.

The Rev. W. Morley Punshon, in a letter from the United States, describes the opening of a new Methodist Episcopal church in Williamsburg, a suburb of New York, on the Brooklyn side. There were several features in the building which struck him as novelties. Immediately in front was a table for the reporter; to the right of the tribune a pedestal, on which was a very beautiful bouquet of flowers. The church was lighted like the British House of Commons, and the rays, streaming through coloured glass, fell with a softened lustre which was cheerful without being dazzling. The total cost of the church was 200,000 dollars, or about £40,000. On the basement is a large, cheerful room, superbly furnished with carpets, mirrors, piano, &c., which is called "the church parlour," and which is the common property of the members. This "church parlour" appears to be fast becoming one of the institutions of American Methodism. Surely somebody might introduce something similar into our City churches. It would be a capital place to adjourn to during the sermon.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3047 W. BISHOP AND B. BURNINGHAM. IMPROVEMENTS IN APPARATUS FOR PREVENTING EFFLUVIA ENTERING TANKS OR CISTERNS FROM THE WASTE-PIPE. Dated October 29, 1867.

This invention relates to a means of preventing the admission of effluvia from drains entering cisterns by the waste-pipe, as is commonly the case, and consists in the application of a lift-valve fitting in a socket let into the bottom of the cistern or tank, which socket communicates with a pipe for carrying away the surplus water to the closet or drain. The valve stem passes up through a bridge-piece and guide attached to the socket, a tube being fixed on the neck of this guide supporting a float at the height to which the water is to rise. This float is connected to the valve stem by means of a rod or chain passing down through the said tube, the length of the rod or chain being regulated as desired by means of a nut and screw passing through the float.—Patent completed.

Trade News.

TENDERS.

The Bethnal Green Board of Guardians have accepted the tender of Mr. Whitford, for the erection of an iron house at Leytonstone, for the temporary accommodation of the children shortly to be removed from Hanwell School. Amount, £1,176.

AYLSHAM.—Mr. Editor,—The following are specimens of estimates given for the erection of a Primitive Methodist Chapel at Burgh, near Aylsham, Norfolk. What think you of the differences? The chapel to seat 150; bricks and lime supplied; plans and specification provided by committee.—Yours, &c., A CONSTANT READER.

Saul	£255
Wilson	161
Burrell and Tuddenham	157
Bartram	146
Thace	130
Gaze	123
Buck	98
Hewits	79

BOUND'S GREEN.—For house at Bound's Green, for C. F. Francis, Esq. A Rowland Barker, architect:—

Brown	£1110
Linzell	995
Stringer	986
Pocock	845
Scrivener and Co.	824

HAMMERSMITH.—For the erection of five cottages near the Cornwall road. Mr. John G. Hall, 6, Cornwall road, architect. Quantities not supplied:—

			For drain to Cornwall Road.		Extra for wheeling down lane.		Total.	
	£	s.	£		£		£	s.
J. Beagley	1049	0	41		10		1100	0
Chamberlen Bros.	1025	0	30		10		1065	0
J. & F. Raynham	875	10	24		25		924	10

CRANFORD.—For sewerage works at Cranford, Middlesex. Mr. Charles Innes, architect. Second contract:—

Thirsk and Co.	£777
Lodge	760
Mann	745
Crockett	724
Adamson and Sons	629

EGHAM.—For the erection of boys' and girls' schools and teachers' residences at Egham, in the county of Surrey, for the trustees of the Poor Allotments Fund. C. H. Howell, architect, 3, Lancaster-place, W. C. Quantities not supplied:—

Reveall, Windsor	£1865	Approach	£120
Simpson, Egham	1540	,,	80
Oades	1399	,,	48

FULHAM.—For Sir John Powell's almshouses. Mr. J. P. Seddon, architect:—

Belham	£7200
Hall	5948
Grover	4359
Williams and Co.	4126
Muspratt	4106
Pitts and Son	4060
Aviss and Son	3950
Perkins	3640
Henderson	3618
Wigmore (accepted)	3368
Lacey and Co.	2490

LONDON.—For four warehouses, Monkwell-street, Wood-street, E.C. Herbert Ford, architect. Quantities supplied by Messrs. Hovenden and Heath:—

Asbby and Sons	£10,655
Conder and Sons	10,632
Lawrence and Sons	10,532
Piper and Wheeler	10,500
Turner and Sons	10,470
Myers and Son	10,443
King and Sons	10,360
Crabb and Vaughan	10,296
Mann	10,175
Pritchard	10,154
Henshaw	9,985
Browne and Robinson	9,879
Brass	9,747
Webb and Sons	9,684

LONDON.—For alterations and repairs at the "Prince of Brunswick Inn," Brunswick street, Blackfriars, for Mr. H. G. Stranger. Mr. D. Haylock, architect, Wandsworth:—

Mills	£546
Winterton	545
Stone	522
Harrington	516
Langmead and Way (accepted)	498

LONDON.—For the erection of five warehouses, Finsbury-street, E.C. Mr. Wimble, architect:—

Patman and Fotheringham	£9985
Keeble	9823
Hart	9650
Wills	9549
Newman and Mann	9486
Turner and Sons	9469
Webb and Sons	9466

Kelly Brothers	9271
Abraham	8987
Perry	8987
Scrivener and White	8910
Henshaw	8560
Mortar	8123

LONDON.—For rebuilding Her Majesty's Theatre, in the Haymarket. The quantities were furnished:—

Smith and Taylor	£35,674
Cubitt	35,318
Myers	31,586
T'Anson	29,960
Piper and Wheeler	29,500
Holland and Hannen	28,439
Trollope	27,767
Foster	26,770*

The above do not include the stage, machinery, fittings, fixtures, gas-fittings, fire mains, warming, and decorations; but they include all iron work.

* We believe the above is not a complete list of the tenders.

NORTHAMPTON.—For new schoolrooms, vestries, &c., Commercial street Chapel, Northampton. Mr. T. Heygate Vernon, architect. Quantities supplied by Messrs. Mann and Saunders:—

Berrill	£1399
Redshaw	1384
Marsh	1350
Watkins	1200
Hall	1124
Smith Brothers	1116
Clarke and Heap	1000
Cosford and Emery (accepted)	1090
Chappell	974

SHEPHERD'S BUSH.—For residence at Shepherd's Bush, for Thomas Elborough, Esq. Mr. Charles Bradley, architect, 24, Nottingham-street, St. Marylebone:—

Haward Brothers	£2215
Tubb	1845
Longwire and Burge (accepted)	1697

SOUTHSEA.—For finishing two houses in Granada road, Southsea. Archibald D. Dawnay, architect:—

	With pointed fronts.	With bay windows.	Outbuildings.

Drummond (accepted)	223 8 6
Harrison	210 0 0
Cole	199 10 0
Porter	195 0 0
T. Lawrence	186 0 0
Beales	176 0 0

WALTHAMSTOW (ESSEX).—For a house for Mr. D. T. Morgan. Mr. John T. Bressey, architect:—

Arber	£2478
Rivett	2293
Mundy and Hutchinson	2266
Piper and Wheeler	2190
Perry and Co	2135
Reed	1941

PROPERTY SALES.

AT THE MART.—By Messrs. Norton, Trist, Watney, and Co.—Freehold plot of building land fronting Clarendon-road, Watford, Herts—sold for £450.

Life interest of a person aged 57 years, in a freehold and leasehold property known as Goose Rye Farm, Guildford, Surrey, consisting of two cottages, buildings, and 23 acres of land, let at £42 per annum—£150.

Freehold warehouse, No. 4, Elm-street, Gray's Inn-road, let on lease at £80 per annum—£1,770.

Freehold house, No. 45, Hyde road, Hoxton, let at £22 per annum—£340.

Freehold house, No. 47, Hyde-road, Hoxton, let at £20 per annum—£450

Freehold building estate, containing about 31 acres, situate in the parishes of Tooting and Streatham, in 16 lots, viz.:—Lot 1, £600; lot 2, £600; lot 3, £520; lot 4, £430; lot 5, £460; lot 6, £460; lot 7, £460; lot 8, £370; lot 9, £510; lot 10, £1,050; lot 11, £850; lot 12, £800; lot 13, £840; lot 14, £500; lot 15, £1,350; lot 16, £2,500.

By Mr. Robert Reid.—Leasehold residence, No. 148, Camden-street, Camden Town, let at £49 per annum, term 42 years unexpired at £7 9s. per annum—£500.

Leasehold improved ground rents, amounting to £108 14s. per annum, for 53¾ years, secured upon premises at Camden Town, in 11 lots, as follows:—Lot 1, ground rent of £10 10s. per annum, £170; lot 2, ground rent of £12 12s., £220; lot 3, ground rent of £10 10s., £190; lot 4, ground rent of £10 10s., £190; lot 5, ground rent of £10 10s., £170; lot 6, ground rent of £12, £215; lot 7, ground rent of £11 18s., £200; lot 8, ground rent of £8, £135; lot 9, ground rent of £4 4s., £95; lot 10, ground rent of £5, £115; lot 11 ground rent of £10, £170.

Leasehold three houses, Nos. 22 to 24, Union-street, Lambeth, producing £88 per annum, and a ground rent of £5 per annum, secured on No 21, Union-street, term eight years unexpired at £18 18s. per annum—£225.

Leasehold four houses (two with shops), Nos. 16 to 18, and 18A, Victoria-terrace, St. John's-wood, and a ground rent secured on No. 15, producing £161 per annum, term 47 years unexpired at £20 per annum—£1,375.

Leasehold stabling, granary, counting-house, dwelling, and premises, No. 24, Little Chester-street, Grosvenor-place, annual value £120, term 39 years unexpired at £45 per annum—£800.

Leasehold house, No. 34, Bayham-street, Camden Town, term 21½ years unexpired, at a peppercorn—£405.

By Mr. Frank Lewis.—Absolute reversion to two fifth shares of £2,723 13s. 10d. three per cent. consols; also of £400 secured by mortgage of a house at Portsea, receivable on the death of a gentleman aged 59 years—£530.

Leasehold residence, known as Kent Villa, Grange road, Dalston, let at £35 per annum, term 90 years from 1856, at £5 per annum—£350.

May 11.

By Mr. Whittingham.—Freehold mansion, known as Bromley House, High street, Bromley, with stabling, outbuildings, and land, 1a. 1r. 32p.—£3,300.

Freehold building land, situate in High-street, Bromley, in 24 lots.—Lot 2, £230; lot 3, £185; lot 4, £185; lot 5, £185; lot 6, £190; lot 7, £265; lot 8, £110; lot 9, £110; lot 10, £110; lot 11, £110; lot 12, £110; lot 13, £110; lot 14, £100; lot 15, £100; lots 17 to 25, £100 each.

Freehold building land, situate in the Moffat road, Beulah Spa, Norwood, in 48 lots, as follows:—Lots 1 to 163 comprised previous sales; lot 164, £72; lots 165 to 170, £40 each; lots 172 to 175, £37 each; lot 177, £35; lots 178 and 179, £34 each; lots 184 to 186, £37 each; lot 187, £85; lot 188, £86; lots 189 to 192, £32 each; lots 193 to 199, £31 each; lots 203 to 206, £30 each; lots 209 to 210, £41 each; lot 211, £100.

By Mr. G. R. Noble.—Copyhold 3a. 2r. 21p. of land, situate at Woodford, Essex—£735.

Freehold two houses, with shops, and twelve cottages, situate as above—£900.

May 12.

By Messrs. Farebrother, Clarke, and Co.—Freehold residence with stabling, pleasure grounds, and paddock of 4a. 2r. 32p., known as the "Chestnuts," Walton-on-Thames, Surrey, let on lease at £75 per annum—£2,550.

Freehold residence, with stabling, outbuildings, small farmery, pleasure grounds, and park like lands, containing 17a. 2r. 35p., known as Elm Grove, Walton-on-Thames—£7,230.

Freehold 8a. 3r. 8sp. of building land, situate as above—£4,000.

Freehold two cottages let at £13 per annum, situate as above—£400.

Freehold two cottages, let at £13 per annum, situate as above—£520.

Freehold cottage, let at £12 per annum, situate as above—£440.

Freehold estate, situate at Walton-on Thames, known as the Tithe Farm, comprising 64a. 3r. 35p., let at £80 per annum—£5,330.

Freehold estate, situate in the parish of Walton, Surrey, being part of the Tithe Farm, comprising farmhouse, buildings, and land 9a 3r. 9p., let at £30 per annum—£2,750.

Freehold residence, with stabling, orchard, and ground of 2a. 0r. 33p., known as Hersham House, Hersham, Surrey, let on lease at £40 per annum—£1,340.

By Messrs. Ventom, Clarke, and Bull.—Leasehold shop and premises, No. 2, Warwick place, Peckham Rye, term 34½ years unexpired, at £60 per annum—£355.

By Messrs. Debenham, Tewson, and Farmer.—Freehold four cottages, with outbuildings, orchard and meadow land comprising 1a. 2r. 30p. situate in the parish of Barkway, Hertfordshire—£380.

Freehold tenement, No. 5, Bull court, Tooley street, Southwark—£150.

By Mr. Murrell.—Freehold residence, with garden, shed, and outhouse, situate at Walthamstow, Essex—£510.

Freehold business premises, situate as above—£405.

Freehold four houses and shops, situate as above, producing £41 16s. per annum—£500.

Freehold four cottages, situate as above, producing £56 11s. per annum—£400.

Leasehold four houses, Nos. 28, 30, and 32, Halton road, and 9, Pleasant place, Islington, producing £88 per annum, term 51½ years from 1824, at £16 16s. per annum—£225.

Leasehold house, No. 86, White Lion street, Islington, let at £26 per annum, term 22 years from 1855, at £16 per annum—£52.

By Mr. Ward.—Leasehold residence, No. 8, Gresham-road, Angell Park, Brixton, annual value £65, term 97½ years unexpired, at £1 per annum—£840.

Leasehold residence, known as Bath villa, Park road, Battersea, let at £38 per annum, term 99 years from 1865, at £6 per annum—£270.

Leasehold residence, known as Park Villa, Park road, rental, term, and ground rent similar to above—£270.

Leasehold two houses and shops, Nos. 3A and 4, Park road, producing £70 per annum, term similar to above, at £6 each per annum—£490.

May 13.

AT THE MART.—By Messrs. Norton, Trist, Watney, and Co.—Freehold residence and stabling, situate at Westhill, Wandsworth, let at £65 per annum—£1,150.

Freehold two houses, Nos. 5 and 6, Love-lane, Wandsworth, producing £40 16s per annum—£500.

Freehold two houses, with stonemason's yard, situate in Love-lane, Wandsworth, let on lease at £60 per annum—£1,000.

Freehold two cottages, situate in Elizabeth place, Love-lane, Wandsworth, producing £22 2s. per annum—£300.

By Messrs. Dent and Son.—Freehold house and shop, No. 57, Leather-lane, Holborn, let on lease at £50 per annum—£1,020.

Freehold house and shop, No. 58, Leather-lane, let on lease at £60 per annum—£1,300.

Freehold cottage, shop, garden, and outbuildings, and an enclosure of meadow land, containing 1a. 1r. 19p., situate at Edlesborough, Buckingham—£290.

May 14.

By Messrs. Prickett and Son.—Freehold residence, No. 4, Hornsey-lane, Highgate, annual value £120—£1,900.

By Mr T. C. Haworth.—Freehold two houses, with shop and yard, situate in High-street, Eltham—£890.

Leasehold shop adjoining above, term 70 years from 1813, at £5 per annum—£200.

AT THE GUILDHALL COFFEE-HOUSE.—By Mr. Marsh.—Freehold residence, No. 3, Finsbury circus—£5,000.

Freehold house and shop, No. 76, Farringdon-street—£3,150.

Freehold three houses, Nos. 9 to 11, Wood's-wharf, Greenwich, producing £89 14s. per annum—£560.

Leasehold residence, known as Cupola-house, Church street, Chelsea, annual value £120, term 99 years from 1854, at £9 per annum—£1,360.

Leasehold improved rental of £139 12s. per annum, for 14 years, arising from No. 29, Cadogan-place, Sloane-street Belgravia—£1,250.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Francis Holman Greeo, Meyrick road, Battersea, builder June 15, at 12.—Frederick Hall, Edward street, Stepney carpenter, June 8, at 11.—George Hudson, Cambridge road Mile End, builder, June 8, at 11.—Pettit Millican, Stanton Suffolk, builder, June 4, at 12.—Richard Asheden, Thame street, Rotherhithe, bricklayer, June 4, at 1.—Rober Morris and James Meagher Field, Hanover street, Long Acre, sanitary engineers, June 4, at 1.—John Joseph Sibley York grove, Peckham, surveyor, June 4, at 1.

TO SURRENDER IN THE COUNTRY.

Thomas Brooksbank, Stanningley, near Pudsey, stone mason, June 9.—William Dungay, Denver, carpenter, May 25, at 10.—John Griffiths, Liverpool, slater, May 26, at 3.—George Robert Temple Heald, Sheffield, painter, May 27 at 1.—Henry William Hemmingway, Leeds, painter, May 25, at 11.—James Jutten, Brighton, carpenter, May 27, at 11.—William Hubbard Campling, Lowestoft, plumber and glazier, June 1.—John Grace, Shanbonro, near Winslow bricklayer, June 3, at 2.—William Hartland Haynes, Aston juxta-Birmingham, builder, June 3.—Evan Marpole Lanidloes, painter, May 30, at 12.—Benjamin Owen, Manchester, stone merchant, June 9, at 11.—John Pickup Nelson, Lancashire, plumber, June 10, at 11.—Thomas Wilson, Bishop Wearmouth, painter, June 5, at 12.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

June 12. J. Stevens, Hammersmith, buildor.—June 12, I Ryley, Greenwich, engineer.—June 19, E. Steddy, Howard road, Stoke Newington, builder.—June 3, J. Wetmall Battersea Park, builder.—May 29, J. Costin, High street Hoxton, plumber.—June 5, W. H. Izant, Grosvenor row Pimlico, electric engineer.—June 8, A. Kempton, Par street, Victoria Park road, carpenter and joiner.—June 1 A. J. Cohen, Gloucester street, St. John street road, timbe dealer.—June 12, J. Batty and S. Wake, Middlesborough builders.—June 4, W. Bradshaw, Waterloo, near Liverpoo joiner.—June 12, W. Johnson, Treorchi, stone mason.—June 22, J. Whittle, Peterborough, builder.—June 9, S. James, Truro, painter.—June 9, J. Stantan, Portscath Cornwall, builder.—June 12, J. H. Stothard, Morton, ne North Shields joiner.—June 16, J. M. Davis, Wolverhampton, engineer.—June 3, T. George, Swansea, painter.—June 5, J. H. Matthews, Newton Abbot, carpenter.—June 9, Fenner, St. Lawrence, Isle of Thanet, carpenter.

DIVIDENDS.

May 30, J. Jennings, Ventnor, painter and glazier.

PARTNERSHIPS DISSOLVED.

Tomlinson and Kitchin, Manchester, builders.—Wilson Brothers, Holbeck, builders.—Molloy and Mannion, Manchester, plasterers.

THE BUILDING NEWS.

LONDON, FRIDAY, MAY 29, 1868

NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.

MR. SCOTT'S new hospital, which has been so long in building, and which has become stranded in the mire of debt, is at this present a most unusual spectacle, and, instead of halt, maimed, and suffering poor, its inmates are the wealthy and joyous, in place of the softened hum of low words of consolation and kindness, and the still tread of silent nurses moving on their missions of charity, we have a very Vanity Fair with its sibilant babble of silks and voices. Fair dames, and fairer demoiselles, wander gaily in sick wards, and wounds are the rather given here than cured. What shortly was an open quadrangle is now a conservatory of plants, and music and Yorkshire worthies living and dead crowd all its corridors. The antitheses around us are all so strong that we feel bewildered; instead of bare walls and the painful neatness of a hospital ward, we find the choicest gems of ancient and modern art surrounding us; in place of lint, the rarest lace; and in lieu of the hospital kitchen, a *batterie de cuisine* with a *chef* in command, who has daily to feed his thousands. Nor is the building less a contrast to all preconceived ideas than its contents, and in lieu of our ordinary English solid block of suffering and disease, we have here a hospital arranged on the "Pavilion" system, which justly obtains preference on the continent—wards not piled on wards and packed closely together, but only two storeys high, and detached from their neighbours, giving free access of light and air to all its inmates, and ensuring thorough ventilation and consequent health. Ventilation is indeed rather overdone, and in too many instances becomes a draught; but this may easily be remedied. The building, which is just now the casket of such gems, is of costly and eccentric character, too much ornamented to be handsome, and cut up into too many little bits to be dignified. The money lost in littleness would have made grandeur if it had been better husbanded. The site on which it is situated is a very awkward one, and much ingenuity has been displayed in overcoming the difficulty thus occasioned; but the exterior has been allowed to blossom rather wildly, and consequently the fruit is weak. We have a centre pavilion fronted by an arcaded porch and flanked by low buildings on either side of one stage only, and uniting the centre with the main range of wards. These are semi-octagonal at their ends, internally having square projections jutting out from their canted faces, and which are very badly managed in the exterior, breaking up the ends into little fragments or rather splinters, and showing that they have cost much more money than thought. Everywhere we see that same painful littleness of detail Mr. Scott has vexed the world with so much of late; the same little balustraded parapets, even when no parapets are needed; the same long and lanky little shafts supporting the same attenuated mouldings we have so often regretted. We wish Mr. Scott would impart to his work some of his own cheery robustness, and show some Yorkshire daring in this work of his at Leeds. The great talent of Mr. Scott and the splendid opportunity he has of exhibiting it should induce some nobler efforts, and foster the desire to do something worthy of both. At present, however, it is the contents rather than the building which holds them to which public opinion is attracted, and entering by the main or southern entrance, passing along a wide corridor, and ascending a few steps, we find ourselves on the level of the main floor, overlooking its intended open quadrangle but now central hall, and which, we believe, is to be retained as a winter garden for convalescent patients, but which we fear may in this case destroy the perfect isolation of the wards which form the chief feature of the pavilion system here adopted.

The roofing of this courtyard is of iron and glass, and the hall thus formed is divided into nave and side aisles by iron columns united by arches, having openwork spandrels, and which at present, with its gay company, its crimson cloth, and its natural and artificial greenery, forms a very charming concert-hall, where Hallé and his orchestra discourse sweet dulcet music to a very inattentive audience, whose chattering forms not a pleasant variation on the sweet themes of Haydn or the dream-like strains of Beethoven and Mendelssohn. If the dear creatures must talk, why will they not wait for Verdi? They would then be sure that their neighbours on the opposite side of the hall were not unwittingly taken into their inmost confidence. Traversing the corridor, lined with the portraits of worthy Yorkshire men—which category, by the way, seems to embrace all good Englishmen—we reach the Gallery A, which contains, together with the ward over it (Gallery B), a collection of Italian, Spanish, and French paintings in oil by the old masters. This collection, it is greatly to be regretted, is very incomplete. Of early art we have hardly anything before the fifteenth century, and the names of Cimabue, Giotto, Taddeo, Gaddi, Memmi, and, in fact, all the early Tuscan painters, are absent. The earliest example here is a small specimen of Orcagna—the upper portion of some altar-piece of very excellent character, to which we shall revert when we can more particularly examine its great merits. Here, too, we find a couple of Fra Angelico's works, and some very fine Crivellis, with five interesting *cassoni*, said to be by Pinturicchio, but of very doubtful parentage, three of them interesting, however, as containing the history of that much celebrated but little known lady, the patient Griselda. Ghirlandajo, Fra Bartolommeo, Filippino (the son of the naughty Fra Filippo Lippi), Andrea Mantegna (the foster-parent of the art of engraving), Antonello da Messina (the stealer of Van Eyck's secret of painting in oil), and other teachers of the early history of the art of painting, are here represented, whilst Pietro Perugino, Da Vinci, Raphael, and Michael Angelo hand down its records from the fifteenth to the sixteenth centuries, whence a host of well-known names bring it forward, till the "old" masters merge themselves into the fathers of modern art. Of the Spanish school we have some fine works of Morales el Divino, Cano, and other early painters, followed by the riper works of Velasquez and Murillo, whilst the history of the art in France is illustrated by the works of Nicholas Poussin and his pupil Gaspar Dughet, who sought to emulate his master's fame by adding the name of Poussin to the one he originally bore. Lenain, Rosseau, Claude Vernet, are also here to bear up the standard of the lilies, and their rank is closed with the graceful labours of Watteau and Bouchet.

Crossing an upper terrace over the corridor surrounding the central hall, we arrive at the Gallery C, devoted to the exposition of the old masters of Germany, Flanders, and the Netherlands, forming the finest collection of this character ever before brought together. Van Eyck, Hans Memling, Nolgemuth, and his more celebrated pupil Albert Durer, form bright links in the beginning of a chain of glorious pictures, to which follow those of Lucas van Leyden and the industrious Holbein, and, bursting forth into riper fruit, we find the luscious brush of the ambassador artist, Sir Peter Paul Rubens, giving us his own peerless portrait and other wondrous works, varying from a slight sketch to the highly finished piece of flower painting. Vandyck, who we may almost claim as our own, and his rival for English patronage and pay, Cornelius Jansen, Van Huysum, Van Os, and a long train of other Vans, bid us halt each step, and the architecture of Peter Neess, with its wonderful perspective, takes us a long way from Leeds. Our intention is to first gain a general view of the whole of the contents of the building, so, resisting the desire to pause, we hurry on and reach Gallery D, devoted, as we find by the catalogue, to "British deceased painters in oil," but where, strangely, we find the names of Zuccarelli, Jansen, Mytens, Gerbier, and his pupil Sir Peter Lely, old Sir Godfrey Keller, Loutherbourg (the strange scene painter), the unfortunate Angelica Kauffman, and Zoffany, not one of whom was British by birth or education, and few of whom died here. Why Holbein, Rubens, and Vandyck are not claimed as "British deceased painters in oil" we do not know, as they equally with those others have the right to such an appellation. Of Hogarth we find little here that is good. Gainsborough, Romney, and Reynolds are represented, the latter by one of his three "Strawberry Girls;" and we find fine specimens of Morland, Stothard, Wilkie, and Etty; and in Gallery E the chain of British art in oil painting is brought down to our own day. Passing on to Gallery F we find a fair collection of modern works by foreign artists, many of which are familiar to us from our own French Gallery and their exposition in the Beaux Arts or the late International Exhibition at Paris. Observing the maxim *place aux dames*, we notice, first, the solidly painted head of a monk of the Brotherhood of Charitable Instructors, by Madame Henriette Brown, whose works now find so constant a home in England. Rosa Bonheur sends some new studies from the high bluffs of Fontainebleau, where now her home is, and her brother Auguste is represented by the best bit of colour we have seen from his easel. Of Ary Scheffer we have examples of his early and later manner. Duverger and Edouard Frere send their charming home idylls, and Messonier is represented by one of his most marvellous bits. Gerome has here his Phryne, and the collection of modern French art is very satisfactory. Belgium is represented by the works of the Baron Leys and his favourite pupil and almost namesake, Lies. Serrure, Verboekhoven, Bossuet, and, above all, Galliat sustain the reputation of the Belgian school and the "Art and Liberty" of the latter artist is the most striking work in the gallery. Van Schendel illumines the modern Dutch school by his perpetual candle, but the true light is shed by the works of Ten Kate and the beautiful classic studies of Alma Tadema. Tidemand shows well the peculiarities of Norwegian art, and from Germany none are more graceful than the works of Lehmann.

The Water Colour Gallery contains a short history of this very pleasant phase of art, commencing as it does with the early efforts of Paul Sandby, and, running through the works of Barret, Varley, David Cox, Copley, Fielding, Prout, and Turner, lands us amongst the works of our best living authors.

In Gallery H is a fine and highly interesting collection of drawings of early masters, and a fair exposition of the history of line engraving, but the art of engraving on wood is very poorly represented. Mrs. Hailstone's collection of old lace and a whole museum of Mediæval and Renaissance decorative art await us; but we can only walk through the galleries to see what to note for further examination, and, following the corridor of Yorkshire worthies, we come to two small rooms filled with *chef d'œuvres* of Indian and Oriental workmanship, leaving which we come to the head of the principal staircase, where we find a small but exceedingly choice collection of paintings from the Earl of Dudley's Gallery, embracing a marvellously fine Fra Angelico, some exquisite Peruginos, and three

fine Murillos, all of which are worthy of close study.

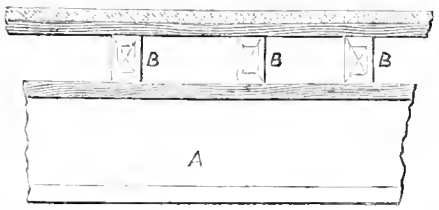
Having thus completed the circuit of the building we take our departure and defer till our next a more critical notice of the chiefest of the excellent works of art here brought together, urging, however, all who can spare a Whitsuntide holiday to visit this, the commercial metropolis of Yorkshire and enjoy the treat for themselves.

USE OF ASPHALTE IN CONSTRUCTION.—II.

At the close of our last article upon this subject we introduced the question of the construction of roadways and footpaths by means of asphalte, or, as it may be correctly termed, asphalte concrete, since it consists of the former material mixed with certain proportions of sand and gravel. Its application for this purpose is on a very extensive scale, as it embraces not merely the case of ordinary footpaths, but those including the platforms of stations, bridges, and viaducts. To begin with the first, of which there are abundant examples in and about London, unfortunately it must be confessed that for one really good asphalted footpath we meet with a dozen bad ones at least. For one that affords a perfectly smooth, even surface, there are ten that are full of hollows and inequalities, which in wet weather become so many pools of water. The road frequently offers a better place to walk upon than some asphalted footpaths. To what is this to be attributed? Is it the fault of the material itself, or of the manner in which the path is formed? The latter, unquestionably. There is not the slightest use in laying down asphalte concrete with any hope of making a good job of it, unless the immediate substratum or foundation be solid and unyielding. The reverse is nearly invariably the case with ordinary footpaths. They are generally raised about six or seven inches higher than the adjoining roadway, and the difference of level is made up with any stuff that may be at hand. This is rarely or ever rammed or well punned so as to consolidate it, but is roughly brought to a tolerable uniformity of surface, and the asphalte concrete laid on top of it. Sometimes a kerbstone is added, but just as often not, and then the job is considered complete, and the path is left, literally speaking, to sink or swim. From such a *modus operandi*, what can be expected? All newly made earth has a tendency, particularly after rain, to sink, which takes place more or less in newly raised footpaths, and the consequence is that the plastic asphalted layer follows the sudden and abrupt descents of its foundation, and the surface presents an appearance totally the reverse of what was anticipated. Were the same attention paid to the formation of the substratum of the footpath as is given to that of the road; were the foundation properly and truly laid, and a layer of coarse metalling packed closely over the whole area, there would be no inequalities in its surface, and although the asphalte concrete would wear away after a time, and need renewal, yet the wear would be uniform, and not give rise to holes and asperities under foot.

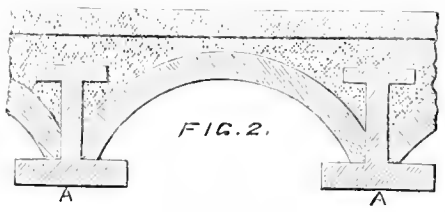
Those who have remarked the different appearance of asphalted platforms at the various railway stations will at once perceive that they afford a complete corroboration of our previous statement. Some of them are even perfectly uniform in surface, and, with the exception of a slight softness or elasticity to the tread, do not differ from a regular concreted surface. Others, on the contrary, are cracked in all directions, and it would be scarcely possible to discover a single square foot of uniform appearance or consistency. If we investigate a little how these two descriptions of platforms are made we shall at once find the cause of their difference. The former are universally laid upon either solid or carefully made ground properly prepared by ramming and consolidation for the reception of the concrete. The latter are laid upon planking, which fails to afford that rigid unyielding foundation which is indispensable to the formation of a good asphalted surface. In fig. 1 is represented the

FIG. 1.

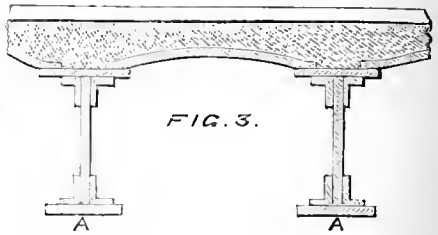


foundation of a common construction of a platform of a small railway station. A is a dwarf wall carrying the transverse joists B B, upon which is laid the sheeting or planking, and over that the asphalte, as shown. Both the joists and planking are sure to yield or "give" a little, which is quite sufficient to cause irregularities in the top layer, more particularly when it is borne in mind that heavy weights are constantly run over it at speeds high enough to cause considerable vibration and deflection in the sheeting. It may be accepted as a rule that it will not do to lay down asphalted concrete upon a timber foundation, unless it be of a very massive or solid description, which would only occur in places where it would not be desirable to use asphalte at all in the sense here understood. Occasionally in hot weather it happens that an asphalted surface becomes sticky and adhesive to the foot, but this is simply the result of either want of care or want of skill and experience in the preparation of the concrete. It may also result from an improper selection of the material, for in our last article we pointed out, in referring to the origin of bitumen, that temperature has a good deal to do with its formation. If therefore a bitumen be chosen which melts too readily, and which is not therefore the best adapted for the purpose, there is no difficulty in accounting for the excessive plasticity that is imparted to the concrete.

Asphalte is employed in forming the roadway of bridges in two conditions. It is mixed in the ordinary manner, as just described, and it is also composed of bitumen mixed with cork instead of gravel. The great advantage of the cork composition is its lightness. It is, of course, not suited for the same situation as the concrete, but forms an excellent method of filling in the haunches of small arches turned between the main girders or cross beams of a bridge. A very common, but at the same time somewhat obsolete type of constructing the roadway of bridges is represented in fig. 2. The main girders are



of cast iron A A, and are of the usual flanged shape, demonstrated by the late Mr. Hodgkinson to be that best adapted to give the maximum strength with the minimum expenditure of material. From the inside of the lower flanges spring small brick arches, the haunches and level up to the surface of the road being filled in with concrete, ballast, or any good dry suitable stuff. One great objection to this arrangement is the weight of the whole superstructure, which necessitates heavier girders than would be the case if a different arrangement were adopted and a lighter description of concrete filling employed. Contrast fig. 2 with fig. 3, in which the heavy cast-iron girders are replaced by two light wrought-iron ones A A; the brick arches are done away with, and thin wrought-iron plates arched to the proper camber substituted in their stead. The



filling-in for the substratum immediately below the road metalling is composed of cork and bitumen, which effects an immense saving in dead weight, an item of considerable value in the designing of bridges, and proportioning the sectional area of the girders and other parts of the structure. Moreover an advantage attends the use of this light concrete in many respects similar to the one we drew attention to when treating of the employment of asphalte instead of slates in the foundations of houses. Frequently it occurs that the layer of cork and bitumen does not exceed a couple of inches. Were ordinary lime and gravel concrete used in a layer so thin and in a similar position it would be almost sure to crack, and would subsequently become reduced to a state of complete pulverisation. In this condition it would be little better than loose dust, would be deranged by the traffic going over the bridge, would let in the wet under the roadway, and in a very short time become perfectly useless for the purpose for which it was originally intended. Asphalte concrete prepared with bitumen and cork was adopted somewhat in the manner we have described by Mr. Page in the construction of his handsome bridge over the Thames at Chelsea, a structure which, together with his *chef d'œuvre* at Westminster, constitutes one of the few architectural beauties of our metropolitan river. In addition to the many uses of this valuable material, it is also gradually gaining ground as a partial substitute for paint. The girders and plates of the bridge in question were coated with a layer of asphalte previously to being covered up with the superstructure. There is one general principle to be carefully attended to in applying asphalte paint, or any protecting layer to ironwork of any kind, whether cast or wrought. It is to be sure that the surface of the iron is perfectly clean, and free from rust and spots. There is not the slightest use in painting or coating rusty iron with asphalte. However well it may appear to adhere when first laid on, after a short time it will inevitably excoriate and rapidly scale off, leaving fresh surfaces to be acted upon and deteriorated by the injurious influences of air and moisture. That asphalte is a stronger protective agent against damp than paint, is highly probable, not only on account of its possessing a denser consistency, but also because *per se* it contains elements that are themselves anti-corrosive, and naturally calculated to counteract the effects of climate and humidity.

We must reserve for a concluding article the subject of the application of asphalte to roofing, which has been very successfully accomplished by the use of the Seyssel asphalte.

THE COMMON LODGING-HOUSES OF LONDON COMPARED WITH THE PRISON AND WORKHOUSE.

At the base of modern society, particularly in London, is a great mass of fluctuating atoms sometimes occupying the common lodging-house, sometimes the workhouse, more frequently the gaol or the house of correction. With the moral state of these beings we do not propose to deal; but their

physical condition, involving as it does some important social problems, is not unworthy of attention. Between the great criminal mass of the country and the really honest poor, exists a certain number who live how they can—be it honestly or dishonestly, either is the same to them. Many of these are verging downward, and their haunts and associations are too frequently the means of effecting their final declension from well-doing.

By common lodging-houses the law understands any dwelling containing rooms inhabited by four or more individuals not being members of the same family, and their inspection and regulation constitute an important part of the functions of the police. Engaged in this work, the metropolitan police have a body of five-and-twenty men, under the charge of Chief Inspector Roberts, to whom is entrusted the duty of looking after all common lodging-houses within their district, no very light task, extending as it does so many miles beyond London proper. We do not now propose to discuss the whole subject or to describe the condition of each lodging-house, or even group of these, for they are generally found associated; but shall limit ourselves to a notice of perhaps the most typical group of all, that lying between Commercial-street and Brick-lane, in the east of London, and extending from Whitechapel through Spitalfields towards Shoreditch. Without doubt, the head-quarters of "cadgerdom" is to be found in Flower and Dean-street, which lies between the two above-named thoroughfares, and in it or its neighbourhood every variety of the common lodging-house, from the best to the worst, may be met with. Besides the professional thieves and beggars who there abound, there is in this part of London a large floating population of unskilled labourers, chiefly attracted by the labour to be obtained about the docks. In some of the lodging-houses labouring men are alone to be found. Now and then a rogue may creep in, but he is got rid of as soon as discovered. This is the best class of lodging-house, and in some of them men have stayed for years, until they have almost become fixtures in the establishment. This class are entirely occupied by unmarried men, who pay fourpence a night or two shillings (in one instance two and fourpence) a week. One of these establishments is calculated to accommodate nearly three hundred guests, and most receive more than a hundred. The kitchens are ample and well arranged. In the large one to which we refer the lavatory is convenient, cooking apparatus is supplied, and each man may have a small locker set aside for his use. There are besides, in this as in others, rooms cut up into boxes, as in a coffee-house, where the men may meet to chat and smoke. In one or two there is also a reading-room, which does not unfortunately seem to be in very great demand. To accommodate such a mass of humanity under one roof sleeping space is utilised to the uttermost; the staircases, passages, and doorways (for there are seldom doors) are as narrow as possible. Not, however, that any number of beds may be accumulated in one room, each is surveyed by a Government official, and in each room is suspended a card marked with the number the room is licensed to receive. Still the cubic space allotted to each individual is small, not exceeding 300 cubic feet; ventilation is effected by doors, windows, and orifices in the walls. In the swell (two and fourpenny) establishment, and in those in which married people are received, the large rooms are cut up into small compartments containing two single beds or one double one. These wooden compartments do not, however, reach either to the roof or to the floor, for the sake of ventilation, and they are not of uniform size, the whole room being surveyed for the number of inmates, but the compartments being erected at haphazard. Some containing a window are not so badly off, but others, for example, in dark corners are extremely close and stuffy. The price of the double bed in most houses is sixpence a night. Greatly inferior is the accommodation at threepence a night; still in some, particularly in one house, mostly frequented by boys, it is not to be despised. In one large room in this house there are beds for forty persons. These beds are partly wooden, partly of iron; they are supplied with two sheets, one being changed every week. The walls are kept whitewashed, and the bedsteads are regularly taken to pieces and saturated with naphtha to destroy vermin. All lodging-house keepers are not equally particular, some making no pretence of separating sheep from goats, and making no inquiry as to the callings of their guests, provided the money is forthcoming. In those regularly frequented by thieves and other blackguards the accommodation is deficient; still the vigilance of the police secures a certain degree of attention to decency and cleanliness. The communications between the bed-rooms, and from them with the ground, are exceedingly devious; to trace them would be no very easy matter to one unaccustomed to the premises. In these also the cooking arrangements are greatly inferior to those in the place we have described, but then the thief has the solace of congenial society and accurate intelligence, which is to him no light matter. Swell thieves do not frequent such localities; they generally live a little way in the country with great outward respectability and decorum. The grand evil, apart from all moral considerations, is the defective ventilation. In summer the dormitories are hot and stifling; in winter men cannot be prevented from filling up every crack and cranny, when the air speedily becomes foul and unwholesome. Still it must be borne in mind that these sleeping rooms are only occupied during the night. Every morning they are cleared out by ten o'clock, and the places, as far as possible, cleaned and ventilated. Most of the houses are held by deputy, the landlord to whom they are licensed frequently occupying three or four, and generally living in the best and quietest; the deputy in the others is entrusted with the management of the whole concern. It must not be forgotten that the places we have been describing are not philanthropic institutions, but real *bonâ fide* investments, whereby the proprietor expects to live, reaping a goodly harvest in winter, when all hasten to town and sleeping in the park won't do, faring less sumptuously in summer, when all who can go are off to the country to hop picking, market-gardening, brick-making, and such like employments.

But let us trace the history a little further. The thief gets into trouble and goes to prison; the times are bad, the poor labouring man is out of work and goes to the union. Upon the whole, the thief has the better of it as far as food is concerned, that is to say, should his sentence exceed four months, but his work in a well-organised prison is very hard. As to his lodging he is better off; instead of having only 300 cubic feet he has in most prisons nearly 900, that being the cubic contents of each cell. But there are the hard work, the hard fare, and the restricted liberty as counterbalancing agencies. None of them like prison. When the times are bad the poor man has his choice of the workhouse or the prison; if honest, he chooses the former, which he can leave when he pleases. Should it be so, his condition is also altered for the better in certain respects. Now of late there has gone abroad a cry for increased cubic space in workhouses, a cry taken up, we fear, too heedlessly by many. We have seen that the ordinary amount allowed in these lodging houses is 300 cubic feet; this is the breathing space to which each man has been accustomed, but a number of would-be philanthropists insist on increased workhouse accommodation to the extent of 1,000 cubic feet for each individual. This we may safely hold is not necessary for people in health; for those who are inmates of an infirmary we should not think of anything under 1,000, or even 1,400 or 1,500 cubic feet, but then these wards are occupied night and day. Where day rooms and dormitories exist 500 cubic feet in the sleeping rooms, provided the ventilation be good, will suffice for all practical purposes with healthy men. The inmates have seldom been accustomed to so much. It must be remembered that the palatial edifices contemplated by some have to be paid out of the poor rates, and that these are exacted from all, even from a class but a step removed from the pauper. The consequence of an increase in the rates would be to decidedly increase the latter class, which is sincerely to be deprecated. One effect of the poor laws has already become sufficiently unpleasantly prominent; the providence of the working classes, as well as their frugality, has thereby been greatly impaired. If the scheme for erecting palatial workhouses be carried into effect, these unsatisfactory tendencies cannot fail to become more marked. The actual condition of the class immediately above the pauper must be understood and borne in mind when dealing with the class they may any day and on the slightest inducement be led to augment. Thus we think it good to compare the common lodging-house, the prison, and the workhouse as they are seen in London.

ART PRACTICE *VERSUS* KNOWLEDGE.

THERE are so many points of difference between the old and modern art, or rather between the old and past system of art production and the mode of production now in such active operation, that it is extremely difficult—perhaps, on the whole, impossible—to find two words which shall express generally and intelligibly this difference. It is, however, so important, for the sake of clearness, that this should be at least attempted that I venture to adopt the two most expressive and generally descriptive and explanatory I can hit on, namely—Practice and Knowledge. *Practice* was the secret that enabled the old artists and workmen to accomplish the wonders they did, every artist being his own workman. *Knowledge* it is now thought is the one thing needed. Why, it is asked—for the world has just got to this question,—does not the modern art work of to-day produce the same sort of impression on the minds of men as the work left us from the past, and from the hands of the old artists and workmen? The answer always is, from all quarters, that both artist and workmen—especially the workmen—want *educating* or cramming with more and more knowledge. This is so vital an error, as it seems to me, that I think a few passing thoughts on it may help to serve a good purpose; for while such an idea as this on the very threshold lasts, no change for the better can well be hoped for.

That such an error, if it be one, is vital, will be at once evident to everyone when it is considered that all the encouragement, and, what is more, material help now held out to executive artists and workmen, consists in putting in their way, and indeed insisting on their taking advantage of, every possible means of adding to their stores of art knowledge, and of everything else which it is thought can possibly bear on it. If the student is versed in one style of art, he is recommended to apply himself steadily to another, and to make all haste to acquire a knowledge, more or less complete, of it, and then to go on to another. Lectures, books, and treatises without number are always at hand to urge and help him on, and in the end prizes to reward him, should he luckily be able to pass some dull examination by mere effort of memory on them. Not only this—and it is worth noting—there is now in course of compilation a huge catalogue of art

books, which is to cost many thousand pounds, for the purpose of reference, and to show how many volumes and treatises there are on the one subject of art. It is quite certain that no student life, however long, would be long enough to read through the prefaces or perhaps even the title pages of these multitude of volumes! What good are they, and what artistic use could be made of them, even if all were read through? Everybody who knows anything of architectural books knows well that nine out of ten of them are worthless, for the illustrative plates are manufactured in snug rooms miles away from the buildings they profess to represent. Of the theoretical books simply nothing need be said; yet are thousands of pounds being now spent in making a mere list of them.

All this is lamentable enough, but it is not the worst that needs to be said on the present system of art action through the medium of books and educational apparatus, for be it remembered that of the two most noteworthy books about art given to this generation, "Pugin's Principles" and "Ruskin's Modern Painters," next to nothing *practically* has resulted; indeed, it would almost seem as if no one living had ever read them. Pugin's main argument was "build in Gothic and let the natural material show itself fairly." But where are the *Gothic* buildings forming the new parts of towns, and where is the natural colour of the materials in new buildings allowed to show itself? We oil-paint everything. Ruskin endeavoured to show, in many elaborate volumes, that it was well worth the painter student's while to go into the lanes and byeways of unfashionable places away from towns, and bring back remembrances of what can be seen and painted for nothing: but if we go into the Royal Academy Exhibition it will very soon be evident that such advice, whether good or bad, has not been followed. Perhaps Mr. Ruskin's books are already forgotten, and rest only to be catalogued. May we not fairly ask here, of what use is it educating people if books giving such advice and guidance be left to the dust and silence of the upper shelf, no man remembering them? These are facts, and deplorable enough.

I have no wish to travel beyond the immediate subject of this communication, viz., education as it concerns the practical artworkman, but a word may perhaps be permitted me on the very strange course education has taken and is taking. When Lord Brougham sent the schoolmaster abroad did he ever dream of the main effect it would have on the literary pursuits of the working and middle classes? The reading of these worthy and educated people now in the main consists of "stories" by the dozen a week, all on the move at the same time. They are sometimes said to be bad and very wicked; they are neither. Nothingness, dulness, and repetition are the main elements in them all, and the real wonder and mystery is, not at the fact of anyone imbibing so much of wickedness, but how it is that after having read *one* of these tales anyone, however determined, can be induced to tackle a second, much less ten or a dozen. But this is the improved working man's reading. The clergy may, I suppose, take rank as the most highly educated class in this great country, and compose the top of the educational system as the better sort of workmen form the bottom of it, but any person of ordinary intelligence listening to a sermon in St. Paul's or Westminster (the sermons are the results of all the education be it remembered) would never for a moment suppose that modern advanced science had any existence. The "ologies" to these learned men have no reality; bodily they live in the present nineteenth century, but mentally and spiritually they are in the tenth. Such is education, practical education. The clergy are *technically* educated, but they cannot *read*. But this in parentheses; what I want to show now is that our modern idea, that by educating a man, *i.e.*, by adding continually to his stores of information—for it intends nothing beyond this—you are adding to his powers, his artistic powers, is a delusion. It is, I consider, a fatal mistake to suppose that an ordinary workman or artist found to be more or less incapable is to be best helped and rendered capable by filling his head with the history of even his own art, or with dates and biographies, or fragments of science, or putting into his head receipt books and rules, or, in short, by beginning with his *head* at all. It will be found on attentive examination that a stupid incapable workman, unskilful in the art he lives by, if he be naturally fit for such art, is either out of practice or has not had enough. His hand is at fault; he needs improvement, but his hand *must lead his mind* and ask for guidance. There is no other way in which artistic skill can ever be acquired, and all attempts, such as those now in fashion, by additional education or *mental* cramming, must end in failure. This is a subject of very great interest and has never, I believe, been made the subject of professional and artistic inquiry, and it is to be feared will possess but small interest now, as the whole art power in artists and workmen in these days is lost in mere manufacture, so that no public interest is felt in *individual* artistic skill. The powers of the human mind are wonderful enough, but those of the hand as guided by the mind are not a whit the less so. Indeed, what can be more strange than the different effects produced by a number of hands in the mere copying of some object in common lead pencil in outline, so different is the touch, the method of handling, the coarseness or smoothness of the pencil lines, and the feeling, as it is called, displayed, that the object becomes different and new under each individual hand. Well has it been observed by some cunning philosopher that without the hand the mind of man would have availed him nothing. It is thus that practice in the artist and workman becomes the one thing needful—the hand first and then the head, directly reversing the present system of art education.

From this principle again it will become evident that the great object to be aimed at in the future of art action will be to obtain from each artist and workman, however humble their powers may be, examples and evidences of each man's individual power and skill, whether he be painter, sculptor, architect, or subordinate workman, and it will then be seen by those who have taken on themselves the office of guides and instructors that what is called bad work, even when genuine, is not the result of lack of knowledge in the executive artist, but of deficiency of executive power and manual skill. This may sound a little strange to very many, but no one can, I think, witness the efforts of unlettered workmen, and look closely into the character of the rude work of savage and barbarous tribes, as that of the New Zealanders [on a mental level with our workmen as artists], without speedily coming to the conclusion that artistic skill in cutting a leaf out of stone is and must be the result of joint natural capacity for the work and hand dexterity and practice, daily practice. No learned amount of "botany" can help a carver to cut a leaf, but without practice what can he do? It will not therefore be out of place or useless, considering the importance of the subject to the artist and workman, particularly the last, to instance in detail, as shortly as may be, one or two familiar instances wherein it will be seen how far this principle of practice in art must always precede knowledge, how useless knowledge is by itself, and that accumulated stores of art learning must be at best but amusing and entertaining curiosities, but of no practical application or benefit. Whether the public can be interested in this practice of individual artistic action has to be seen; if they are, then the whole of the system of art employers and manufacturers in the production of art must in time cease to exist.

C. B. A.

GOSSIP FROM GLASGOW.

(From our Correspondent.)

It is stated in the local newspapers that there is a likelihood of the Liberal students nominating Mr. Ruskin for the honorary office of Lord Rector of the University. In the event of the great art-critic being elected, it would be a graceful act on the part of the Architectural Society and the Institute of Fine Arts to recognise him in some way worthy of his reputation. Some of our citizens are in hopes that Her Majesty may be induced to return from Balmoral *via* Glasgow, for the purpose of laying the foundation stone of the new buildings being erected for the University, and that this, failing other causes, may lead a few non-subscribers to supplement the handsome sum that has just been voted by Parliament.

I observe a good deal of correspondence in your columns about the "earth-closet" system. A patent for an earth-closet was taken several years ago by Mr. Carrick, of the Royal Hotel, brother of the city architect and master of works, which closet has been extensively made in cast iron by George Smith and Company, of the Sun Foundry.

In rapidly growing cities bits of civic scenery are doomed to be suddenly shut out by the new necessities. There was no finer picture of the Cathedral—grouped with, on the one side, the dome-covered Infirmary, and on the other with the Fir Park Necropolis crowned with Knox's Monument, and with its pretty foreground of tile-covered cottages—than that facing the west, and seen from Mason-street, but it has been wholly shut out from sight by the new building erected for the Barony Free Kirk. And, in like manner, the new warehouses recently built in Sanchiehall-street interrupt a prospect to the west, in which were grouped the ridge of Garnet hill, the towers of Park Church and the Free Kirk College, and a few magnificent old trees, over which streamed, as nowhere else in Glasgow, such glorious sunsets as Turner wantoned with and Sam Baugh paints. The scenes in both cases are remarkable buildings, the Barony Free Kirk being a noble Gothic pile by Mr. Honeyman, and the warehouses, those Greek buildings by Mr. Thompson which I recently described; but I fear that in neither will be found adequate compensation by the lover of the picturesque.

A church, to be called "The Robertson Memorial Church," is about to be built from designs by Mr. Barclay at the corner of Taylor-street and Rotten-row, an ancient and decayed part of the city in the neighbourhood of the Cathedral, but wherein at one time dwelt civil and ecclesiastical nobles.

The Cathedral, that has for some years been a picture-gallery, is now also a concert-room, the Choral Union giving occasionally within it "promenade concerts."

On the afternoon of May 19 the foundation stone was laid of the Free High Kirk, Patrick. The design is by Mr. Honeyman, of Glasgow, an architect who worthily enjoys a most extensive practice in ecclesiastical architecture. The style is Early Geometric. The accommodation will be for a congregation of about 720, and the estimate is £4,600.

He who would make a pun would pick a pocket. So said Samuel Johnson, and such punsters as Thomas Hood, Douglas Jerrold, and Theodore Hook have, I am happy to say, picked mine of a good many current coins of the realm. But he made something more than a pun who said that the daguerreotype was *a-foe-to-graphic-art*. Not only has it imitated humanity as abominably as have some of nature's journeymen, but to the art of architecture also it has been a positive nuisance. In all our best streets it sets up its inartistic temples on the housetops, disturbing whatever sky-line the architect may have contemplated for either his especial design or the general effect. This might perhaps be tolerated on the commonplace house—the stereotyped "box"—but when it usurps a place upon buildings with really some architectural pretensions, it becomes an insufferable eyesore. Something of this kind is just now being done on the roof of a fine old Italian mansion-house in Argyle-street. Of course as property has its privileges as well as its duties, I suppose we can only solace ourselves with the philosophy of the maiden in Rasselas, that what cannot be repaired is not to be regretted.

Byron awoke one morning and found himself famous, and the suburb of Paisley has found itself about as suddenly famous for great Coats as

it has been erstwhile for starch, shawls, corn-flour, and muslin. A Mr. Thomas Coats has gifted to the town a public park, engirdled it with a railing, and erected within it a fountain. The fountain is of iron, and with the railing has cost between £8,000 and £9,000. The total value of the gift is estimated at £20,000. On Tuesday Mr. Coats handed over the title-deeds to the town council as the representatives of the inhabitants, and the park was declared open to the public.

The new premises for the Deaf and Dumb Institution were formally opened on Friday by Lord-Provost Lumsden, the foundation stone having been laid nineteen months ago by Lord-Provost Blackie. This building not only occupies one of the most beautiful of situations in the new neighbourhood of Glasgow, but its position towards the park of the South-side is somewhat analogous to that of the University towards the park of the West-end; and the architects, Messrs. Salmon, Son, and Ritchie, seem to have well considered these circumstances in studying their design. The building is good to be looked at and looked from—two most important properties for those whose information and enjoyment are received chiefly by the sight. The style of architecture is foreign Gothic, and the principal materials that give it form and colour are white and red sandstone and blue and grey slate. The principal elevation is towards the west, and is 240ft. in length. It is in three compartments, the centre of which is three storeys high, and each of the wings two storeys. On the ground floor of the central compartment are the vestibule, the directors' and reception rooms, also a parlour and dining rooms for the parlour boarders and the staff of the institution. Off the corridor, towards the left, are the apartments for the headmaster and the boys' recreation hall and lavatory, also a suite of bedrooms for the male parlour boarders. Towards the right are the matron's apartments, and similar accommodation for the females. Behind the principal staircase is the dining-hall, measuring 47ft. by 28ft.; and adjoining are the kitchen, laundry, washing-house, drying-closet, servants' sleeping-rooms, &c. The first room come to after ascending the staircase is that in which the girls are taught sewing and knitting, and is 36ft. by 18ft. Right and left of this room are placed stores, wardrobes, bath-rooms, lavatories, assistants' rooms, and sleeping wards. To the east, with separate stairs to it from both boys' and girls' departments, is the school-room, 70ft. by 35ft., with an ornamental ceiling of timber. Entering from the school-room are the stationery-room, library, and museum. In the third storey are the nurses' rooms, spare bedrooms, and the convalescent hall. The roof of the central division is a platform 23ft. by 19ft., and from this is commanded as a centre the magnificent prospect that I have faintly indicated. The building is well fitted for its purpose, and is in all respects a remarkable contrast to that which has been occupied by the institution for the last forty years. On the right of the principal gateway is a lodge for the janitor. Spacious recreation and ornamental grounds are being laid out by Mr. M'Lellan, the city's superintendent of public parks, who gives his services gratuitously to the institution.

BUILDWAS ABBEY.

THE following description of this ruin is from a paper read before the Liverpool Architectural and Archæological Society, entitled "Abbey Ruins of the Severn Valley," by Henry H. Vale, F.R.I.B.A.:—At Buildwas the proximity of one of the first iron bridges to one of the earliest religious houses in England affords a striking contrast of ideas; and at Conway we find the old castle of Edward I. and Stephenson's tube in a similar relationship. This first iron bridge of Telford's, at Buildwas, is by no means an elegant structure: it is quite evident that the true theory of the application of engineering forms to this material had not become developed in this early stage of iron bridge building. The supporting framework seems to have been modelled upon the idea of timber centreing, and the minute parts, such as panels and parapets, have a thin wooden appearance; but we can readily understand how difficult it must have been to obtain anything superior before the engineers and iron-workers had felt the importance of the material, and foreseen its almost universal application to the mechanical requirements of the age. Skilled hands had to be trained, careful and expensive patterns made, before iron took its proper place in the manufactories and worksh ps of England. Buildwas Abbey stands upon a secluded site. The masonry is grey and time-worn, with the matted ivy clustering upon it, and the rich lichens dappling it with varied tints, like a painter's palette; and here the river also, with its grey pebbly shores and green banks beyond, presents a similar effect of colour to the eye; in fact, the ruins of the abbey seem to have become a portion of the fair landscape, to have grown into it, and have become absorbed by it. It is backed by a bluff of yellow corn land, two well-wooded hills, some ancient cedar trees in the foreground, and comfortable-looking farmsteads beyond.

After visiting larger and finer ruins, Buildwas Abbey at first disappoints us; it possesses, moreover, none of those beautifully delicate details and exquisite ornaments which we find at Tintern and Haughmond Abbeys, and hope to find, in even greater profusion, at Wenlock. Here at Buildwas the style adopted is severe in the extreme: it belongs to the period when our ecclesiastical builders, after having long run riot in the luxuries of florid Norman, with its chevrons and billets and cables and beakheads, its deeply recessed doorways, with their sculptured tympanæ and ornate pediments and enriched capitals, sought repose and quiet in the flat surfaces and depressed arches and massive piers with serrated capitals, such as we find in this sequestered little abbey of Buildwas. The religious order inhabiting the house asked neither for the adornments of the carver's chisel nor the graces of the painter's easel; a stern asceticism broods over the place; and those who live mainly in the regions of fancy and imagination will find little of either interest or beauty to detain them here. There are, however, many who can enjoy the aspect that Buildwas Abbey presents: ever and anon men will be found who, having turned away their eyes from the more resplendent styles, will be led to adopt similar principles in treating the architecture of our own day. We observe this around us on every hand: a particular style or period being adopted by some religious order, brotherhood, denomination, or sect, those whose tenets run in a contrary groove will immediately take up and work to an issue some phase of architecture as different as they can, by the exercise of all their ingenuity, detect, invent, or discover. It was doubtless no different sentiment which induced the Cistercian brotherhood to erect at Buildwas this severe little abbey.

No smiling graces here to keep alive the tender associations of sunny childhood in the breasts of men! No touches of poetry here to instil a feminine gentleness into the rugged souls of the solitary and world-forsaken! No living stone-books filled with rebus and charade and fairy fable here to arouse the curiosity and stimulate the fancy of the lonely dwellers in this solemn little hospice! No touches as of a Dickens, a Jerrold, or a Thackeray, done into stone, to make the reader pause and consider that there existed the greater brotherhood of the universe beyond these narrow walls, for whose woes, and joys, and griefs, a tear, a sigh, a smile, or a "Well done, brother," never entered save as an intruder here.

The remains of the abbey of Buildwas, dedicated to Saint Mary, consist of a nave of seven bays, 105ft. long by 50ft. broad; transepts 84ft. long; four eastern chapels, and a choir with a square east wall; the arches of the nave are of unequal span, very slightly pointed, as also those of the tower; the two west windows, the three east choir windows, and those of the nave clerestory are round-headed; there is neither western doorway nor triforium.

The choir is brought one bay into the nave, on the south wall of which are three stone sedilia and a water drain. The cloister court measures 91ft. by 87ft. Beneath the north transept is a crypt; and on the north-west angle the fragments of a turret stair, which led to the dormitory over the vaulted chapter house, the latter measuring 41ft. by 31ft.; adjoining are two groined passages, one leading to the cemetery and the other to the abbot's house.

In the descriptions of this abbey given by the old topographers, mention is made of a subterranean passage near the abbey, but almost all the recent writers upon the subject have discredited this tradition, and even the local antiquaries seem to be totally ignorant of the existence of such an underground passage at this place; they may now, however, satisfy themselves about the matter by a personal examination upon the spot, as we ourselves did. It would appear that recently a heavily laden cart or waggon, on passing over the court adjoining the abbot's house, by its weight, caused the arch which covered this passage to give way; on removing the débris it was discovered that a considerable length of this so-called fabulous subway could be actually traced. On expressing a desire to see it to one of the workmen engaged upon some repairs at the abbot's house, he procured a ladder and candle, and on following him through a trap-door, after going about 15ft. down a vertical brick shaft, we found ourselves in this veritable tunnel. It appeared to be about 10ft. in height, and 4ft. in width, formed of excellent squared masonry, with a semi-circular arched covering of well keyed ashlar. We followed it for about fifty yards, our further progress being impeded by soil and the débris of fallen stonework. We noticed one rather puzzling feature, viz., the existence of a bold jutting stone corbel, at about 6ft. from the floor level—the only practical purpose which it could have here served, as it appeared to us, being that of a bracket, for holding a lamp to light the passage.

Buildwas Abbey was founded by Roger de Clinton, bishop of Chester, in 1135. It appears to have been dedicated to St. Mary and St. Chad, for monks who were afterwards united to the Cistercian order. King Stephen confirmed the foundation.

Camden mentions "Bildewas" as the burial place of the Burnell family; and Leland says that "Matilda de Bohun, wife of Sir Robert de Burnell, was founder of Bildevais Abbey, though some for the gift of the site of the house take the Bishop of Chester for founder." At the dissolution, the site and all lands belonging to this house were granted to Edward Powis. "Here were twelve monks," says Grose, "endowed with £129 per annum." Those monks had scenery around them of surpassing beauty, with the lordly Wrekin in full view.

The abbot's house, as before stated, was at the time of our visit under repairs, and we were interested in examining the remains of some spirited water-frescoes, or rather stencillings on the walls, of Elizabethan type, which had been covered over by several layers of papering during the last fifty years. The pattern had been laid on the wall in a kind of neutral tint, showing the white plaster through it for relief, and represented animals and grotesque heads; it had been, unfortunately, too much injured for restoration. Let us hope that the architect of the present repairs will cause these remains to be carefully copied, to serve as illustrations to some future history of the architecture of the Severn valley.

On leaving Buildwas we felt that we had been amply repaid for a somewhat tedious drive by this opportunity of verifying the tradition of the subterranean passage, and pointing out to the workmen these curious frescoes on the plaster, which, as they assured us, we had been the first to discover.

SCHOOL OF ART.

THE annual meeting of the Birkenhead Government School of Art was held on Monday evening. From the report, which was read by Mr. Hinde, the secretary and treasurer, and adopted by the meeting, it appeared that the institution, although worked under many disadvantages, had been eminently successful, and had fully contributed its quota to art education. Of the students who had attended the schools during the five years ending December, 1867, 259 had been workers in iron, 109 workers in wood, 77 bricklayers, masons, and plasterers, 44 plumbers and house painters, 52 architects' and surveyors' apprentices, schoolmasters, and governesses, 41 of sundry trades, and 53 school boys and girls, making a total of 659. Thirty different branches of trade had thus been benefited. The students had received 448 prizes of different grades, including five Queen's prizes and 105 medals from the Science and Art Department. The treasurer's statement showed that the working expenses were far in excess of the subscriptions. It had been suggested that the fees for attendance at the evening schools should be raised, but this step would, in the opinion of the committee, close the doors of the school against many who were making sacrifices to pay the present charges of 6s. and 10s. 6d. a quarter, rates sufficiently high when it was stated that of the 104 students attending the evening classes during 1867, 101 were apprentices in receipt of merely nominal wages, and in most instances the sons of working men.

PARISH CHURCH COMPETITION, SLOUGH.

In the early part of March a limited number of architects were invited to send in designs for a new parish church at Slough. Their names are as follows:—Mr. A. Bedborough, Southampton; Mr. R. Brandon, London; Mr. Bignoll, London; Mr. Conybeare, Westminster; Mr. Edgington, Windsor; Mr. Francis, London; Mr. Fowler, Louth; Mr. James, London; Mr. Seddon, Westminster. The drawings have been on exhibition for about a week in the town, and we believe that the committee will come to some conclusion this week.

The first premium is £50, and the second £25. The instructions require that the cost shall not exceed £10,000; the stone to be Heath stone for exterior, and ashlar or compost for the interior. A right-angled chancel is insisted on, and although the style is not absolutely limited, the transition between Early English and Decorated is recommended. Seating is required for about 1,200, including school children. In one particular the designs display remarkable uniformity, the flanks being for the most part plain even to bareness, while the east and west ends are of a very decorated character. The design bearing the motto "In cruce spes" exhibits this in a marked degree, the nave and transept being very Early Pointed, with the faintest trace of cusping in the window-heads, while the west front displays a rose window of very elaborate pattern, though not of very good design. The tower and chancel are also of later date than the body of the church. For some occult reason the roof of the chancel is of a much sharper pitch than the main roof, and the effect is decidedly bad, and the roof timbers seem in the perspective view to be of excessive weight. The roof is covered with tiles. "Polyanthos" is the title of a very fair design. The style is plain Early English, bordering on the transitional. The tower is at the south side of the chancel. The roof, which is tiled, is simple. The architect appears to have kept the limit of the funds in his mind throughout, as, though without meagreness, the building is far from having ornament to spare. "Bucks" is the motto of a rather gay affair for £10,000, in the Early Decorated style. The roofs are of good pitch. The tower, which is to the east at the side of the chancel, is really handsome, and there is a great deal of variety on the plan. It is a pity that no interior perspective is given, as we are sure the effect would be uncommonly good. In deference to the requirements of the Church Building Society the seats in the transepts face to the east, though in most of the other designs they face to the north and south like choir stalls. "Square and Compass" has a roof forming a right angle, than which there can scarcely be a more disagreeable pitch. The general style of the church is Geometrical, but a hammer-beam roof is introduced. It would appear as though the original roof had been destroyed and another substituted at a later period. The roof is covered with slate. The tower is a fine feature, but it would be improved by the omission of a few of the gablets. "Square and Compass in a circle" is a curious production of more originality than merit. The tower, which is in the centre of the west front, is flanked by two indescribable edifices, each apparently of two storeys, and rising nearly to the height of the main roof, the cornices being on the same level. The lower portions contain the porches, but to what purpose the upper part can be applied we have no notion, unless it be to form a porch of extreme height, which will be something like a well. As it appears in geometrical elevation it is as comical a thing as can well be conceived. The style is Early Decorated, with a waggon-headed ceiling. The effect of the interior is pleasing. "Sursum corda" is the motto given to a very ambitious design, as peculiar in plan as in elevation. It has a nave about 40ft. in width, which practically contains all the seats. At each side of the nave is a narrow passage called an ambulatorium, exactly 6ft. wide in the bays and 4ft. in the arches. In each bay is a bench, as there is no room for a seat with a front. These ambulatories lead to the vestry on one side and the organ chamber on the other, and excepting as corridors are useless. At the western end are two small towers or turrets and a hideous pent-house porch extending the entire length of that front. The entire west end of nave, a space some 30ft. in width, is filled by a rose window and an arcade of seven single-light windows: the very spandrels are pierced. It is as ornate as the style will allow, indeed much too fine. The ceiling, which is arched and boarded, is the best part of the design. The chancel, being apsidal, defies the instructions, and is too short. It has three rows of choir seats. This design is exceedingly monotonous, full of glass, and very expensive. The perspective views are effective, and we are far from saying that the architect could not do a really good thing, though in this case he has failed, as, with all his ambulatories and apsidal arrangements, the external appearance of the building is like anything but a fane of the Established Church. "Ad majorem Dei gloriam" is by the same hand, as is also "Bid temples worthier of the faith ascend." The former is a very good motto tacked to a very bad design. The sides are plain beyond measure, while the east and west fronts are gorgeous to a degree, the spandrels of the roof being filled in with tracery approaching the Flamboyant in style. In his report the architect lays the blame on Salisbury Cathedral, "where geometrical tracery was coming into use for the larger windows at east and west ends." In our opinion the tower, for want of sufficient buttress, would not stand. The third, "Bid temples, &c.," is the most extraordinary design we ever saw. It consists of nave and aisles of nearly the same height, the difference being only three feet. The building is nearly square on plan and elevation. Being vaulted there are five gables on the north side, six on south, and, if the apsidal plan of chancel prevails, five on the east. The style is Transitional. The architect talks about a "narthex" or western porch. This narthex takes the form of a pent-house cut into by a gabled porch opposite the nave and aisles, altogether a most notable device. "Triangles intersecting." This is a plain Early English design, solid of wall and showing value for the money it would cost. The tower is as handsome as any we have seen, and the entire church has a thorough old look, though no old church of this size was ever completed in one style, building being anciently so slow that a generation would pass away before a church of even moderate pretensions would be completed. It is impossible to describe this church so as to say wherein its especial charm lies, unless it be in the even distribution of its moderate amount of ornament. The interior is as good as the exterior, and both are excellent. "Floret qui laborat." This design does not require any extended notice. However much the architect may have laboured at his architecture he certainly does not flourish in it. The interior perspective view is one of the very worst that we have seen. The style, if anything, is Decorated, and the decoration is rather in excess of the style. The metal cresting to the roofs is objectionable, and the roofs are of too low a pitch. The plan is not a bad one. "In domine confido" is the title of the last in the collection. It has no feature of interest, being just like any other church in the same style which does not from especial cause rise above mediocrity. The archæology is right enough and propriety pervades it. There are worse designs in the competition and few better. Our own selection would be "Triangles intersecting," for the first, and "Polyanthos," for the second premiums.

DESIGN FOR THE MANCHESTER NEW TOWNHALL.

Our lithographic illustrations this week show two views of the admirable design submitted by Mr. Worthington, of Manchester, for the Manchester New Townhall. In the Building News for the 17th of April (No. 693), we gave an analytical notice of this meritorious work. A glance at the two views given will, we think, justify what we then said.

CHANGES.

The whirligig of time brings many changes, not only in the opinions of men, but in the purposes to which buildings and building sites are appropriated. Many a pagan fane has become a christian temple, and sometimes a christian temple is turned to unchristian uses. We remember some years since there was no small stir made in a portion of the religious world because the cellarage of the Wesleyan Centenary Hall, in Aldersgate-street, was used as a large wine vault. Percy-street Chapel, Fitzroy square, was at one time, and within the last twenty years, filled to overflowing, Sunday after Sunday, by a fashionable West-end audience. This was during the ministrations of the Rev. Haldene Stewart and his successor, the Rev. Robert Montgomery. The last-named gentleman was not only celebrated as a preacher, but famous as a poet. After his death, in 1855, the congregation diminished. Several ministers were tried, and after many strenuous efforts were made and many clergymen lost time and money in the struggle the chapel had to be closed. On the site of the once famous chapel have just been erected extensive premises for carrying on the wine trade. Possibly a teetotaller would say—To what base uses must we come at last.

THE STONEMASONS AND MR. GLADSTONE.

It will be remembered that when Mr. Gladstone had an interview or conference with the representatives of the trades' unions, he condemned in strong language a rule which he understood existed among masons, to the effect that stone which is quarried may not be dressed in the quarry, but must be taken to the place where it is put into the building. Mr. Gladstone went on to say that "such a rule was worthy of savages," as it was a waste of human labour. Mr. Gladstone said, "It is refusing to make God's gifts go as far as he intended them to go, when you require labour to be done by such a useless regulation." Some of the representatives present, including Mr. George Potter, said that such was not a trade unionist regulation, and Mr. Gladstone said he was glad to have his mind disabused. It turns out, however, that such a rule does exist, and that it is sanctioned by the Stonemasons' Union. The stonemasons of Birmingham are at present on strike to compel the master builders to adopt a code of rules, including the following:—"No worked stone to be allowed to come into Birmingham, with the exception of tooled York flags, common tooled steps, and the like." This strike has now existed for nearly a month, causing, as a matter of course, loss and social irritation. That the local strike is sanctioned by the Stonemasons' Society is too evident. On Friday last, at the Birmingham Police Court, John Ellis, late secretary to the Birmingham Stonemasons' Society, was charged with absconding with £50, which was sent to him by Mr. Richard Harnett, secretary of the Operative Stonemasons' Society, Bolton. This money was sent to sustain the Birmingham masons on strike, and it cannot be denied that one reason which induced them to strike was to enforce an obnoxious rule—a rule, as Mr. Gladstone says, "worthy of savages." There are other points in dispute between the stonemasons and master builders of Birmingham—points which are legitimately subject to local arrangement. But the rule above alluded to runs counter not only to the teachings of political economy, but to our ordinary conceptions of justice, and the sooner it is abandoned by the masons of Birmingham, and repudiated by the Operative Stonemasons' Society of Bolton, the better for all.

The office of surveyor to the Hon. Society of Gray's Inn is now vacant.

THE COST OF LABOURERS' DWELLINGS.

ON the 20th inst. Mr. Bailey Denton read before the Society of Arts a paper "On the Condition of the Agricultural Labourer." The question is a wide one, and Mr. Denton threw considerable light on it. He spoke of wages, education, beershops, provident societies, bakeries, garden allotments, labourers' homes, and other matters appertaining to the daily habits and life of the agricultural labourer. It is not our province to enter into the merits of any of these questions at the present time, but we feel bound to correct some misstatements which were made on the occasion in reference to the prices at which houses for agricultural labourers can be built, and particularly by some of the gentlemen who took a part in the discussion. Mr. J. K. Fowler, of the Prebendal Farms, Aylesbury, said "it was impossible for an agricultural labourer to pay, as rent, interest on £140. He, Mr. Fowler, had, through his landlord, to build one or two cottages, and he found they cost from £130 to £140 each." And Mr. William Hawes, the chairman, said "that the Society of Arts had again and again considered the question of improved dwellings. They had plans prepared and every scheme suggested for reducing the cost, but they could not bring it within £130. They could build a hovel for a good deal less, but not a cottage fit for a labouring man to live in." We give full credit to the society for what it has done in this direction, and at the same time venture to say that it has not exhausted every scheme for building cottages, if £130 is the minimum cost. We beg to call Mr. Fowler and Mr. Hawes' attention to a few instances which contradict their experience. Some time since the Central Cottage Improvement Society offered a prize for the best plan of a cottage, consisting of a good living room, scullery, and pantry, with three bedrooms. The prize was won by Mr. Smith, and since then Mr. Hill, of George-lane, Snaresbrook, has built a cottage on the plan for £105, and is prepared to build as many as may be required in the same way for the same money per cottage. If the cottages are built double they can be produced at a cheaper cost. Mr. Thomas Kibble, of Greentrees, near Tonbridge, a gentleman who has paid considerable attention to the question of economy in building cottages, has recently erected some double cottages, each cottage consisting of living room, scullery, and pantry, and three bedrooms, and these double cottages have been erected for £175 each. Mr. Nichol, of Regent's Circus, another gentleman who has studied this question, has recently erected a triple cottage at Hampton for £250. This plan was illustrated in the BUILDING NEWS, No. 602. Mr. Nichol is now putting up sixteen similar cottages at a similar rate at Twickenham. Mr. Nichol has a system of his own. He builds with slabs instead of bricks, and competent authorities have stated that cottages built on this system are as strong and even stronger than if built with ordinary bricks. We shall have more to say on Mr. Nichol's plan of building soon. The Rev. Hales Tooke, of Washbrook, near Ipswich, has built triple cottages, of good brickwork, and on a similar plan at £225 each. It should, however, be borne in mind that Suffolk is a cheap county both for labour and material. We give these facts to show that the gentlemen who offered observations on this important question of providing better house accommodation for labourers at the Society of Arts were misinformed. It is, we think, sufficiently demonstrated that good substantial cottages can be built for £100 per cottage; if built in a double form they can be produced cheaper, and if in a triple form, at a much cheaper rate.

THE METROPOLITAN BOARD OF WORKS IN BAD ODOUR.

THE Metropolitan Board of Works, whose enemies, says the *Daily News*, seem to increase every year, is getting into peculiarly "bad odour" in Essex, and may find itself involved in serious Chancery proceedings for its doings in certain portions of that county which lie on the margin of the Thames. From a petition to the Home Secretary which has been signed by the vicar, the churchwardens, the medical men, and, indeed, by all the inhabitants of Barking, we learn that the place is being made positively uninhabitable by the operations of the Board. The public has heard something like this before. Last November, the Vice-President of the Board of Trade stated in Parliament that owing to the continuous silting up of the river by the deposition of sewage mud from the outfall sewers of the Board, a bank had been formed in the channel of the river upon which one vessel had been stranded. It now appears that the depth of water in the channel has been diminished from 21ft. to 10ft. at ebb tide, or, in other words, 11ft. of water have been lost. These Barking memorialists, however, do not complain in the character of navigators, but as residents desiring to live unmolested in their houses. The filth and refuse of the largest city in the world is deposited at their doors. There are banks within a few hundred yards of their houses composed of solid sewage, six, eight, and ten feet deep. Foreshores which were formerly hard shingle are now pestilential mud, and what were formerly valuable fishing grounds are now spawning beds of fever and cholera. All this has happened since the discharge from the high and middle level sewers of the metropolis began, and the evils will be exaggerated when the low level sewer is in operation. It seems strange that after all the cant about sanitary reforms with which the public has been bored for years, we should have to record such facts as these. The act under which the Metropolitan Board has been working, and under which its members justify their proceedings, is one for the purification, not the pollution, of the Thames. It does not prescribe or sanction any particular plan, but leaves the Board under full responsibility to those it may injure, even empowering the Home Secretary to proceed against them if they create a nuisance, and this the Barking memorialists entreat Mr. Hardy to do. We wish them well out of their troubles, without, however, seeing how either the Home Office or the Court of Chancery can help them.

A NEW WATERCART.

A NUMBER of improved watercarts are being built for the City of London, by Messrs. Bayley and Rawsthorne, of Newington Causeway. The principal improvement is the better regulation of the flow of the water by means of a simple and ingenious arrangement. There are two distributing pipes, into either of which water is admitted by means of a valve. The upper distributing pipe has double the number of holes that are in the lower one, and consequently can be used to deliver a larger amount of water on new roads, and where else needed. Springs also are introduced to support the cart, preserving it to a great extent from the effect of blows and concussions. The body of the cart is galvanized and so oxidation is prevented. The general construction of the cart is considerably improved. It is hung on a crank axle which brings it very near the ground, so that the flow of water lays the dust better than if thrown from a greater height. The valve regulating the slow or quick flow of the water is set before starting, as required. Altogether the cart is a decided advance upon the primitively constructed watercarts at present in use.

THE POLLUTION OF RIVERS.

THE *Engineer*, in an article on this subject, says that viewing the exclusion of sewage matter alone from our running streams and brooks as a half measure, and not calculated materially to increase their purity, the remaining step to be taken by the Legislature is to forbid anything except storm waters and surface drainage to be added to their contents. The true value of the prohibition to run sewage matter into rivers is not to be sought for in the diminution of their pollution, but in the necessity it creates for the utilisation of a valuable manure. Strictly speaking, no drainage of any kind can do otherwise than impair the purity of a stream; and the surface water flowing into rivers from farm lands and farm-yards contributes materially to discolour and contaminate them. The law with respect to discharging refuse or material of any kind into streams appears to rest upon the somewhat extraordinary foundation, that although one's next door neighbour may send tons upon tons of pollution into them, the same privilege does not extend to one's self. That one party should have a right to pollute a river until it is nearly as filthy as the Augean stable, and that another should not be able to discharge a drop of contamination into it, is a state of the law as anomalous as unjust. It will scarcely be credited that such a thing exists as a "prescriptive right to befoul a river." Yet it is so, unquestionably. Last session in the Vice-Chancellor's Court two cases of river pollution were heard, in which the fact was clearly established. Consequently our rivers may be treated as sewers by some, but not by others. Twenty years of uninterrupted passage, we believe, give a right of way in the case of land; we have yet to learn how many give a right to pollution with respect to streams. The evil being grave and palpable, the remedy must be stringent and conclusive. In common fairness, two courses appear to be open. One is to abolish all prescriptive rights and allow the river sewers to be free to all proprietors of manufacturing and industrial establishments; the other to forbid them in like manner to all, whether they have recently set up works or have been proprietors since the time of the Conquest. It is needless to say of the first course that it is not desirable that our rivers and streams should be rendered public sewers. There remains, therefore, no other but the second. To put into peremptory execution an alternative of this character would be fraught with manifest injustice to the possessors of manufacturing premises. Corporations consider it bad enough to be compelled to find a different outlet for their sewage than what they have been accustomed to, but still sewage can be utilised—it is indisputably a fecundatory medium, and should be treated as such. The case is otherwise with the refuse of manufactories. There is no doubt but that it might be all utilised, but neither the knowledge nor the means of doing so are at present before us, and to force such a conclusion as an ultimatum upon the present proprietors would be a harsh and unwarrantable exercise of authority, and would inevitably be followed by the closing of many large premises, which afford employment and maintenance to the inhabitants of the surrounding districts. In precisely the same manner in which the sources of the beautiful aniline dyes were formerly disregarded and thrown aside as rubbish, as a thing to be got rid of, so are tons of material allowed to flow away and to ultimately reach the sea, which never restores the treasures once committed to its depths.

DOBROYD CASTLE.

ON Saturday last was celebrated by a dinner the finishing of Dobroyd Castle, which has been erected near Todmorden by Mr. John Fielden. A large number of ladies and gentlemen were present. Mr. Fielden, as on the occasion of laying the foundation stone, provided the dinner, which was heartily enjoyed by all the men who had co-operated in rearing the castle. Two presentations were made during the evening, one to Mr. W. Glover, clerk of the works, and another to Mr. Edwin Long, foreman of the masons. The chair was taken by Mr. William Glover, who said in his opening speech:—"It is now a year and seven months since we met to partake of the kind hospitality of John Fielden, Esq., to commemorate the laying of the foundation stone of Dobroyd Castle. We now meet under the same auspices to celebrate the roofing of a building which will immortalise the name of Fielden,—be a monument of art to one of the greatest architects of the nineteenth century, an honour to the contractor, a credit to the foremen and workmen, and of the superintendence of which the clerk of works may feel proud. It is a structure the exterior of which has been raised from the native sandstone rocks, and lined with bricks made from the native clay, and, like the parent rock of the castle, it will resist the action of time, and speak to a future age of a name dear to the sons of toil, and of the triumph of building art in the present century. Two years have now

passed since the first sod was turned. During that time 35,000 cubic yards of excavation have been completed for the castle and roads connected therewith: upwards of 6,000ft. of drain pipes have been laid, and more than 1,000,000 bricks have been made and used. Two quarries have been opened, 120,000 cubic feet of stone has been taken from the beds of these quarries, besides 33,000ft. for 'metalling' roads; 8,000ft. of timber, 33 tons of iron, and 8,000ft. of Bath stone have been used in and upon the castle. It is an interesting fact, in connection with these works, that no accident of any moment has occurred in the whole period."

The evening was spent most agreeably. The erection of this castle reflects credit on all concerned. There appears to have been harmony between the architect, the clerk of works, the foremen, and the men, and that from the beginning they have worked with energy and satisfaction. Mr. John Gibson is the architect.

LABOURERS' DWELLINGS.

A PAPER was read before the Society of Arts, on Wednesday evening, by J. Bailey Denton, on "The Condition of the Agricultural Labourer." After reviewing the wages and social position of the labourer, the lecturer concluded with the following remarks:—

Thus far I have spoken of those means of improving the condition of the agricultural labourer which will depend on himself and the force of education gained at school and on the farm. There are other means, however, by which the higher and middle classes in rural parishes may render material aid while the seeds of education are taking effect. I have said *may* render aid, because all Englishmen resist compulsion; but I feel those words are hardly strong enough when applied to some objects. I would rather say, will be induced to render aid by the influence of public opinion. I refer to four principal objects—first, to a more general substitution of good cottages for bad ones—cottages which will secure health and comfort in the ordinary living department, and provide separate bedrooms for the parents and children of different sexes, so as to secure comfort and decency, which have hitherto been incompatible with the dwelling of the farm labourer; second, the provision of a proper means for the drainage of villages and cottages, and the utilisation of the refuse which may be discharged from them. This is a matter upon which little has yet been done. We have drained large towns, and discharged their sewage into the rivers, a practice which the country has determined shall not be continued. At present we have not entered upon a mode of dealing with the sewage of villages and small communities; and whether it will be by the introduction of the dry earth system (Mr. Moule's), or by any other process of utilisation, yet remains to be determined. The dry earth system commends itself to the minds of many as the most suitable for villages, because each resident may preserve the refuse of his own cottage for the benefit of his garden without injuriously affecting his neighbour; and this being a very desirable object, the problem has to be solved how, by combined action, all the residents of a village may be brought into one common system of proceeding. As the wage-paid labourer cannot of himself do this, it would appear positively necessary that the owners of village property should take the initiative. Third, the supply of pure wholesome water in quantity sufficient to secure cleanliness and comfort to villages and cottages. I have already addressed the society upon this important object, and will abstain from repetition. The supply to large towns is an easy matter, compared to the provision of villages and small communities. But with our whole water supply undergoing change from causes we cannot control, and our village cottagers called upon to pay as much as a penny per pail for water, the subject must soon receive attention. And, fourth, the provision of ground for the recreation of those children which it is by common consent determined should be educated.

I will address myself to those objects in which the upper and middle classes of rural parishes may voluntarily assist the lower class. Foremost amongst them are benefit societies. Of all things which the labouring man most dreads is his condition in his last days. By subscription to local societies (if well managed) a labourer may, under the present state of things, contrive to obtain the means of support if sickness overtakes him, but a provision for old age is an object which very few agricultural labourers secure. If the earnest interest of the superior classes in a parish could be manifested by taking a part in the management of benefit societies, very great good would attend them, and it would no longer be said that out of the 23,000 friendly societies which exist in England and Wales there are not 20 solvent.

Some few existing societies are excellent precedents for the establishment of others. The Essex Provident Society has enrolled between 9,000 and 10,000 members, and has a capital of between £70,000 and £80,000; and the Hampshire Friendly Society has upwards of 3,000 members and a capital of £35,000. The Hitchen Friendly Institution, established in 1828, is, perhaps, based on as good a foundation as any in the country, as every member who insures against sickness is also compelled to insure for a pension in old age, an object declared by Mr. Hawkins, its founder and great supporter, to be of "vital importance if the wage-paid classes are to be taught the advantage of respectability in providing for themselves when past work without application to the parish."

The next object in which the higher classes can help the lower is in establishing and maintaining garden allotments under a provident system of management, by which a labourer having allotted to him a rood of land may pay during his active life a rent more than sufficient to satisfy the landowner, but which it is quite worth his while to pay to secure the profit which the gardening of a rood of land will give. In the majority of cases a landowner who would not let a single rood of land to the labourer would let a plot of many acres to the parish authorities, and would be quite satisfied in receiving say £2 an acre, tithe free, which is equal to 3d. a pole or 10s. a rood. If the labourer paid 6d. a pole, or £1 a rood, tithe and rate free, he would be paying double the acreage rent that would satisfy the landowner, and if the surplus was invested through the same agency as that of the "Post-office Benefit Societies," it would accumulate so as to provide the rent of the land after a certain number of years, whereby the labourer in his latter days would hold the land rent free. Thus he would ensure one means of support. But such an advantage can only be gained by the combination of the more wealthy parishioners, who together might become security to the landowner for the principal rent. Again, village hospitals and infirmaries, enabling the labouring class who have lived a worthy life to gain proper medical advice and nursing at home, are working well where properly managed, and are fit objects for benevolent co-operation. But besides these there is still another, in which the upper classes may do much good. We have recently heard much of co-operative societies for reducing the cost of provisions and preventing extortion on the part of London tradesmen. Without entering upon the question of whether such societies are desirable or beneficial for those they were originally intended to assist, it is quite certain that a modification of them may, with great advantage, be carried out in villages for the supply of food and clothing to the labouring population in rural districts. At present there has been very little experience in co-operative stores in villages. There is no doubt, however, that the small wages of the agricultural labourer are much reduced by tribute to the local tradesmen; and with so little to spend as the labourer has, it is indeed desirable that that little should purchase as much as it can be made to do. One condition would be paramount, and that would be, that ready money should be the only means of purchase, but as this requirement would produce provident and careful habits it could not eventually militate against success.

ARCHITECTURAL SOCIETIES.

A MEETING of the Oxford Architectural and Historical Society was held on Wednesday, May 20. A lecture on "Monasticism" was given by Charles Appleton, Esq., M.A., St. John's College, who traced its history and described the various forms which it had assumed at different ages, and discussed the views which had been held by recent historical writers and philosophers on the subject. The lecture was followed by some remarks on "The Recent Discovery of Wall-paintings on the Apse of Checkendon Church," by E. G. Bruton, Esq. The church is one of those rare examples of an original apsidal eastern end, and it was probably built early in the twelfth century. Mr. Bruton described the steps by which the paintings were discovered, and his reasons for thinking they were painted shortly after the erection of the church. When complete, they consisted of the twelve apostles, equally divided, and ranged on either side of the walls, north and south of the east window; but the southern half had been reduced to three or part of four figures in the fifteenth century, by the insertion of a window. Some parts of the figure of our Saviour, seated on a throne, with both hands raised in the act of benediction, were discovered on the vault, immediately over the east window. The figures of St. Peter and St. Paul were arranged north and south of the east window, and were distinguished by being placed in panels or niches, while the others were not so separated; and to these saints the church is dedicated. A curious ivory carving of the eleventh century was exhibited by Mr. Borlase, on which Professor Westwood made some interesting remarks.

PARLIAMENTARY NOTES.

On Thursday week the City of London Gas Bill was read a third time in the House of Commons and passed.

On Monday night Mr. Henderson asked the Secretary to the Treasury why so much time had been wasted, and the best season of the year for building purposes allowed to pass away, without any progress having been made towards the erection of the new county courts in the city of Durham, Government having purchased and had possession of a site for that purpose several months, and the house where the present courts were held being most inconvenient and entirely unfit for the conduct of public business. Mr. Sclater-Booth explained that the purchase of the premises was not for the purpose of building county courts. The reason why the new buildings were not proceeded with was, that the estimates were very large, and that the accommodation could be provided in a much better manner elsewhere.

LABOURERS' DWELLINGS' BILL.

In the House of Lords on Tuesday night, Lord Chelmsford moved the second reading of the Artisans' and Labourers' Dwellings' Bill. His lordship expressed himself anxious that the measure should become law this session for the reason that it would tend so greatly to promote the health and comfort of the labouring classes. He referred to the reports of the medical officers of Liverpool and Manchester to prove that the effect of overcrowding in our large towns was something terrible, and thought that the House would agree with him that it would be a reproach to the legislature if this great and growing evil was not remedied. Former measures of a similar character have proved abortive, first, because they were merely permissive and next because local authorities from various motives shrunk from using the powers entrusted to them. On the whole, therefore, he felt that it would be infinitely better to entrust the execution of the act to the Board of Works. Then as to the objection of local taxation. The property that would be destroyed consisted chiefly of two storeyed houses, and by replacing them with buildings four or five storeys high accommodation would be provided for an immensely increased number of tenants. There would thus never be any burden on the rates, and if the new houses were sold the debt incurred in building them might be at once extinguished. He hoped therefore that their lordships would give a second reading to a bill which would bring comfort and health, and he might add decency, to thousands upon thousands of families to which all were alike strangers. He regretted that Lord Portman should have suggested its reference to a select committee; but feeling that it would be useless to struggle against such a proposal, he would reluctantly assent to it. He should, however, himself attend the committee, and he was happy to add that he had secured the services of a noble and learned lord opposite. The Earl of Shaftesbury thoroughly approved of the measure and expressed himself most anxious for the second reading of the bill. The Bishop of London said one point of some importance was the difficulty which was often experienced in obtaining good titles for land on which it would otherwise be desirable to erect improved cottages. An instance of this had occurred in the very heart of St. James's, and he hoped that care would be taken

in the more complete framing of this measure that this difficulty should as far as possible be obviated. He hoped the bill would be so dealt with by the select committee that it would prove an effective measure, in which case he was sure it would be of incalculable advantage to the metropolis and elsewhere. Lord Portman said, as the owner of a considerable amount of house property, he was prepared, notwithstanding the remarks made in the newspaper referred to by the noble and learned lord who had moved the second reading of the bill, to oppose in its present form a great deal of the bill, and to take upon himself the peril with which he and others who might take a similar course were threatened. He should do his utmost to make the bill a good one, instead of leaving it, as it was at present, the most crude and dangerous piece of legislation that for a long period had come up from the other house of parliament. He wished to point out that it was impossible, even with the assistance of trades unions, or in any other way, that the expense of the buildings it was intended to erect could be repaid within seven years. One fault in the bill was that it did not require specifically the erection of dwellings for artisans and labourers; it simply provided for the erection of dwellings fit for human habitation, and of course under such a generalisation it was quite possible to erect dwellings suitable for their lordships. He desired to point out as an omission he had noticed in the present bill that no provision had been made to meet the case of tenants for life; and, again, he thought there ought to be a better definition of the term owner than was given in the bill. The Duke of Marlborough and the Earl of Derby each cordially supported the second reading. The latter nobleman thought that the bill failed to touch one serious evil—the overcrowding of cottage property. Another point he hoped the committee would bear in mind was the better definition of the term "owner." He trusted that an arrangement would be made that should bring about an equal distribution of the burdens upon property, and that the responsibility of owners would be carefully considered by the committee. The bill was then read a second time, and ordered to be referred to a select committee.

WATER SUPPLY AND SANITARY MATTERS.

The inhabitants of the little Scotch town of Leven experienced considerable loss last summer in consequence of the presence of very few visitors, many being doubtless kept away by the knowledge that the sanitary condition of the place was anything but satisfactory, and that a severe outbreak of cholera had occurred in 1866. The townspeople accordingly adopted the Police Act, and established a Board of Commissioners, who have procured for the town a good water supply, a system of drainage, and a great improvement in the condition of the streets. The engineer's estimate for the works was as follows:—Water-works, £1,204 15s.; drainage, £1,227 12s.; street improvements, £1,321 14s.—total, £3,754 1s. The plans of the waterworks were originally furnished by Mr. Sang, Kircaldy, but were afterwards altered and considerably extended by Mr. Andrew Paterson, architect and surveyor, Leven. The whole of the drainage works have been carried out in accordance with designs prepared by Mr. Paterson, and under his superintendence; and the contracts have been executed by Messrs. Arthur and Co., contractors, Meigle.

Colonel Sir W. Denison, Dr. Frankland, and Mr. John C. Morton, the commissioners appointed to inquire into the pollution of rivers, held a preliminary investigation at St. Helens, on Saturday, into the pollution of the Sankey Brook and the St. Helens Canal, which receive the refuse of a large number of chemical and copper smelting works. The Sankey Brook previous to the erection of these manufactories, was a clear stream; but it is now so polluted that in some parts of the borough it emits an exceedingly unpleasant odour. Fish have entirely disappeared from its waters. The Commissioners purpose to forward a number of queries to the witnesses whose names they have obtained, and afterwards to hold a further investigation.

A bill has been brought in by Mr. Clive, Mr. Goldney, Mr. Neate, and Mr. Wyld, to make better provision for facilitating and regulating the supply of pure water in cities, towns, and districts throughout the United Kingdom of Great Britain and Ireland.

Building Intelligence.

CHURCHES AND CHAPELS.

The chief stone of a new Wesleyan Chapel has been laid at Swindon. The style is Decorated Gothic. Accommodation is provided for nearly 1,100 persons. The chapel is 69ft. 6in. wide, 88ft. long, and 20ft. high from floor to ceiling. Mr. T. S. Lansdowne, of Swindon, is the architect, and Mr. T. Barrett, of the same place, the contractor.

On Thursday week the foundation stone was laid of a new church for the parish of Mordington, near Berwick. The style is Decorated Gothic, and the church is to accommodate 170 persons, at a cost of about £1,200.

Holy Trinity Church, Barnstaple, which was only completed in 1847, at a cost of nearly £10,000, has been declared to be in a state of complete dilapidation. It has been, therefore, resolved to almost entirely rebuild it at a cost of about £2,000. The architect of the restoration is Mr. W. White, F.S.A.; the contractors are Mr. J. Pulsford (stonemason), Mr. J. Cocks (builder), Mr. John Hartnoll (carpenter). On the corner stone, at the east end, which might be moved by a push, is inscribed "Built upon the foundation of the apostles and prophets, Jesus Christ himself being the chief corner stone." It seems a pity that the builder did not depend a little more on the strength of his material foundations.

Willesborough Parish Church was reopened on Sunday last, after complete restoration and enlargement, under the superintendence of Mr. I. Pearson.

On Saturday last the corner stone of a new Baptist Chapel and Schools was laid at West Vale, near Halifax. The total cost will be about £2,000.

The parish church at Moulton, in the county of Lincoln, has just been reopened by the Lord Bishop of the diocese, after having undergone considerable repairs and restoration. It is one of those large churches for which the county is so famous, and consists of an Early Pointed nave with north and south aisles 92ft. by 51ft., a Perpendicular chancel 48ft. by 20ft., and western tower and spire about 170ft. in height. A new south porch takes the place of a comparatively modern one of poor design, and a vestry with organ chamber has been added at the east end of the north aisle. The new seats and doors are of English oak, the walls and windows have been restored, and the roofs repaired and re-covered with lead. The cost of the work has been upwards of £3,000, and to meet this outlay the parish have agreed to borrow £2,000, the remainder being raised by subscriptions. The whole of the works have been executed by Mr. W. Brown, of Lynn, under the direction of the architect, Mr. William Smith, of John-street, Adelphi.

On Tuesday, May 19, a new church was opened at Melton, near Woodbridge. The style is Decorated English, and the architect, F. Barnes, F.R.I.B.A., of Ipswich. The church consists of nave, chancel, and north aisle; the entire length is 106ft., and the width of nave and aisle 60ft. The building is of Kentish rag with Bath stone quoins and dressings; on the south side is the tower and spire rising to a height of 90ft. The lower part is used as a porch, above which is placed the clock, the gift of J. Packe, Esq., of Melton Lodge. The internal fittings are all of oak, without oil or varnish of any kind. The benches in the nave are quite plain, those in the chancel have carved poppy heads. The entire building has been erected at a cost of about £4,000, which has been raised by voluntary contribution. The whole of the work has been executed by Mr. Henry Luff, of Ipswich, under the superintendence of the architect.

The foundation stone of a new Episcopal Church was laid at Kelso on Monday. The church, which is to cost £3,500, consists in plan of nave, north and south aisles, and chancel, with organ chamber on north side, and vestry. The nave and aisles are seated for a congregation of about 350, and the chancel is stalled for priests and choir. The style adopted is Early Geometric Gothic. Mr. R. Anderson, of Edinburgh, is the architect.

Another, and the last but one, of a series of carved panels illustrating Old Testament history, has been placed in the canopies of the choir stalls in Ely Cathedral. The work of renovating the defective portion of the south walls and buttresses of the choir is proceeding satisfactorily.

On Holy Thursday the foundation stone of a new church, dedicated to All Saints, was laid at Burton in Lonsdale, Yorkshire. The building will be in the Early English style of architecture, and will comprise a nave, north aisle, chancel, north porch, with tower and organ chamber on the south side, and a vestry on the north. A tower, with spire, will rise to the height of 130ft. Accommodation will be provided for 350 persons, at an estimated cost of between £7,000 and £8,000. Mr. Paley, of Lancaster, is the architect.

A new Wesleyan Chapel at Hendon was opened on the 15th inst. Mr. John Tillman, of Sunderland, was the architect, and Mr. J. C. Tone the contractor. The chapel, with its vestries, adjacent schools, and playgrounds, occupies a plot of ground 80ft in breadth by 176ft. in length. It is built of freestone, in regular courses, the outer surface of the stone being left rough. The chapel will accommodate from 800 to 1,000 people.

BUILDINGS.

The Commercial Bank of Scotland have just completed a new bank at Galashiels. It is in the Italian style of architecture, three storeys in height, and relieved by elaborately carved bands, cornices, pilasters, floral tresses and lion's heads. Mr. David Rhynd is the architect.

The latest addition to the attractions of New Brighton, an improving watering place on the Cheshire side of the Mersey, is the erection of a promenade pier. It is in connection with the landing-stage, but occupies a considerably higher level, and consists of an embayed platform, resting on iron pillars sunk into the rock. It is 551ft. in length, and varies in breadth from 70ft. to 130ft. Two pagodas have been erected on the promenade, which are used as bazaars.

Within a fortnight the erection of a block of buildings will be commenced at Hanging Water, Sheffield, for the accommodation of forty-eight poor people. The buildings will consist of thirty-six almshouses, the cost of which, about £24,000, will be borne by Mr. Mark Firth, the master cutler. Mr. Firth will provide for the allowance of 7s. a week each to the single and 10s. a week to the married occupants. The site will cover two acres of land.

The people of New South Wales have resolved to erect an hospital as a mark of their thankfulness for the escape of Prince Alfred from assassination. The hospital is to bear his name. Upwards of £4,000 has been already subscribed.

A new bank for Lloyd's Banking Company is about to be erected at Longton, Staffordshire. The building will be a plain substantial erection, consisting of bank and suitable premises with manager's residence, erected from the plans of Mr. J. Burrell, architect, and built of red brick, with stone dressings. The tender of Mr. Barlow, of Stoke-upon-Trent, was accepted, subject to certain conditions. The building is expected to be finished by the end of the year.

A new boys' school has been opened at Ledbury, by the liberality of a townsman. The building includes a school, class rooms, and a master's house, and has been erected at a cost of £1 629 17s. from the designs of Mr. Kempson, architect, of Hereford.

On Tuesday the foundation stone of Holy Trinity Ragged Schools was laid at Toxteth-park, near Liverpool. The estimated cost will be about £1,600. The building, which will be of brick with stone dressings, is intended to accommodate between 300 and 400 children, there being two principal rooms, one of which is to be used as a lecture room, besides a class room. Mr. George Williams is the architect, and Mr. Andrew Muir the contractor.

A building, for the use of the Royal Geographical Society, is to be built facing the Thames Embankment, the site having been promised by the Commissioners of Crown Lands.

The directors of the Agricultural Hall Company are about to build a new musical and theatrical structure, and have called for tenders. Builders wishing to tender may apply to the architect, Mr. Frederick Peck, 15, Furnival's Inn, E.C. The company offered premiums for designs, and, after awarding the first to Mr. Knightley, and the second to Mr. Giles, finally determined, under certain conditions, to entrust the execution of the work to their own architect, and they have done so.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, FAYISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—H. R. M.—I. R. T.—I. H. C.—B. W. W.—W. J. B.—F. C. I.—A. S.—C. B. A.—W. H. D.—W. L.—I. R. I. A. H.—I. B. N.—I. and T. H.—I. M. S.—A. H. D.—H. H. S.—T. G.—"Not for Joseph."—C. B. A.—R. M. and Son.—P. A.—W. B. C., with photographs of designs of Manchester new Townhall.—R. M. and Son.—I. R. T.—P. F. W. R.

ERRATUM.—A mistake occurred in our announcement last week in reference to the new warehouses about to be erected in Huddersfield. It should have been stated that the warehouses were to be erected on the estate of Sir J. W. Ramsden, and that the architect selected was Mr. W. H. Crossland

Correspondence.

MR. MOORE'S DECORATIONS.

To the Editor of the BUILDING NEWS.

SIR,—In a prominent position on a screen at the Architectural Exhibition is a coloured section of the new Queen's Theatre, showing a certain scheme of decoration, as "suggested by Mr. Albert Moore." Appreciating as I do Mr. Moore's painting, his harmonies of colour, and the Greek refinement which he always manages to infuse into his work, be it mere chalk sketch or finished painting, I am at a loss to understand how such an artist could have introduced such colours as those we see in this section. If we are to accept this drawing as an indication of Mr. Moore's capability to deal with the whole question of internal decoration, I am afraid Mr. Moore's chances of commissions for this sort of work are but poor. I do not deny the admirable treatment, simplicity, and harmony of the ornament, and the colour of the detail is in many respects excellent, and such as we should expect from this artist; but the general tone of colour upon pit, wall, and fittings is quite enough to prevent this design from ever being carried out. It is hardly credible that the painter of "Azalias" could have been guilty of suggesting such a drawing, and yet we are bound to conclude so, seeing that the only alternative would be to suppose that some one had altered Mr. Moore's suggestions or drawing, a course so impertinent that it is impossible to suppose anyone could be guilty of it.—I am, &c., A. Z.

TERRA-COTTA WINDOW—CERTOSA.

SIR,—You allude in your last issue to the magnificent cast of the lower window of the Certosa, near Pavia, which has been lately acquired by the South Kensington Museum. I venture to point out a slight inaccuracy in the description—namely, with respect to the material in which this window is executed. Terra-cotta of the deep red colour prevalent in the north of Italy is largely employed in the decoration of the other fronts of the building, and in the cloisters, but the west front, which contains the window in question, and which is perhaps the most richly decorated façade in Europe, is entirely of marble. The character of the design would naturally lead anyone unacquainted with the actual building to infer that terra-cotta must have been employed, but probably from the wish to bestow on the principal front a more costly and valued material, marble has been made use of here, as was frequently the case in brick buildings of this period in Italy. The marble chosen seems to have been impregnated largely with veins of iron and other impurities, and in the lapse of ages varied and richly coloured stains have spread over many of the blocks, thereby imparting to the front a tint much resembling the appearance of the terra-cotta work in England at the present day. The details of the ornament of the Certosa richly deserve the attention of the designer as, from their great variety, the lowness of their relief, and the skill with which they are adapted to and spread over the surface, they are eminently suited as examples for terra-cotta, one of the chief difficulties in preparing designs for this material being the small size of the blocks, requiring a style of ornament which may break up the flat surfaces and hide the number and unevenness of the joints.—I am, &c., GILBERT R. REDGRAVE.

UTILISATION OF WASTE HEAT.

SIR,—By Mr. Edwards's letter in your last week's impression I fear he has altogether misunderstood the remarks made by me on the utilisation of waste heat. I beg to state that I took no credit for introducing a new idea or even a new system of warming and ventilation, but simply an attempt in the simplest and cheapest form to make use of the waste heat from the rooms mostly used for increasing the temperature of bedrooms; and this not obtained only from the kitchen fire, but also from the ordinary register stoves.

Far be it from me to act in an "ungracious and unjust" manner, or to make use of others' ideas and start them as my own, but I fear that it would be uninteresting to your readers, and almost impossible without taking up much of your space, to enter into this subject; but I shall have much pleasure in taking an early opportunity of talking the matter over with Mr. Edwards. I am glad to have this means of expressing the pleasure I have had in reading Mr. Edwards's book (and which I have already twice expressed at the Association), and I beg to assure him it was simply in furtherance of his views, and not from any wish of mine to compete with him, that I bestowed a little attention on the experience of others. Trusting this letter will remove any false impression in Mr. Edwards's mind,—I am, &c.,
J. DOUGLASS MATHEWS.

Intercommunication.

QUESTIONS.

[869.]—AWARD AND AWARD MAPS.—Is there any office in London where copies of awards and award maps by the commissioners appointed to map out the different parishes in England are deposited?—M.

[870.]—DIFFERENTIALS.—Will any of your numerous correspondents oblige by informing me through Intercommunication what are the differentials of the following equations, so that the values of B and D in them may be of minimum value? And also if any of the equations can be expressed in a shorter or more concise form? W and H in the equations being constant quantities; B and D being the variable.—X + Y.

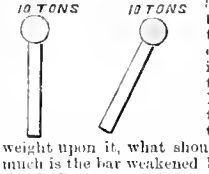
1. $W H \left(\left(D^2 + \frac{D}{2} \right) \left(\frac{D^2 + D}{3} \right) + B \left(D^2 + \binom{B + D}{2} \right) \right)$
2. $W H \left(\left(D + \frac{D^2}{2} \right) \left(\frac{D^2 + D}{3} \right) + B \left(D + \frac{B + D^2}{2} \right) \right)$
3. $W H \left(D^2 + B \binom{B + 3D}{2} \right)$
4. $\frac{W H}{2} \left(B \left(B + D \right) + \frac{D^2}{3} \right)$
5. $\frac{W H}{2} \left(\left(B + D \right)^2 - \frac{D^2}{3} \right)$

[871.]—LIMESTONE AND EARTHENWARE PIPE SEWERS.—I would thank some of your readers to answer the following:—Whether will a sewer made of limestone, 18in. square, or an earthenware pipe sewer, deliver the most sewage if both have equal fall? And how many cottages would either of them drain with a fall of 1 in 240.—A. B. C.

[872.]—TUBE WELLS.—Can you give me any information on the American tube well system, as to cost, &c., and facility, by its means, of procuring a supply of water?—W. C. (Edinburgh.)

[A short account of the system appeared in an article on "Artesian Wells" in BUILDING NEWS, No. 677.]

[873.]—INCLINED BARS.—Will any of your numerous correspondents solve the following question for me?—I have



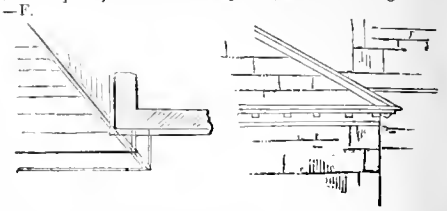
an upright bar of iron with ten tons upon it, as represented in the figure. What should be the diameter of the bar, supposing it to be round, to safely support the weight? Secondly, suppose I incline the bar, as shown in the cut, at an angle of 60 deg. to the horizon, and place the same weight upon it, what should be its diameter now? How much is the bar weakened by placing it in a sloping position?—STUDENT.

[874.]—EXPANSION OF RAILS.—How is the expansion of rails in the direction of their length provided for; and what would be the actual expansion of a rail, supposing it were 100ft. in length?—M. M.

[875.]—FORM OF GIRDERS.—What is the reason that some of the bridges carrying the various railways in and about London over the streets are of different shapes to the others? Why should some have the tops curved from the centre to the ends, and others be quite straight right through? Is it merely a fancy of the engineer, or is there any real difference in the strength of the girders by the shape being altered? Some information on this subject would be a favour to—AN OLD SUBSCRIBER.

[876.]—GEORGE FIELD ON CHROMATICS.—Will you, or any of your readers, kindly inform me, through Intercommunication, where I can get a work by George Field called "Chromatics, or the Analogy, Harmony, and Philosophy of Colours," and the price of the same?—A PAINTER.

[877.]—MANAGEMENT OF HIP.—What method can recommended for overcoming the objection of a hip cutting a main quoin, as hereunder depicted, the walls being built?—F.



[878.]—HANGING PAPER.—Can any of your correspondents inform me where I can get old bedroom or other paper matched? Perhaps there is some such house in the trade where builders and others resort to when they require anything of the sort. I have inquired everywhere, but hitherto unsuccessfully.—A SUBSCRIBER.

[879.]—GREENOCK DOCKS.—Being a competitor for Greenock Docks, a plan of which I sent on the 30th March last, and hearing nothing about it in your BUILDING NEWS, to which I am a subscriber, could you inform me, through your columns, if any decision has been come to?—W. NICHOLSON, 46, Wesley-street, Birkenhead.

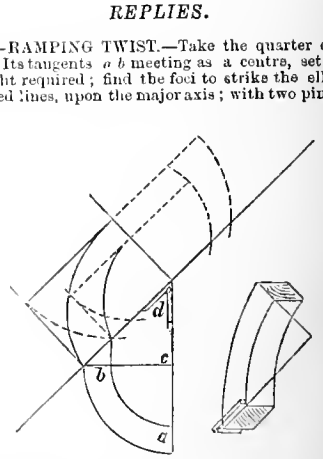
[880.]—SCARFING TIMBER.—I should like to know the best way of scarfing two half balks of timber, 12ft. by 6ft.; and also what are the advantages of the different ways of joining a rafter to a tie beam in a trussed roof. Is a bolt best, or a strap?—CARPENTER.

[881.]—FLOW OF WATER.—Could any of the contributors to "Intercommunication" inform me what is the best shape for a brick drain having about eight square feet of superficial water way; and also if it should have an invert or not, and be built in mortar or Roman cement?—C. P.

[882.]—PARALLEL RULER.—Will you allow me to ask, through the medium of your valuable "Intercommunication" columns, which is the most correct instrument to use for drawing parallel lines? I have tried the ordinary hinged ruler, but find it extremely inaccurate; and the other kind, which runs on small wheels, is not much better when worked over a large sheet of paper. I should be much obliged to anyone who would give me their own experience upon the point.—DRAUGHTSMAN.

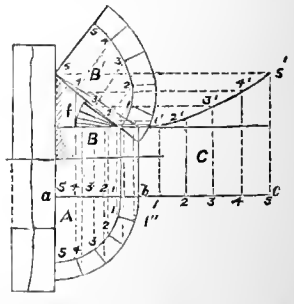
REPLIES.

[854.]—RAMPING TWIST.—Take the quarter circle as a base. Its tangents *a b* meeting as a centre, set up *c d* any height required; find the foci to strike the ellipse, as per dotted lines, upon the major axis; with two pins and a



thread complete the same. The level for its section is taken from the angle *a*, and the perspective shows its application.—M.

[854.]—In answer to "Amateur Foreman," I beg to say, taking it as a wing wall to an embankment, the top of wall would have to coincide with the slope or batter of the embankment, and which would be an oblique section of a cylinder. In the accompanying sketch, A being the plan of



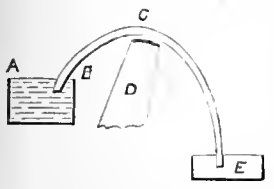
wall, B the section of embankment, divide the plan A into any convenient number of stones, and from each of the divisions draw parallel lines meeting the section line B in the points 1, 2, 3, &c., and from these points draw ordinates perpendicular to the sectional line in B', and transfer the lines 1, 1, &c., in A to 1, 1, &c., in B'; then draw the curved line through these points, which will give the curve on the top of wall. To get the development or the elevation stretched out, prolong the line *a b* in A to *c* in C, and take the distance *c* 1'' in the compass, and prick off the same number on the straight line to *c*; then from these raise perpendicular lines meeting horizontal lines drawn from the points 1, 2, 3 &c., in B and intersecting each other in the points 1', 2', 3', &c., in C, and a line drawn through these points gives your curved elevation, stretched out, and to which curve you must finish the top of your wall under the

coping. Draw the arc *f* in B, and divide it into as many parts as you have stones in the coping, and one of those divisions gives the angle or twist in the bed of each stone. —S. Lewis.

[864.]—TWISTED WALL.—If "Aspirant" will insert a plan I will endeavour to give him an easement for the same.—M.

[864.]—POLISHED GRANITE.—In reply to your correspondent "Hard Stone," I may state that the invariable method of polishing granite here is by rubbing the stone with sand and water until all tool marks have disappeared and an even surface is obtained; then rub with emery powder until quite smooth, and a dim gloss appears; lastly, with putty powder (peroxide of tin), which brings the surface to the required finish. The tools used are simply pieces of cast metal; at the last process a piece of strong felt next the stone. If he is to polish by hand labour he will require to exercise a little patience, as it is a slow process.—Aberdonian, Aberdeen.

[865.]—THEORY OF PUMPS.—Your correspondent is at fault by saying "that water cannot be raised by means of a syphon unless the level of the source of supply is higher than the top of the bend." The fact is, if the discharge end of a syphon be lower than the supply end the water will rise to a height corresponding to the amount of atmospheric pressure on the surface of supply. Thus, A B, source of supply; D, embankment; E, discharge end. I have seen water raised from a quarry bottom 30ft. right up the rock.—Aberdonian.



[865.]—The writer of the article on this subject is in error when he says that the level of the source of supply in the case of transporting water by means of a syphon, must be higher than the top of the bend of the syphon; it is only necessary that it should be above the outlet. It must be borne in mind that the short arm of a syphon must not exceed about 30ft in perpendicular height, the weight of a column of water above that being equal to the pressure of the atmosphere, which is the lifting power in a syphon.—H. Bensted, Maidstone.

[866.]—FLINT WALLS.—An authority on flint walls says that they should not, if intended for durability, be less than two feet thick. It should be built slowly and solidly, flushed up with stiff, strong mortar, compounded of quick-setting stone lime and coarse sharp sand, free from loam. As flint is a non-absorbent, brick and tiles are often worked into the middle of the walls to assist in the induration of the mortar; but for the sake of economy, lumps of hard chalk, pebbles, and flat-bedded stones are frequently used as the principal components of the core or middle of the wall. The work must be kept as dry as possible during its erection, as well as subsequently; frost is found soon to level the work while saturated with water. Flint walls are strengthend by lacing courses formed of bricks three or four courses deep, not generally showing outside. At Cambridge, Brandon, and elsewhere, they do show, and are used every two or three feet. The object is not only to get a continuous bond but to bring the work to a level bed, and again start fair. When round flints are split, and the thicker portion is kept, as usual, at the face of the wall, driving rains are easily conducted by the inclination of the upper bed of each course to the middle of the wall, and by keeping it damp conduce to its decay; but as flints are seldom split at right angles to their axis, they can be so laid in the work as to be flush on the face as well as level, and the lower bed must be firmly pinned up with fragments. It is desirable that cavities for drainage, with exit holes at the plinth level, be formed in the middle of the wall by building in rods of wood or iron vertically and drawing them up as the work progresses. The face is sometimes finished by inserting in the mortar joints gallets, or the sharp fractured bits of flint when the work is galleted or garreted.—Bookworm.

[868.]—ENTASIS OF A COLUMN.—"J. P. O." will find the best method of giving the entasis to a column by using the instrument invented by Nicomedes, and described by Blondel in his work "Resolution des quatre principaux problèms d' Architecture," and more recently by Nicholson, in his "Practical Builder," published by Kelley, Paternoster row. Vignold gives a method by lines, but "J. P. O." will find Nicholson work the best for the purpose and the quickest. As regards "J. P. O.'s" second request, there are so many works on the Five Orders of Architecture that it makes it difficult to recommend any one without knowing the purpose "J. P. O." wants it for, whether professionally or not. "Architecture Orders," by W. H. Leeds (Weale's Series), can be got for 1s.—W. R. Atkinson, Meckfield.

[868.]—"Nicholson's Five Orders of Architecture" directs:—Divide the height of column into four parts, and the difference between its diameter at base and at necking also into four parts; upon an arc describing its lower circumference square up the four latter parts to cut the former, and through the points of intersection draw a regular curve. The diminution differs with the order; and, according to some authorities, columns should commence to diminish at one-third their height, the diminution being, in some cases, one-sixth the diameter at base; in others, 8 minutes (60 minutes 1 diameter). "Leed's Five Orders," the above quoted work, Gwilt's, and "Chamber's Architecture," an anonymous work printed for J. Taylor, Architectural Library, High Holborn, and rare, seldom used, and much abused "Batty Langley," are a few of the many good works of reference upon the orders. Vitruius, Palladio, and "the Athenian Stuart," are, of course, *the* authorities.—F.

It has been decided to erect a statue to the memory of the late Mr. W. Rathbone, of Liverpool. The subscriptions to the memorial fund amount to about £3,000.

WAGES MOVEMENT.

The master masons of Crieff received an intimation last week demanding the advance of a halfpenny per hour, but they were nearly all unanimous in refusing the request. The result of the masters' refusal was that the whole of the journeymen ceased to work on Thursday week.

The Birmingham masons' labourers, taking advantage of the present masons' strike, have addressed a letter to the masters expressing their determination not to work under 4½d. per hour.

A number of the Bolton master painters have conceded the demand made some time ago by their workmen for an increase of wages, for which the men have, through the local papers, published their "hearty and sincere thanks."

BUILDING AND LAND SOCIETIES.

The directors of the Standard Investment and Building Society, Edinburgh, have issued their tenth annual report. The total receipts have reached the sum of £229,309, being an increase of £67,053 upon the previous year. The profits of the society amounted during 1867 to £9,309 17s. 5d., of which £6,447 17s. 5d. have been devoted to the payment of interest to shareholders and depositors; £764 3s. 8d. to defraying cost of management; £367 18s. 1d. for office expenses; and the balance, £1,819 18s. 11d., to the credit of the reserve fund.

LEGAL INTELLIGENCE.

Important to Contractors.—Vigers *v.* Peto.—This was an action against Sir Morton Peto by a contractor who had contracted to carry away the materials extracted in making the excavations for the Metropolitan Railway Company; and the question was as to the construction of the contract, which was that the plaintiff should be paid at the rate of 1s. 4 d. per cubic yard for the materials carted and carried away. The point was as to the meaning of the words "per cubic" yard—whether that meant the yard *in situ* (*i.e.*, as the soil lay in the earth,) or the yard, as it was measured after excavation when the materials were loose. The difference would be enormous; a matter of some thousands of pounds. At the trial, however, the plaintiff failed, the construction put upon the contract being adverse to him; evidence being adduced on the part of the defendant (which was objected to on behalf of the plaintiff, but received) to show that the phrase was understood by contractors in the sense opposite to that for which the plaintiff contended—viz., in the sense that a cubic yard means a yard of earth as it lies *in situ*. Upon this construction the plaintiff would already have been paid; on the contrary view he would be entitled to recover some thousands more. The question was whether the evidence was admissible, and whether the plaintiff's view of the contract was the right one—that the cubic yard meant the yard of earth as it lay loose after excavation. After a long argument and some deliberation, the Lord Chief Justice pronounced the judgment of the Court in favour of the defendant. Taking the words as they stood, it might be that the plaintiff's view would be right; but, taking them in the sense in which they were understood in the business, according to the finding of the jury (upon evidence the court deemed admissible), the defendant's view was the right one—that "per cubic yard" meant the earth as it stood before excavation. The other learned judges concurred. Judgment for the defendant.

The Duke of Buccleuch and the Metropolitan Board of Works.—This case was at length settled in the Court of Exchequer on Tuesday. At the late trial before the Lord Chief Baron, the jury returned a verdict for the plaintiff for the amount claimed, but the court granted a rule to enter a verdict for the defendants on a nonsuit, or for a new trial, and it was argued on Tuesday last. The Lord Chief Baron in delivering judgment said that substantially the plaintiff claimed compensation for being deprived of the causeway or jetty running down from Montagu House to low water mark in the river; and also the mansion being injuriously affected by the substitution for the river of a public roadway. The award was *prima facie* good, but if it appeared that the umpire had given compensation for anything which was not a proper matter for compensation and that he had exceeded his jurisdiction, the award would be bad, and should be set aside. He did not think it was necessary in this case to determine whether the evidence of Mr. Pollock was admissible, because it was irrelevant or immaterial, inasmuch as there was enough without it to prove that the award was good, and that the plaintiff was entitled to the full sum he had been awarded. If any person had, without the power of an act of Parliament, annihilated the causeway or jetty, and shut out the duke from immediate access to the river, his grace would have had a right of action against him, and upon the same ground he was entitled to the compensation he claimed from the defendants. He therefore thought that the plaintiff was entitled to judgment. Mr. Baron Martin, in concurring, said he was of opinion that the evidence of Mr. Pollock was admissible. With regard to the award, he added, that if the defendants had executed the works in question without an act of Parliament and the plaintiff brought an action against them, there was not a single head of damage in the present claim under which, at the trial, evidence could not have been given. Mr. Baron Bramwell, while agreeing that the plaintiff should have judgment in his favour, did not think that the umpire's evidence was inadmissible. Mr. Baron Channell also gave judgment for the plaintiff; but was of opinion that the evidence was admissible, not for the purpose of altering the terms of the award or explaining it, but with the object of destroying it, by showing that the umpire had in his calculation included something with respect to which he had no jurisdiction to award compensation. The rule was discharged accordingly.

The Prudential Insurance Company.—On Monday Mr. Coleridge applied, in the Court of Queen's Bench, for a rule on behalf of the Prudential Insurance Company, calling upon the Commissioners of Sewers to show cause why a writ of *certiorari* should not issue directing them to bring up an inquisition of the last quarter sessions of London with a view to its being quashed. The plaintiff's are the owners of freehold property to the extent of 10,884 square feet, one portion of which abutted on Ludgate-hill, and for the whole of which they had paid at different times £35,000. The Commissioners of Sewers required that part in Ludgate-hill for the improvement there going on, and having given the plaintiffs notice to treat they afterwards went before a jury at the London quarter sessions, presided over by the learned Recorder, when the jury assessed the value of the whole of the property at £34,094, being less than that actually paid for it. It was now sought to upset the verdict on three grounds, the first that the adjudication of the commissioners as provided under their private act of the premises required for the improvements was not co-extensive with the property taken. The adjudication was for the houses 57 and 59, Ludgate-hill, and the commissioners had taken in addition Nos. 2, 3, and 4, in St. Martin's court. The second point was that the act provided that the person to strike the jury to assess the damages should be specially appointed by resolution of the commissioners, but instead of so appointing, the jury had been summoned in the usual way by the clerk of the peace. The third point was the improper reception of evidence. The Court said they had no power on *certiorari* to deal with the latter point. There would be a rule on the first and second points, but not on the third point.

MEETING FOR THE ENSUING WEEK.

Fri.—Architectural Association.—A paper on "Early Brickwork," by Rev. E. L. Cutts, M.A., at 7.30.

Our Office Table.

We hear, on good authority, that Mr. Bentley is appointed, by the Archbishop of Westminster, architect to the new seminary for priests, to be erected at Hammersmith.

The council of the Society of Arts have this year awarded their Albert Gold Medal to Joseph Whitworth, "for the invention and manufacture of instruments of measurement and uniform standards, by which the production of machinery has been brought to a degree of perfection hitherto unapproached, to the advancement of arts, manufactures, and commerce." The medal was instituted to reward "distinguished merit in promoting arts, manufactures, or commerce," and among the recipients in former years have been Sir Rowland Hill, Professor Faraday, and Messrs. Cooke and Wheatstone.

At a meeting of the Metropolitan Board of Works on Friday last, the clerk read a letter from the secretary of the Metropolitan District Railway Company, stating that he was prepared to pay into the London and Westminster Bank the sum of £40,000 in the name of the Earl of Devon and Sir John Thwaites, which was one of the conditions upon which that portion of the embankment between the Temple-gardens and Blackfriars was to be proceeded with. It is intended to construct the works on a solid embankment, and advertise for fresh tenders accordingly.

The directors of the Great Britain Mutual Life Assurance Society have drawn attention to their novel system of appropriation of the profits. By their rules the bonuses may be applied, first, in extinguishing the premiums after a certain number of annual payments, and then in rendering the amount insured for payable during the assurer's lifetime. These additional advantages are offered at the usual premium. We believe this plan to be peculiar to the Great Britain Assurance Society.

On Tuesday last a public park was formally presented to the people of Paisley by Mr. Thomas Coats, of Ferguslie, who, in the formation and endowment of this place of recreation for his fellow-townsmen, has laid out no less than £20,000.

A bazaar was opened in the Leeds Townhall yesterday by the Mayor, which has for its object the liquidation of the debt—about £6,000—remaining on the new local Mechanics' Institute.

Mr. W. J. Linton, the well-known English artist, has received and accepted the appointment of general superintendent of the Cooper Institute School of Design, New York, the most important institution of the kind in the United States.

It appears that 117 drinking fountains and 99 troughs for animals have been erected, and have been kept in repair by the Metropolitan Drinking Fountain and Cattle Trough Association. But this association, like almost every good institution, is in want of funds, or it would have done a still more beneficent work. A fountain and troughs have recently been erected in Uxbridge-road. The fountain, which is made of wood, stands at one end with two large troughs attached to it, each nearly 20ft. in length, the upper one for horses and bullocks, and the lower for smaller animals, whilst a seat for weary wayfarers is placed at the back. A site for a similar erection in the Harrow road, near the cattle landing-stage of the Great Western Railway, has already been granted by the Paddington Vestry; but the society have exhausted their resources, and are obliged to wait the receipt of further contributions before they can occupy this and many other places where they are anxious to fix troughs.

Lord Cranworth's Religious Building Sites Bill, the object of which is the need of enrolling in Chancery deeds conveying the sites of chapels, mechanics' institutions, or similar institutions, has been read the second time in the House of Lords. But we fear, like the Education Bill and other bills equally useful, the Building Sites Bill will be dropped on account of the lateness of the session and the presumed pressure of work. The Lords, however, have very little to do, and that little is done somewhat lazily. The provisions and objects of this bill are so simple that they require but little discussion or consideration before they become law.

The new Streets' Act is not likely to become a dead letter. An Essex waggoner was summoned last week, before the Thames police magistrate, for obstructing the thoroughfare outside the "Plough," in Mile-end-road. Though the waggoner pleaded that he was only taking "refreshment" after working thirty hours, the magistrate fined him 2s. 6d.

The great engineering difficulty found in carrying out the work of the St. John's Wood Railway was in the stiff nature of the subsoil. Another difficulty arose in passing over the Regent's Canal, where the line has to rise at a gradient of 1 in 60. This, however, was a trifling work compared to taking all the sewage under the canal at such a level that it was always within a yard of the water over it. The work was accomplished by driving iron cylinders beneath the canal; and though sometimes within less than 3ft. of where the keels of the barges passed over them, there was no leakage or delay of any kind.

On Tuesday a deputation, composed of representatives of various local bodies of the metropolis, waited on the Duke of Marlborough, to urge their objections against the Artisans' and Labourers' Dwellings' Bill, which has been referred to a select committee of the House of Lords. The Duke of Marlborough said that the measure would probably be referred to a select committee, when he did not doubt that all that was good in it would be retained, and an opportunity would be given to the members of the deputation to show cause against those parts which, in their opinion, were useless or impracticable.

The foundation stone of Her Majesty's Theatre has been exhumed. Upon its being raised, in a cavity in the bed of the stone were found a guinea, date 1788; half-guinea, date 1789; a shilling, date 1787; a sixpence, date 1787; a fourpenny-piece, date 1786; a threepenny-piece, date 1772; a twopenny-piece, date 1786; and a silver penny-piece, date 1786. The position of the stone was in the north wall of the box corridor, on the centre line of the auditorium, under the opening leading from the hall to the pit corridor, at a depth of 2ft. 3in. below the paving of the hall. The dimensions of the stone are 2ft. 1in. long, 1ft. 1¾in. wide, and 1ft. deep. The inscriptions on the stone are as follows:—On the top, "The first stone of this new theatre was laid on the 3rd of April, 1790, in the 30th year of the reign of King George III, by the Right Hon. John Hobart, Earl of Buckingham—*Auctor pretiosa facit.*" On the front—"The King's Theatre, in the Haymarket, first built in 1703." At right end—"But unfortunately destroyed by fire on the 17th of June, 1789." On the back—"*Prevalebit justitia.*"

A bold proposal has been made to carry the Thames Embankment as far as on an even line with the southern entrance of St. Paul's Cathedral, and thence to cut a wide street from the river to St. Paul's-churchyard. We fear it is not very likely to be carried out.

The Metropolitan Board of Works have made arrangements for the paving of the portion of the Thames Embankment between Westminster Bridge and the Temple, adapted for foot passengers, and the promenade, it is thought, will be thrown open to the public in about a month from the present time.

At a recent meeting of the St. George's Committee of Works, a letter was read from Mr. Cundy, 34, Grosvenor-square, asking the vestry to widen the approach from Buckingham Palace to Victoria Station, at the expense of the parish. The clerk, Mr. Smith, said that a similar application had been made by the railway company, and an answer was returned giving consent provided it were done at the expense of the railway authorities. To this no answer had been received. The same course was adopted on the present occasion.

Mr. Francis Horner has been elected president of the Liverpool Architectural and Archæological Society, and not Mr. H. P. Horner, as stated in our last number. Mr. Francis Horner is an amateur who has been many years a member of the society, and who has taken so much interest in architectural and artistic subjects, and read so many valuable papers before the society, that they felt justified in departing in this case from their usual rule of electing a professional member to the chair.

Trade News.

TENDERS.

Lamp-posts.—The Mile-end Old Town Vestry, in answer to advertisement for the supply of 50 lamp posts, received seven tenders, ranging from £85 13s. 4d. to £144. The lowest tender, which was that of Mr. E. J. Hall, was accepted.

Brighton.—For building a Wesleyan Chapel, Brighton, for the Rev. P. Hoskins. Quantities supplied:—

		Stone spire.	Wood spire.
Regis	£5250	£ 350	—
Cheesman and Co., Brighton (inclusive)	—	4750	£4600
Holloway and Son	4447	203	170
Nightingale, London	4444	245	190
Dean and Dickenson, Brighton	4400	280	195
Saunders, London	4375	—	—
Gresswill Forest Hill	4308	263	183
Sawyer, Dulwich	4353	250	175
Anscrombe and Co., Brighton	4120	202	132
Chappell, Steyning	3944	204	156

Cambridge.—For a villa at Menea, Cambridge, for Mr. Tears. Mr. Winder, architect. Quantities supplied by Messrs Lansdowne and Co.:—

	House.	Verandah.	Total.
Gibbens, Bundingford	£1500	£65	£1565
Eaton and Co., London	1395	60	1446
Bell and Son, Cambridge	1386	60	1446
Luke Grimston, Royston	1289	50	1340
Nightingale, London	1253	60	1313

Horncastle.—For enlarging the Wesleyan Chapel:—

Thomson, Louth	£3933 7 0
Clarke, Louth	3892 10 0
Walter, Horncastle	3797 8 0
Hobson, Hogsthorpe	3587 0 0
Brown, Hatchff, and Pinchbeck	3250 11 8
Bellamy and Jay, Horncastle	3148 8 8

Kingston.—For building new house, Market-place, Kingston. Messrs. Walker and Elsam, architects. Quantities supplied:—

Goulter Kingston	£1518
Wells, Kingston	1467
Walker, Kingston	1465
Towyel, Surbiton	1394
Nightingale, London	1353
Mason, Kingston	1329

Liverpool.—For Church of St. Nathaniel, Windsor, Liverpool. David Walker, architect:—

Harrison	£4436 18 0
Westmorland	4398 0 0
Wenson	4389 10 0
Roberts and Robinson	4371 10 0
Hughes	4072 0 0
Chuck	4052 0 0
Borroughs and Son	3932 10 0
Henshaw	3929 10 0
Callie	3772 5 0
Black	3708 10 0
Murphy (accepted)	3649 10 0

London.—For the construction of sewers and temporary roadways on an estate adjoining Portobello-road, Notting Hill, belonging to the Land and House Investment Society (Limited). Mr. Josiah Houle, surveyor:—

W. Williams	£3520 0 0
Thirst	3154 0 0
Wainwright	3150 0 0
Crockett	3000 0 0
Burgess	2 90 0 0
P. Porter	2960 0 0
Harrison	2950 0 0
Lean	2850 0 0
J. and S. Williams	2800 0 0
Goodair	2778 0 0
Bloomfield	2737 0 0
Faulkner and Cowley	2710 0 0
Moxon	2478 0 0
Floyd	2450 0 0
J. Porter	2390 0 0
Tinsley	2364 1 0
Nicholson	2350 0 0

London.—For painting and carpenter's work at the Mile End Old Town Workhouse. Mr. Wm. Dobson, Mile End-road, architect. Quantities not supplied:—

	Carpenters' work.	Painting.
Kelloway, Islington	£84 12 ...	£476 12
Wallis, Gordon, and Co., London Wall	—	322 0
J. Patten, Holborn	—	250 0
King, Holloway-road	35 0 ...	241 0
J. H. Leverton, High-street, Poplar	15 7 ...	206 13
Prescott, Commercial road	—	204 0
Hemby and Mann, Hackney-road	38 0 ...	195 0
Norris, Whitechapel	25 0 ...	175 0
Derby, Whitehouse-street	21 0 ...	170 0
Britton, Trevor-square	—	140 0
Brown, Ratcliffe (accepted)	10 15 ...	134 10
Minty, Southwark	70 0 ...	97 0

N.B.—In estimating, the builders had to rely entirely on their own judgment as to what carpenter's work was necessary, and what quantity of new eaves guttering was required, which item was included in the specification of painting. Hence the difference.

London.—For erecting a Congregational Church in the Brixton road. Mr. J. Phelps, architect:—

Rider	£11,670
Little	11,599
Downes	11,560
Webb and Sons	11,466
Nicholson	11,446
Browne and Robinson	11,150
Simpson	10,990
Gammon	10,917
Jackson and Shaw	10,950
Patman and Co.	10,8 6
Adamson	10 850
Brass	10,849
Higgs	10,565
Myers	10,242

London.—For warehouse and stabling, Cross-street, Finsbury. Mr. H. J. Hammond, architect:—

Ennor	£3453
Turner and Sons	3411
Macey	3394
Bishop	3392
Eaton and Chapman	3166
Henshaw	3089

London.—For erecting three houses at Upper Clapton, for Mr. Jacomb. Mr. Cheston, architect:—

Wood	£4502
Ashby	4409
Rivett	4406
Lewis	4124
Myers	4097
Ennor	3837
Webb and Sons	3748

Longton.—For bank for Lloyd's Banking Company, Longton, Staffordshire. J. Burrell, architect:—

Inskeep, Longton	2775
Espley, Stafford	2696
Smith, Tean	2395
Barlow, Stoke (accepted)	2364

NORWOOD.—For building pair of villas for James Cann, Esq., at Norwood. Mr. J. Thomas, architect. Quantities supplied:—

Taylor	£1713
Thompson	1560
Colls and Son	1451
Nightingale	1423
Wells	1387
Bryan	1384
Ring	1358
Best	1313

RIVER (KENT).—For dwelling house, for Mr. Alfred Kingsford. Mr. Rowland Rees, jun., architect:—

Fagg	£2 83
Adcock	2150
Tunbridge	1965

PROPERTY SALES.

MAY 15.

AT THE MART.—By Mr. James Beal.—Leasehold residence, No. 838, Old Kent road, annual value £60, term 14 years unexpired, at £10 per annum—sold for £200.

Leasehold business premises, No. 8, King street, Covent-garden, let on lease at £120 per annum, term 61 years from 1831, at £28 per annum—£1,110.

By Mr. Robert Reid.—Leasehold residence, No. 8, Delahay-street, Westminster, annual value £367 10s. per annum, term 16 years unexpired, at £100 per annum—£1050.

Leasehold residence, No. 51, Tavistock-square, let on lease at £125 per annum, term 52 years unexpired, at £24 per annum—sold for £1,190.

Leasehold residence, with stabling in the rear, No. 45, Marine Parade, Brighton, let on lease at £200 per annum, term 20½ years unexpired, at £15 per annum—£1,350.

MAY 18.

By Mr. H. O. Martin.—Freehold plot of building land, situate at Upper Teddington—£30.

A freehold plot of building land situate at Upper Teddington—£33.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

George Newton, Albert-terrace, Notting hill, builder, June 11, at 11.—William Grey Rea, Burlington-road, Bayswater, builder, June 22, at 12—William Turner, Bromley, Middlesex, carpenter, June 12, at 12—Henry Bagge, Rose-cottages, Speldhurst road, South Hackney, builder, June 15, at 2—H. J. Barnes, Little Chester-street, Belgrave-square, builder, June 11, at 1—James Eve, Maidstone, builder, June 11, at 11—William Robertson M'Cree, late of Guildford-street-east, Clerkenwell, house decorator, June 17, at 12—C. Norwood, Twemlow terrace, London-fields, house decorator, June 8, at 1—J. Raby, late of East Ham, Essex, building contractor, June 17, at 12—G. H. Read, Victoria-place, Old Kent-road, jobbing builder, June 11, at 1.

TO SURRENDER IN THE COUNTRY.

George Gregg, Dalton-in-Furness, builder, June 2nd, Manchester—Alfred Ormerod, Heaton Norris, joiner, June 12, Stockport—Joseph Fenwick Davison, joiner, June 12, Sunderland—Thomas Thompson Laverick, joiner, June 9, at 12, Sunderland—Henry Newton, joiner, June 16, at 11, Chesterfield.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

June 19, T. Atkinson, Northallerton, builder—June 9, W. Burtinshaw, late of Preston, joiner—June 16, J. Gore, jun., Herne Bay, Kent, contractor—June 9, W. H. Wills, Stapehill, Hampreston, Dorset, bricklayer—June 23, H. Katcliffe, Birkenhead, painter—June 18, W. Bull and R. Jeffery, Tunbridge Wells, builders—June 24, J. Scott, Birmingham, architect—June 23, J. Cotes, Derby, painter and paper hanger—June 25, R. T. Hunter, Sunderland, builder.

PARTNERSHIPS DISSOLVED.

Ormandy and Lowther, Barrow-in-Furness, joiners and builders—F. and J. Cosser, York road, and Westminster-bridge-road, builders.

DIVIDENDS.

W. Rubardt, Duke street, Grosvenor square, painter.

DECLARATION OF DIVIDEND.

J. D. Williams, Chester, builder, div. 4s. 4½d.

SCOTCH SEQUESTRATION.

Kennedy and Russell, Edinburgh, builders, May 27, at 2.

THE MUSEUM OF BUILDING APPLIANCES,
(ARCHITECTURAL SOCIETIES' HOUSE, 9, CONDUIT STREET),
23, MADDOX STREET, HANOVER SQUARE, LONDON, W.,

In Connection with the ARCHITECTURAL EXHIBITION, has been established in this the central home of the various Architectural Societies of England.
OPEN DAILY THROUGHOUT THE YEAR. ADMITTANCE FREE.

The design of the Proprietor is to collect reliable information regarding all Building Appliances, and especially New Inventions and Improvements, and to communicate the same *gratuitously* to *Architects* and others interested in Building.
Prospectuses, with Terms for the Exhibition of Drawings, Address Pinnacle, Models and Specimens, may be obtained of the Curator at the Museum.

NAMES OF EXHIBITORS. (SEASON 1868.)	WORKS REPRESENTED.
Arrowsmith, A. J., and Co.	Solid Parquet Floors—Bent Wood Furniture.
Atkins, F. and Son	Moulded Carbon Filters.
Ayling, Stephen	Architectural Photography.
Baker, Rev. H. S.	Eagle Lectern in Carved Oak.
Beale, Montague, and Co.	Gas and Hydraulic Works.
Black, John	Wood Carving.
Blashfield, J. M.	Terra Cotta and Architectural Pottery.
Blundell, W.	"Bilance Cone," Air and Smoke Escape.
Borey, J.	Varieties of Devonshire Marbles.
Boyd, D. O.	Patent System of Ventilation.
Braby, F., and Co.	Zinc Roofing, Corrugated Galvanised Iron and Mouldings.
Broomhall Tile Company	"Taylor's" Patent Roofing Tiles and Damp-proof Course
BUILDING NEWS	Architectural Journal.
Bullivant, T.	Patent Airtight Noiseless Sliding Sash.
Burt and Potts	Wrought Iron Watertight Casements.
Chatwood and Co.	Patent Safes and Locks.
Coalbrookdale Company	Ridge and Roofing Tiles, Crestings.
Cooper, J. K.	Roofing Tiles, Ridge Crestings.
Copeland, W. T. and Sons	Porcelain and Stoneware Slabs and Tiles.
Cormell, J.	Art Metal Works.
Coulton, J. L.	Stained Glass Works and Decorations.
Curtiss, W.	General Building Works
Ceramic Art Union	Ceramic Statuary, Vases, &c.
Davies, C. H., and Co.	Genuine Solid Parquet Floors.
Derbyshire	Fossil and other Marbles.
Dugert and Bolfe	Asphalted Roofing Felt.
Farnworth, J. H.	Patent Self-lifting and Self-fastening Sash.
Fox, Robert	Patent Fastenings, Zinc Roofs, Sashes, &c.
Grace, C., and Co.	Green Roofing Slates, Gane's Eureka Tint.
Hobbons and White	Patent Mortise Furniture, Iron Casements.
Lever G., and Co.	Improved Dry Gas Meters.
Godwin, W.	Encaustic Tiles, Tesselated Pavements.
Hall, W.	Oxide of Iron Paint.
Hart, J., and Son	Art Metal Works and Brasses.
Haward, J.	Wall Decorations.
Hogg, W. S.	Fireproof Doors and Columns.
Johnson, C.	Patent Building Hoists.
Jones, J., and Sons	Hot Water Apparatus, Boilers, &c.
Lee, W. and J.	Patent Double action Mortise Bolts and Locks.
Letheren and Bundle	Art Metal Works.
Lizard Serpentine Company	Cornish Serpentine Marble.
Lloyd and Summerfield	Crystal Sash Bars and Aquariums.
Lowther and Co.	Patent Sun Blind, "Helio-Scene."
Macnaught, Robertson and Co.	Rolled Iron Girders and Joists.
Malkin and Co.	Encaustic Tiles and Mosaics.
Matthews, E.	Monumental Brasses.
Medwell and Son	Clipsham Down Building Stone.
Merryweather and Sons	Fire Engines, Hydrants, Fire Apparatus.
Minton and Co.	Encaustic and other Tiles and Mosaics.
Morris and Field	Sanitary Appliances, Baths, Lavatories, &c.
Moseley and Hooker	Electric Bells and other Apparatus.
Moule	The Patent Earth Closets.
Norris and Son	Moulded Bricks, Ridge Tiles, &c.
North Devon Pottery Company	Stoneware Closet and Apparatus.
Farrant Strong	Patented Cellular Construction Hexagon Hollow Tubes.
Potter and Son	General Building Works.
Ridgway and Bellenche	Encaustic and other Tiles.
Rosher, F. and G.	Bricks, Tiles, Portland Cement.
Sax, J.	Electric Bells and Indicators.
Scammell and Co.	Door Furniture, Finger Plates.
Shand and Mason	Fire Engines, Hose, Hydrants, &c.
Sidebotham, Banks, and Co.	Patent School Desks and Seats.
Smith, A. and Co.	Patent Double action Door Springs.
Smith and Turner	Patent Door Springs.
Standing and Marten	"Cracke's" Patent Capped Drain Pipes.
Tingey, W., and Son	Portland Cement.
Tuttenham and Co.	Patent Improved Twisted Iron.
Tyler, J. W., and Co.	Zinc Roofs, Dormers, Mouldings, &c.
Walford and Donkin	Fret Carved Chairs.
Warren, G.	Scagliola for Architectural Purposes.
Water Purifying Company	Patent Syphon Cistern Filters.
Watson, Charles	Double Current Syphon Ventilators.
Wheeler Brothers	Moulded and Pressed Bricks.
Whieldon, Lecky, and Lucas	Spherical Hinges, Gate and Door Fittings.

This List will be rapidly added to, and it is believed that the Museum of Building Appliances is capable of almost indefinite extension. Exhibitors will be urged to record the fullest information, and no trouble will be spared to procure for architects, *gratuitously*, any further information which may not already be recorded upon the books of the Museum. Architects and their clients are solicited to choose from the Specimen Works exhibited, and orders will be received for transmission to the exhibitors if desired. All applications to be made to the Curator.

THE MUSEUM OF BUILDING APPLIANCES,
23, MADDOX STREET, HANOVER SQUARE, LONDON, W.

THE BUILDING NEWS.

LONDON, FRIDAY, JUNE 5, 1868.

NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.

SECOND NOTICE.

EARLY ITALIAN PAINTING.

NOT many years ago such a heading as that to which we append this article would at once have condemned it. Everything previous to the age of Raffaelle was then deemed unworthy the attention of art lovers, and the general belief was that previous to the advent of this artist the "Dark Ages" literally existed. Thanks to the labours of Roscoe in translating Lanzi, and still more thanks to the Arundale Society for transmonstrating the works Lanzi wrote of, that peculiar corporate body "the British public" had learned that there were men before Agamemnon. In painting, as in all else, the world is finding out that, though one link in a chain may shine brighter than another, it is but an useless bit of metal without its fellows. Of the many links exhibited at Leeds, we propose to examine those few which lead us through the fifteenth century, for unhappily we have but little of an earlier epoch. Of the first issuing of the art of painting from the darkness into which the overthrow of the Roman empire had plunged it, we have nothing here. Such works that remain to us exist chiefly in mosaic, and must be studied *in situ*. The next links are fastened to crumbling walls in fresco, and those which emerged into the sunrise glow of the fourteenth century are scattered so wide, and are now valued so much, that it has been found impossible to reunite them here. We regret this greatly, for nothing gives so great a value to any brain labour as the evidence of that which has resulted from it. We wish that we could see how, through the labours of the Greek artists of Byzantium, the mind of Italy was tilled, and note the succeeding crops which rose, flourished, and seeded until the time of Orcagua; for the works of this great man form the initial period of the present exhibition. Of him we have but one small example, an octagonal panel, from one of his many retables representing the Coronation of the Blessed Virgin, a pure and fine piece of colour and composition, noteworthy for the clever manner in which the heavy mass of colour in our Lord's robe is balanced by its repetition in the wings of the cherubim, forming the aureole, and for the great elevation and dignity given to the principal subject by lining the background with rayonnating lines of glory emanating from a cherub's head placed low down in the picture. The accessories and details of this small panel will repay attention, the patterns embroidered on the vestments being of great beauty. Next in point of time comes a drawing purporting to be by that early master of the Venetian school, Gentile de Fabriano. Like many another unfortunate monument of early art this has suffered severely at the hands of the restorers, and though, as an useful illustration of the *technica* in painting, it is valueless from this cause, yet it still retains sufficient of its original intention to be useful as a study of the colour and composition of the fourteenth century. It is a large retable of three divisions, the central containing the figure of a saint seated, giving his benediction with his right hand, and holding a pastoral staff in his left. Very large use is made of gold in the drapery, so much, indeed, that it seems as though the gold had left the backgrounds and taken to the figure; for, contrary to the usual works of this epoch, the background is not gilt. The head is finely painted, and the broad folds of the drapery well and skilfully cast. On the right wing are figures of St. John the Baptist and St. Katharine of Alexandria, and on the left St. Paul and St. Justina of Padua. The ornament on the drapery of the principal figure is well drawn and worthy of study, though some of it is of later date than the heads and other parts of the picture.

By Fra Angelico are three pictures here, and strange to say they all appear to be genuine. The first of these is a "Death of St. Francis," a small tempera picture representing the interior of the courtyard of a monastery, where stretched on a bier lies the body of the saint, and crowding round it are the weeping brethren over whom he had so lately ruled. The sick, the halt, lame, and blind are here, all come to do honour to him they so much loved; even the doubting disciple is here too, and plunges his hand, like Thomas of old, into the wounds of the *Stigmata* to receive through his senses that evidence his reason refused. In the midst of all their grief and sorrow, the last solemn litany is chanted, and far off in the deep blue sky, which shines over the convent wall, is seen the soul of the saint borne up by angels to the home of his hope. Another specimen of Fra Angelico given here is a compounded picture, the central portion being a composition by itself of the Virgin and Child, and is below the average excellence of this great painter. To this are added the wings of what must once have been a very fine triptych of the Last Judgment, representing the rising of the blessed, and the fall of the damned. The former clad in white and crowned with flowers rise like a bird from its nest to greet the morning Sun, and marshalled and welcomed by angels of many a hue, they take their flight to heaven. On the opposite side descend the damned: down headlong they fall, yet not without that sign of "Heaven's first law" which reigns everywhere, except in Michael Angelo. Rank after rank they fall, like swathes from the mower's scythe, to where indefinite forms of demons await them. There is a world of poetry in these two small bits, but to thoroughly enter into Angelico's work we must go into the Dudley Gallery and take our stand before No. 2,910. This is a marvellous Madonna and Child. Our Lord stands on his mother's right knee, leaning against her breast, and watching her mouth with infantile instinct, and with that look of an intelligence of unseen things we often see reflected from childhood's face; whilst she, conscious of His origin and destiny, watches him with the feelings of a mother and a worshipper. The Blessed Virgin is draped in a deep blue robe, and behind her angels hold up a dossal of black and gold, a very marvel of powerful colour, and at her feet sits an angel playing upon a harp, to which a young saint sings, beating time with the palm branch of her martyrdom. All is love and purity, and in looking on it we learn how Giovanni da Fiesole became Fra Angelico, and why his name bears the prefix of "Il Beato." By Gentile Bellini there is an exceedingly interesting portrait of Mahommet the Second, who, seeing some of his paintings in the hands of Venetian merchants visiting Constantinople, and regardless alike of the law and the Prophet, sent to the senate of Venice for permission to invite Gentile to his court. Whilst there this artist painted the portraits of the Sultan and Sultana, and afterwards returned loaded with honours and this painting to Venice. How it came into Mr. Layard's hands would be a history interesting to learn, as we should naturally expect to find such a picture amongst the prized possessions of the state of Venice. To Gentile rather than his brother Giovanni (to whom both these pictures are attributed in the catalogue) should we assign a "Portrait of a Man" (71), belonging to Mr. Gladstone. It is evidently some old Venetian architect who holds in one hand a grand old pair of compasses as with the other, half raised, he expounds his views to his client. Of Giovanni there are some fine examples, and one on *canvas* signed with his name and painted in a manner which, if his, must be a very early specimen, before his touch and taste were formed. If this could be authenticated it would be a remarkably early illustration of the use of canvas for painting on, but we confess to very great suspicion as to the genuineness of the signature, despite the fact that it comes from South Kensington, and, notwithstanding the faith we feel in Cole, C.B., we should say that this is a forgery. By Andrea Mantegna are two exquisite little panels executed simply in monochrome, showing the great influence the classic predilections of his master Squarcione had upon him. One of these might be, and perhaps is, a study from a statue of the finest period of Grecian art, for Squarcione so loved ancient art that he himself made many voyages to Greece to collect for himself, and any Venetian trader who brought home such things found a ready purchaser in the Mantuan artist. By Benvennto di Senese we have a fine but somewhat damaged retable, arranged as a triptych. The centre consists of a large panel showing the Blessed Virgin seated on a throne of white marble, ornamented with inlay, having on it a crimson and gold cushion. Our Lady is arrayed in a marvellously rich crimson vestment powdered with gold embroidery, having over all a deep blue robe lined with dull olive green—a charming harmonic in colour, which, with the white coiffed headdress and dark pedecloth bearing the initials of the angelic salutation, make up a charming picture. The face of the Virgin is finely drawn, much better than that of the Divine infant, who is clad in a short purple tunic, and seated on the right knee of His mother, who presents a bunch of white roses to Him. On the back of the throne stand two angels, the one vested in white, playing a mandolin; and the other, robed in crimson, playing the viol. The valve to the triptych, on the right of the Madonna, contains a large figure of St. Peter, represented with the typical short face, bald head, and white beard, which have been traditionally handed down to us by artists from the earliest ages of Christian art. His right hand grasps the mystic keys of gold and silver, and his left is closed upon his book. His vestment is of crimson and gold, and his robe of yellow lined with green. On the opposite side is a figure of St. Nicholas, of Bari, vested as a bishop in a gold embroidered cope, having its orphreys filled with figures of saints, and bearing on his left arm the pastoral staff. This large picture is quite worthy of much professional study. The details of the ornament are charming, and the general effect is decorative in the extreme, whilst the painting of the hands and flesh generally is, for the date, very excellent; and though there is much which detracts from its merit as a fourteenth century work in the repainting it has undergone, yet as a study in the colour and composition of the time, it is very valuable.

Some very interesting cassone fronts are the only things attributed to Pinturicchio, and as works of art these are poor. In one of them, interesting from an archæological point of view as exhibiting the laying out of a table for a feast then-a-days, the napkins, manchets of bread (which served for plates), knifes, and *forks*, are all carefully represented, and an attendant brings in what appears to be a very large dish of oysters. The cassone was painted for some of Pinturicchio's great patrons, the Piccolomini family, and represents a scene from their history. Three other of these bridal chest-fronts form a series detailing the history of Patient Griselda, who by her beauty won for herself the position of a princess from that of a peasant, and from her patience and forbearance to her husband became a name in story—a very proper and pertinent moral to preach to a young bride,

and we sincerely hope it agreed with her. Sandro Botticelli is represented by a revolving panel, having on one side a portrait of a female, whose face seems to have haunted his every work, and on the reverse a typic figure of Ambition standing on a sharp and pointed mountain top, where there is no rest for the sole of her foot, and grasping the spire in her hand. From him also comes a quaint mystery, full of much poetry and feeling. It is a Nativity, or rather an Adoration of the infant Saviour. His mother and St. Joseph kneel before Him, and angels bring the Wise Men from the East and the unlettered shepherds from the hills which stand about Jerusalem to do Him homage. On the roof three angels sing of peace and good will on earth, whilst the "Gloria in Excelsis" is caught up by a heavenly choir, who in an unbroken circle hymn that strain which henceforth was without end. His pupil, Ghirlandaio, is introduced to us by a picture which has a history. It is a study for some of his frescoes in the choir of Sta. Maria Novella at Florence, where he painted a series of pictures representing the life of its patron saint, St. John Baptist. Orcagna first decorated it, but his frescoes failed, and the Ricci, who had the keeping of the chapel in their honour, like many a good old family before and since, became poor. Meanwhile the Tornabuoni became rich and solicited the honour—or perhaps we should say, the notoriety—of redecorating the chapel, stipulating, however, to retain in the post of honour the arms of the old Ricci. To the letter they kept their word, and of course in spirit they broke it, for on the pilasters were carved in profusion the arms of the new family, and the principal figures in the frescoes (as was the custom of the day) bore the likeness of its chief members, and on a little escutcheon, in the post of honour truly, for it was on the door of the tabernacle of the holy sacrament, appeared the arms of the decayed nobles. Of course the poor artist was cheated: they did him out of two hundred ducats, but, like a noble man, he preferred honour to gold, and expressed himself satisfied with a large mead of praise. Of Pietro Perugino we have several beautiful examples from Lord Dudley's collection, chiefly small pictures, but of great merit; and by Fungai is the finest specimen of him we have ever seen: it is a glorious and very unusual bit of colour. The Blessed Virgin is seated bearing our infant Lord, and is clad in a stone-coloured robe, lined with black, embroidered with gold; her vestment is of gold and crimson. The drawing is particularly good, and in the landscape behind her are seen the events of the Nativity and the coming of the Wise Men, whilst the spirit of darkness and evil hurries away at this rising of the Sun of Righteousness.

By the Crivelli are many specimens of great architectonic character. The chiefest, by Vittorio, is a large retable of six compartments, of two stages of three divisions. In the centre of the lower one is seated the Blessed Virgin and Our Lord. She is clad in a white robe, having an admirably designed blue and gold ornament upon it. The faces, like all those of this painter's work, have a painful expression. The panel to the right is occupied by the figure of an archbishop, and that to the left by St. Anthony of Padua, who is accompanied by his pig. Above them is a grand three-quarter figure of St. Peter, wearing the triple crown and bearing his symbolic keys, and a similar sized figure of St. Jerome, whilst the central compartment of the upper range is occupied by a smaller panel bearing the finest portion of the whole. It is a young figure, probably St. Lawrence, not as the others on a gold ground, but on one of a richly diapered blue, and evidently belongs to the same work as another figure here (No. 31) of a bishop, which is similarly treated. Both these are fine works of a master who was of strongly conservative tendencies, and who, whilst exhibiting the grand colouring of the Venetian school of the end of the fifteenth century, adhered to the mannerism of tempera painting when the newer mode of working in oil, which had been recently introduced by Antinello da Messina, was making head in Italy. These works which we have noticed above belong to the time and feeling when painting believed it to be her highest mission to aid architecture and to sing the refrain of that melody and rhythm she led, and when the architect, the painter, and the sculptor were, if not the same man, of the same mind, and the success of each was to the glory of all. They are therefore particularly interesting to our readers, and well worthy of their study. Next week we shall notice the easel pictures of the old masters, pictures great and glorious, but which by their very success led good men astray, and broke that triple cord which should have bound the arts in one.

MONSIEUR LAMEIRE'S DRAWINGS AT THE ARCHITECTURAL EXHIBITION.

First Notice.

We all know that the Architectural Exhibition can hardly be called a cheerful institution, if by cheerfulness is meant the companionship of our fellow mortals. Anybody who visits it during the daytime will seldom find more than two or three visitors besides himself. But yet the exhibition has generally much that is deserving inspection, if not careful study; and this year particularly so, for there are two great and additional attractions, besides the usual one of the studies of the Architectural Association. These additional attractions are the drawings of the late Sir Charles Barry and those of M. Lameire.

Of Sir C. Barry's drawings it is not my intention to make any remarks, beyond pointing out that in juxtaposition with them we have an undoubted drawing of the late Mr. Welby Pugin. We have heard so much lately of this gentleman, to whom we have all obligations, that we naturally look at the drawing with a great deal of curiosity. Strange to say, there is nothing particular about it, either in the design or in the execution. The valance is exceedingly ugly, and resembles more the work of the sixteenth or seventeenth century than that of the fifteenth, and the animals are by no means particularly well drawn. One of them, an unicorn, rivets the attention as being a most extraordinary version of that fabulous animal, and fairly divides the honour of being the most comic thing in the room with the dog in Mr. Seddon's sketch of a font at Bingen (No. 124). The designs of M. Lameire, on the contrary, are most beautifully composed and drawn. Indeed, it has hardly ever been my lot to see others which deserved more, if so much, careful consideration. It is true, as another writer has observed in the Building News, that the colour is by no means so good as it might have been. Doubtless Gabriel Rosetti would have done it better, but then men like Gabriel Rosetti are very scarce, and we must even put up with what we can get, and it is very seldom that we ever get anything one quarter as good as M. Lameire presents us with.

The history of the affair is this. Among the designs sent to the architectural section of the Great Paris Exhibition of 1867 was a series of nine drawings, representing the coloured decoration of a church. The design and the drawing were so beautiful that it is said the jury were about to give the author a grand medal. When, however, it appeared that he was no architect, but simply the chief *employé* of the great decorators, Denuelle, as it was found impossible to give him the grand medal, it was replaced by a gold one. Medals always seem a very unsatisfactory reward of merit; in our country at all events they are seldom worn as personal ornaments; they are also perfectly useless and not unfrequently utterly bad, if regarded as objects of art. Therefore, it does not particularly matter whether M. Lameire got a gold or a grand medal; all that concerns us is to know that the drawings took all his leisure time for two years, that they are in an entirely different style to that practised by M. Denuelle, that they were the most attractive designs in the architectural department of the Paris Exhibition, and that by the good offices of Mr. Spiers we have been enabled to secure them for our own Architectural Exhibition.

The design consists of the interior of a church designed in no particular style; some parts resemble Byzantine architecture, some that of the twelfth century, and others are almost Pagan. The sculptured ornament is often very bad, *e.g.*, the altar rail, which resembles what we should expect to find in the city in some of the warehouses where the "architect and surveyor" has had too much money to spend. The porch is also a very indifferent composition when we divest it of the beautiful figures on the top. The plan of the imaginary church consists of an aisled nave of five bays, a central bay, transepts of one bay each, and a choir of one bay and apse beyond. There is also a porch and aisle to choir; but this latter is blocked up by the stalls, and becomes a mere passage. No exterior elevations are given, but from the perspective drawings of the porch we learn that the exterior is ashlared, with white stone or marble, in regular courses, having sundry black bands at intervals. The aisles are lighted with bull's-eye windows filled with grisaille glass, and the interior walls are encrusted with marble. The composition of the bays is a round-headed arcade surmounted by a double triforium, or, rather, a triforium divided horizontally into two parts; the lower is pierced by a series of openings terminating in what we should call the shoulder arch, or rather, of two brackets nearly meeting. The upper part is quite solid, and affords place for a painted frieze, which forms the principal feature of the design. The building is terminated by a waggon-headed vault, divided as to the bays by means of large ribs, which are supported by pillars rising from the ground. Each bay comprises two of the arcades. The clerestory windows break through the vaulting. In the centre compartment we have a quadripartite groin at a higher level than the rest of the vaulting: underneath it is placed the altar. The apse, of course, is covered with a half dome, and the triforium becomes one composition of round-headed arches, *i.e.*, the great frieze extends only round the nave and transepts. If we look at the details we shall find that M. Lameire has carefully eschewed both mouldings and sculpture. Thus, the only sculptured caps are those of the pillars supporting the great ribs dividing the bays. The other caps are simply square masses, the circle of the column easing itself off into the square by means of a hollow moulding; but then all these masses are covered by painted ornament, and thus, probably, a better effect is produced than if the caps had been sculptured and painted, for in painting plain broad surfaces are required, as in painted furniture, where we see few or no mouldings, compared with furniture where the wood is unpainted, and where mouldings become the only decoration. The wooden stalls and entrance lobby are very poor—indeed, the worst part of the work.

So much for the building. Now let us see how the artist decorates it, and makes it tell a story. He has taken his subject from the Revelations. The centre of the apse is occupied by our Lord, not as described in the first chapter of the Revelations, but as depicted in the nineteenth, where St. John tells us that the heavens were opened, and he beheld a white horse, and he that sat thereon was clothed in a garment spotted with blood, and that he had many crowns on his head, that a sharp sword proceeded from his mouth, and that he was

followed by the armies of heaven clothed in white linen and upon white horses. M. Lameire has, therefore, placed our Lord in a circle in the middle of the vault of the apse; in a semicircle below his feet is the dragon; on either side of him, and in two lines, one above another, are the armies of heaven; below the whole, and just above the triforium, are certain circles, each containing a hand, which is pouring out the vials of wrath.

In the apse bay, which contains the altar, the waggon-headed vault is very happily treated. A great red cross divides it into four parts. Each part contains an apostle, surrounded by foliage, which springs from the cross. The cross itself is composed of a series of circles, each enclosing a lamb, while a water brook runs down between them, and flows out at the feet of the cross, whence deer come to quench their thirst. In the tympanum of an arch at the side of this bay we see an angel "treading on the lion and the dragon." This expression is generally applied to our Lord, as we see in the portals of several cathedrals. A cruciferous nimbus should, therefore, have been employed here.

The centre bay, whence diverge the nave, transepts, and choir, is much higher than the others, and has, moreover, quadripartite ribbed vaulting. In the centre or keystone is the lamb with the book with the seven seals. Each compartment has one of the evangelistic beasts in a circle (the lion is remarkably spirited), while the ribs contain angels standing upon the four winds, represented as crouching male figures; below are the four greater prophets. The easternmost arch—*i.e.*, that over the chancel arch proper, is decorated with circles, each of which contains one of the twenty-four elders. This arch encloses a lunette-shaped window. Below it is the altar of God, with an angel on either side; that on the dexter holds a censer, and kneels on the steps. This is a particularly good figure. The sinister angel is flying and holding out a book. The other figures in juxtaposition are the New Jerusalem, a female figure adorned as a bride (not very good) who looks at a tree and birds, labelled "terra renovata;"—the woman standing on the moon, who threatens with the cross the seven-headed beast;—two of the terrible horsemen—*i.e.*, the one on the pale horse, and the one who holds the scales. These are, perhaps, the weakest figures of all—the horses' backs are curved inwards in a most unnatural manner. On the great pillars are the Apostles. The nave waggon vault is painted to represent a purple velarium, with embroidered angels, two to each compartment. This velarium is supposed to be attached to an architectural composition of a very nondescript character. It should be observed that M. Lameire dresses all his angels in rich Byzantine costume, and that they consequently have covered feet, the reverse being the rule of our western iconography.

As before observed, the most prominent portion of the decoration is the great procession in the upper part of the triforium; it represents the various nations coming to be judged. This procession occupies the northern wall of the north transept, the five bays of the nave, and a small piece over, which may probably be supposed to occupy part of the west end. This leaves the eastern and western sides of the north transepts, and the whole of the southern side of nave and of the south transept unaccounted for. Probably M. Lameire has remembered that there are other nations besides the French, and has accordingly left space for them. As it is, the procession opens with Nebuchadnezzar, and ends with Napoleon I.

Transept, north face.—Nebuchadnezzar in his chariot; behind him are captives; then follows Belshazzar crouching beneath a circle containing the hand of God, and the words "Mene tekel upharsin." After him comes Cyrus on horseback, riding down a woman and child.

We now begin the compartments of the nave. The first one presents us with Cæsar Augustus in a chariot, dragging the captive nations behind him. Why not Julius Cæsar? or has the artist selected Augustus on account of the similarity of features between him and Napoleon. The rest of this compartment is occupied by Attila reclining on a litter borne by warriors: his weapons and a human head are suspended from a corner. The second bay opens with figures of Rome and Constantinople, followed by Constantine on horseback, holding the labarium; he is clad in Byzantine costume, which must surely be an anachronism. His horse tramples on the prostrate head of a colossal statue of Zeus. Behind him comes Baldwin of Flanders, the first Latin emperor of Constantinople; he holds the banner of Jerusalem, and is accompanied by the lion of Flanders. Last of all we have Constantine Dracos, the last emperor; he is preceded by a group of clerics holding the picture of the Virgin and Child, and others bearing long flabelli. The object of this group is to balance the equestrian figure of Constantine.

The third bay of the nave begins the history of France. First of all march St. Clotilde and St. Genevieve, followed by Clovis on horseback, accompanied by Gregory of Tours. Charles Martel, naked from the waist upwards [why?], leads the horse of Charlemagne, who holds a sword in one hand, and stretches out the other, which grasps the orb. This is a very excellent figure. His horse tramples on a Saxon idol. Louis, Lotharie, and Pepin, dividing their cloak, symbolical of the division of the empire, close this division.

The fourth bay is particularly good. First of all are the walls of Jerusalem, then Peter the Hermit kneeling, then Godfrey of Bouillon accompanied by his standard-bearer. The costume, if anything, is rather later than Godfrey's time, and the mail gloves are divided into fingers, an improvement which did not take place until long afterwards. Then comes St. Bernard, and then two more kneeling figures, representing a templar and a father of mercy. The latter figure is exceedingly expressive. Last of all, the good St. Louis on horseback, making a group with a blind knight, a widow, and an orphan, suggestive of his charitable foundations. The colour of this group is about the best of the lot. The blue robe of St. Louis is contrasted with the bluish green of his horse housing. The figure of Joinville is not very good.

The fifth bay continues the French nation by Joan of Arc on horseback trailing an English banner. Here, again, M. Lameire's archæology is at fault. In Joan of Arc's time the arms of England were France and England quarterly; here England alone is given.

We can easily forgive a Frenchman for putting the Imitatio Christi in the hands of Gerson, who follows Joan of Arc, although there are several other claimants for the book. Then come two groups, the first being De l'Hopital and Achille Harlay (at his feet a representation of the Bastille), and the second composed of Turenne and Bossuet. Louis XIV. on horseback follows. Like St. Louis he is accompanied by an invalid and a cadet, in allusion to his military foundations. Behind him is Vauban. The last figure is that of a member of the Assemblé National (no name given); at his feet is the Bastille in ruins.

The sixth division, which we may suppose to occupy a portion of the western wall, is devoted to Napoleon I., who is on horseback. He is preceded by two female figures, representing Milan and Paris, the former bearing the iron crown and the latter the imperial crown and the sceptre ending with an ivory hand. It is well known how Napoleon tried to surround himself with what may be called the properties of former dynasties, and for this reason made use of sundry of the sceptres, &c., kept at St. Denis. A story is told that the sceptre of Charlemagne turned out upon examination to be nothing more than a verger's staff of the fourteenth century. It is true that the inscription was filed off, but the sceptre was nevertheless used at Napoleon's coronation, and gave rise to sundry epigrams. Surely "Napoleo. magnus divini cultus restaurator," as he is called in these drawings, was great enough to have had a crown and sceptre of his own. Attached to Napoleon are two figures—viz., of a deacon and of Cardinal Gonsalvi holding up the Concordat.

Now, there is much to be learnt, both as to colour and as to composition, from these drawings. Firstly, as to colour. If we retire some distance and view them as a whole, we shall see that the colour is not quite satisfactory. It is true that there are parts of it, as in the figure of St. Louis, which are good, but the whole effect is dull and very far from the joyous colouring we see in the early Italian works. The ground is a warm white, the outlines and details are executed in black lines, and the colouring is in broad masses, partially shaded. Of course the broad masses are all right; but it becomes a question whether the shading might not have been reduced to a minimum, and the colours broken up by others worked into them.

But, after all, colour is so much a gift that it is impossible to lay down any rules upon the subject, for it is quite possible to produce a far better effect than M. Lameire has done by the very system of shading that he has adopted, while an inferior artist might use broken tints and abjure shadows without coming at all up to the mark of the present pictures.

When we consider the composition we are enabled to give M. Lameire almost unmixed praise. The system upon which these compartments have been composed is, that each should contain two figures on horseback, or, at all events, something which should go up to the top of the picture, and thus form an equivalent in height and breadth to an equestrian figure. Thus Attila in his litter balances Augustus in his chariot; the group of priests (in the second bay) holding up the holy image and the flabelli, balance Constantine; and Godfrey of Bouillon and his standard-bearer balance St. Louis.

The next thing to be observed is the way in which the void spaces occurring between the figures in the upper parts of the compartments are filled up. Thus we see the hand in the circle over the crouching Belshazzar; a shield is placed close to Joan of Arc; a cloud rising from the ground and spreading at the top, and labelled "Ira Dei," occurs several times; the walls of Jerusalem have a cross above them and rays proceeding therefrom.

Observe also the arrangement of the lower portion of the compartments, where solidity is more necessary than at top—the figures, more or less, run into one another and are made to touch. Thus the horse of Louis XIV. touches Bossuet's robe; Bossuet is grouped with Turenne (for single figures would look too thin and weak); the left leg of Turenne touches Harlay's robe; and the Bastille enclosed in a quarter of a circle connects his robe and the figure of his companion De l'Hopital with the end of Gerson's robe. Gerson, again, just touches the English banner trailed on the ground by Joan of Arc, and the space between her horse's legs contains a semi-circle enclosing the funeral pile, with the inscription "Rotomagi, MCDXXXI." Thus the whole of the figures are more or less connected with each other, and a continuous stream of colour obtained at the bottom of the picture. It will be observed that each of the equestrian figures has other figures at the side, so as to fill up the spaces between the horses' legs—sometimes a prostrate idol does the same office as in the case of Constantine.

It is rather a difficult matter to define the style of these designs. They may perhaps be described as partaking almost equally of the Nenivite, Byzantine, and twelfth century styles, all welded together with modern drawing; but whatever may be said about the evils of eclecticism, certain it is that M. Lameire has produced an excellent effect and has showed us the way for our modern monumental work. It is to be hoped that these designs will not remain upon paper, but that their author may have an opportunity of showing that his hand has lost nothing of its cunning nor his heart any of its divine gifts by producing these drawings full size upon an actual wall: and not these designs only, but others which will tell us the truths of religion and the traditions of history in a manner if anything better than we now see in Conduit-street. It now only remains to give a very short account of the nine large drawings, which I will do next week.

W. BURGES.

ROYAL BOTANIC SOCIETY'S COMPETITION.

A PRIVATE competition is going on at the Royal Botanic Gardens, Regent's Park, for the extension of the winter garden or conservatory. This, then a large work of the class before Crystal Palaces were known, was designed by Mr. Decimus Burton, architect of the society, as far back as April, 1845. A competition then took place, and the premium and execution of the work were awarded to the Messrs. Turner, of Dublin. The original design proposed a large covered garden, so that the place could be frequented by the Fellows in winter as well as in summer, the Botanic Gardens being chiefly frequented in the fine season. The cost was estimated at about £40,000, but only about two-fifths of the plan was carried out, at an expense, we believe, of about £15,000, raised by debentures. A quarter of a century has nearly elapsed, and the want of the accommodation is still as much felt by this fashionable society; but the ancient spirit no longer rules, and although the greater part of the debenture debt has been paid off, the council, instead of doubling the winter garden by such financial resources, propose to make a small enlargement by private subscription of about £2,000, which will most likely fail, even if it be not rejected by the Fellows. At present the place is no more than a large conservatory, while, had the original plan been carried out with a varied surface, suited for what are called American exhibitions or gardens of rhododendrons and kalmias, we should have had a unique winter resort in London. The same taste which has reigned in other works of the society's landscape artist, Mr. Marnock, was promised to be exerted in this instance.

The former competition for the winter garden was memorable because Mr. Turner, of Dublin, gave the first idea of a large crystal palace. This he afterwards again applied in the competition for the Exhibition building of 1851, when a scandal was created among those who knew the facts by the acceptance of Sir Joseph Paxton's famous pen and ink drawing and Mr. Turner's rejection. In those days it was quite fruitless to bandy truth with the clique which worked in the name of H.R.H. the Prince Consort, the alleged inventor of a great international exhibition, of which poor Francis Whishaw was the authentic originator.

The council, in their new scheme, it appears, have hesitated between lateral extension of the Winter Garden and a covered approach, and designs for both have been sent in, though there will only be funds for one, if for either. In fact, the idea of the covered approach is one of the lame expedients of a weak body. The site of the present winter garden is at the head of the grand walk, leading from the York Gate main entrance, and at the back there is another gate in the circular fence, about 200ft. back from the winter garden. All this space was proposed to be covered with glass, when there would have been a carriage entrance into the building, and invalids and the healthy would at once be under cover. As only a portion of Mr. Decimus Burton's design was executed, it was supposed provisionally, there is no access in winter except by a long walk not well kept.

One scheme is, therefore, to make a carriage drive within the fence, and put down a covered walk of 150ft. by 12ft., having a brick wall on one side. This is best shown in Mr. Ormson's drawings, though also exhibited in those of the two other competitors. Mr. Weeks's estimate is, we believe, £1,500. This contrivance would be ugly and lob-sided, as also inconvenient, and stand in the way of a future extension. 12ft. would not be wide enough to afford conservatory space in summer or winter and play for wide skirts or long tails, and it would be bad standing ground for visitors in summer. The scheme of the council is, we imagine, if they do not get the £2,000 for the wings, then to spend £1,500 on this passage, and, of course, no suitable gate would be erected on the north side, and no architectural effect be obtained. We have strong ground for believing that neither Mr. Burton, the architect, nor Mr. Marnock, has anything to do with the arrangements, and that it is completely under amateur auspices.

Curiously enough, after nearly a quarter of a century, Messrs. Turner, of Dublin, appear in this competition. They send in four designs. Mr. Burton's elevation is maintained by all the competitors, and they follow an alternative plan of extension originally presented by him. At present the façade terminates on each side with a small low lean-to. These Messrs. Turner propose to remove, substituting on each side a wing with a circular front, to correspond with the centre compartment, though of smaller dimensions, being only 30ft. diameter, the total extension being, therefore, 60ft. in the front. The lean-to's would be replaced outside.

Messrs. Weeks, of Chelsea, send six drawings, but, as stated, they are partly occupied with the approach. The width of their wings would be 31ft. 10in., or a total of 63ft. 8in. They make a slight alteration in the curve of the wing roofs. Mr. Henry Ormson, of Stanley-bridge, Chelsea, sends one drawing of the approach. This looks low, with a flattish roof. In the public interest it is to be hoped the council will fail in their scheme, the execution of which will not rescue the society from the danger of effete management. While the public have moved on there has been no change at the Royal Botanic for twenty years. An outlay of £20,000 to create a real winter garden will restore it to its pristine fashion and popularity, and the £20,000 can be redeemed as the £15,000 debentures have been.

SANITARY CONDITION OF CROYDON —PAST AND PRESENT.

A REPORT on the permanent sanitary works, and their cost, executed in the parish of Croydon, under the authority of the Local Board of Health, has just been published by Mr. Baldwin Latham, engineer to the board. There are few persons at present living in the parish who can form any adequate idea of the state of things that existed before the adoption of the Public Health Act. As some proof of the unhealthy state of things at that time existing in Croydon we find in 1809 an Act of Parliament passed enabling the Archbishop of Canterbury to alienate the site of his palace, the situation being described as damp and unwholesome. Dr. Westhall, speaking of the position of the town at that time, says: "In the lower parts dense fogs prevail and hang upon the surface in the vicinity of Southbridge and Bog Island, whilst at or near Waddon there are marshes with stagnant ditches from 12ft. to 15ft. wide, charged with animal and vegetable matter, from which noxious exhalations are conveyed by the prevailing winds to the town. Moreover the town itself is entirely devoid of under drainage, and therefore dependent on a surface drainage, which is a source of unhealthy exhalations giving rise to epidemics which have of late years increased." Many other authorities concur in testifying to the unhealthy and in some parts positively filthy condition of the town and neighbourhood. The returns of the Registrar General prove that the district was the "most unhealthy in the county, the proportion of annual deaths being 1 in 36, against 1 in 58 elsewhere." At length the inhabitants determined on the adoption of the Public Health Act in August, 1849. In September Mr. Donaldson and Mr. Thomas Cox, who had been appointed surveyor, were called upon to advise and report on a scheme of sewerage and water supply, and in the following year the General Board of Health sanctioned the borrowing of £32,965 for the purpose of carrying it into execution. Croydon was almost the first town that tried at that time the new system of tubular pipe sewers, and its prominence has brought upon it the attacks of all those who disagreed with the system then introduced. Other towns have profited largely by the experience of Croydon. Of the great errors committed in the early works, one was the too small size of some of the sewers, another the want of sufficient strength, as the sewers themselves, 15in. pipes, having only a thickness of $\frac{5}{8}$ths of an inch, collapsed even when laid at moderate depths. The original work, too, had been scarcely brought to a close when the town was visited by an epidemic of fever, which it can scarcely be doubted was due to the entire absence of any system of sewer ventilation. A remedial plan was at the time adopted, but a more perfect system has been substituted within the last eighteen months. The total area of the district under the jurisdiction of the Board is 9,821 acres, and as at the time of the commencement of their drainage operations the houses were scattered in groups some distance apart, and each group had its separate sewer, a number of outfall sewers at various points was the consequence, which, after frequent complaints, have to some extent been centralised. The original sewerage plan, as altered by Mr. Ranger, the then engineer of the Board, consisted in allowing a partial separation of the coarse matter by means of intercepting wells and strainers, and clarifying the finer sewage water by means of filter beds, after leaving which the water was to be allowed to flow away into the natural watercourses of the River Wandle. In his recommendation of his plan, he stated that "The works proposed would remove the sewage and allow the water it contained to flow away comparatively pure and certainly inoffensive." On the faith of Mr. Ranger's report, the Board established their works of filtration and deodorisation. They, however, very soon found that their works had but little effect in purifying the sewage, and that the most objectionable portion entered and polluted the river to a large extent. No less than nine actions and injunctions were brought against the Board in order to prevent their continuation of the works. Every known mode of dealing with sewage by deodorisation, filtration, and precipitation was tried, and large sums of money fruitlessly expended. At one time the Board actually sought to relieve the town from its difficulty by obtaining an outfall for their sewers into the metropolitan system of drainage, and went so far as to lodge a bill in Parliament that should give them the power they could not otherwise obtain. At length by the passing of the Local Government Act of 1858 powers were given to local boards to carry sewers, &c., out of their district, and to take land for the purpose of irrigation. By the adoption of this method they were at length enabled to carry out their original scheme of applying sewage by irrigation to agricultural purposes. The Board have now under their control 75 miles of sewers, of

which 23 miles have been constructed under Mr. Latham's supervision.

One of the first cares of the Board was to secure a good water supply. In this they were more fortunate, as by the construction of works, which with the extensions up to December, 1863, cost £26,553 14s. 8d., they obtained a supply of one million gallons per day. The rapid increase of the population rendering a larger supply imperative, a new well has since been sunk, which yields an additional supply of 2,000,000 gallons.

The total expenditure for the purchase of land, construction of sewers, &c., and waterworks, has amounted, since the commencement, to £196,135 6s. 5d. The result of these works is, that the death rate of the town has decreased from 28·16 per 1,000 in 1848, to 16·6 per 1,000 in 1867, and the birth rate has increased from 29·1 per 1,000 to 31·4 per 1,000. Of the results of the application of the sewage to land Mr. Latham speaks in sanguine terms. The difficulties of procuring suitable land have been great, and, in fact, appear to have been the most serious obstacles to the success of the scheme.

ART FURNITURE.

WE believe that the attempt recently made by the Art Furniture Company to encourage a taste for furniture of better design and construction than that at present in vogue has proved a failure. Either the business operations of the company have not been characterised by sufficient commercial energy, their goods were far too expensive, or love of art has made very little progress, and the common public still prefer the meretricious designs of the modern upholsterer. It is just possible that each of these causes may have contributed to failure. Of course, with a demand at first necessarily small, and good workmanship by no means to be at once easily and cheaply obtained, it was next to impossible for the company to compete in price with the ordinary upholsterers. Yet, viewing their attempt, as we did, with general approval, we cannot help thinking that they might have found a wider field, and possibly a larger amount of success, had they shaped their course a little more on ordinary commercial principles. The prices asked for some of their furniture, though not perhaps exorbitant viewed simply by themselves as works of art, were certainly very much dearer than those charged for common upholstery. Doubtless, with an increased demand a more reasonable scale of charges would have followed; but ordinary people do not see the force of furnishing at an extra cost of 50 per cent. solely for the purpose of encouraging a love of art in their neighbours. Still, if the scheme had been only burdened with this objection, it should have met with support from the wealthier section of society. It evidently did not; and we fear the reason is to be found in the absence of art feeling—in the nineteenth century love of change and fashion, that too well characterises ourselves and our surroundings. As far as we can see, the sole merit of modern furniture consists in its newness of appearance and novelty of design. No matter how fantastical and absurd as long as the design is something novel—something different from anything that appeared last season—it is almost sure to be sold and sent home in all the glory of gold leaf and French polish. In a very short time the gilding fades, the varnished surfaces are dimmed and scratched, and the article, being made on totally false principles of construction, is seized with a violent attack of the rickets, and is finally turned over to the brokers, or hidden from sight in the lumber room to tumble to pieces. Furniture now at the best is never expected to last more than one lifetime; more than this, it is never *wanted to*. Yet this was not the case two hundred years since. Articles of furniture then were heirlooms, passed down reverently from father to son—the adornment of the house and the glory of the good housewife. But we have improved on all this. Could the "wife of the period" be expected to fill her house with her parents' old rubbish—tables, sideboards, and chairs without a particle of polish on them—nothing but plain wood? What is it to her that they are solidly constructed, of good material, and have all the charm of tone and colour which age alone imparts to wood, and which now is never seen under the coating of varnish? Something new must be had, and so the upholsterer is called upon to ransack his brains for patterns—we cannot say designs—a little more absurd than the last. Of course, this is not the only phase of modern ugliness in furniture; there is another, if possible, still more absurd. Some householder, generally an illiterate *parvenu*, becomes possessed with what we will call the antique itch, and forthwith Gothic furniture of the true Wardour-street type appears throughout his house. Gothic chairs in his hall, Gothic clocks, Gothic statues defiantly bearing Gothic shields inscribed with Gothic armorial bearings, Gothic bookcases; and if his wife be a ritualist, probably a Gothic oratory in her bedroom—all this pseudo-Gothic furniture, attempting to imitate its original pure model, marred by all the hideousness of false construction.

Has it really come to this—that we are only left to choose between these two evils? Are all the existing race of architects far too gifted, far too highly engaged in designing cathedrals, courts of justice, and townhalls, to condescend to such a trivial thing as the designing of furniture? We know they are not. The work which Pugin so well begun—marred though it was by extravagant decoration—has been well carried forward by Burges, Seddon, Eastlake, Goldie, Godwin, and others, who have returned to earlier, simpler, and purer styles than those he practised. What, then, do we want? More hearty and spirited co-operation among members of the profession in some fresh effort to educate the public taste. But to meet with success it must be made to meet modern requirements, to compete with modern prices, and yet to retain all the grace and beauty of the older forms. The prospect is, after all, not quite so dark as it seems, looking at it by comparison. It is not so very long since ecclesiastical furniture was in almost as pitiable a plight as domestic furniture is now; and that a vast improvement has taken place in that it is impossible to deny. True it is that there exist for our guidance and study all the best examples of old church furniture, and but very few of the domestic variety; true, that the improvement that has taken place was aided to a great extent by the great revival of Catholic doctrine and practice in the Church; and unfortunately too true that notwithstanding that improvement the name of the number of monstrosities constantly being brought into existence is legion. Yet we take heart of grace, and patiently, but confidently, look for some new attempt in the right direction, to be, if possible, more ably conducted, more heartily supported, and to meet, we trust, with more success.

THE CHURCHES, CHURCHYARDS, AND CALVARIES OF BRITTANY.*

WHETHER ancient or modern, great or small, every Breton church has its open belfry, making it visible from a distance. These open belfries are the glory of the church, and the pride of the inhabitants. At Quimper, entirely at the cost of the faithful, thanks to a popular subscription, the two pinnacles of the cathedral have been built; Mgr. Graverau, bishop of the diocese, having opened a yearly subscription of a penny a head. At Lambour, near Pont Labbé, it was on the belfry that was wreaked the anger of Louis XIV., who wished to punish the peasants for having revolted at the stamp paper tax. It is impossible to understand this irritation, but it may be in some degree explained by the important part which the belfry fills in the imagination and in the customs of the Bretons. Like the church towers of the Flemish cities, to destroy it is to wound the inhabitants in their independence and in their dearest privileges.

The principal door of the church is not under the belfry; that is long, narrow, and massive, in order to support so great a weight. But on the right side of the edifice, a large square porch opens, which by its projection, by its artistic merit, and by its double doors, constitutes its real entrance. On the right and left are engaged columns, with spiral mouldings, above which rises a pointed arch or one with a depressed centre; in the interior, on either side, are ranged niches containing (where the Revolution has not destroyed them) statues of the twelve Apostles. In the centre, between the two doors, a group of small columns; below, the holy water stoup; above, a niche intended for some statue of our Lord, of the Blessed Virgin, of St. Peter, or of the Eternal Father. This porch is generally called "the Apostles' Porch;" there is no corresponding one on the left side of the church. That of St. Houardon, at Landerneau, was taken from the ancient church to be added to the new one built in 1860. The date of the porch is 1607. I have remarked also that of St. Goueznou, distant from Brest two kilomètres, and that of La Roche-Moriee, above Landernean. The porch of Daoulas is the most ancient of all. It is generally for this part of the exterior of the churches that the architect reserved his powers; sometimes even his freaks of imagination. Before entering the church let us walk through that which surrounds it, the cemetery. Its appearance has nothing sad about it. Four rows of elmtrees follow the line of its walls; poplars, yews, and plane trees separate and group the tombs into squares. At Plougastel, each tomb is adorned with bushes of Bengal roses, which are all the year round in flower. A little hole is piereed in the stone to receive holy water, or a little vase, a potsherd, or broken bottle, fulfils the same purpose. In front, and at the sides of the church, nearest to its walls, are the tombs of the parish priests; at St. Goueznou, the faithful have placed in memory of their rector, M. Cloarec, a statue representing him on his knees; close to this the former priest, who died at the age of forty-six, is represented with his sacerdotal vestments in a tomb, in half-relief. At the entrance, or in the corner of each cemetery, is to be seen a little low building with a pointed roof; this is the ossuary, that is to say, the place in which are collected all exhumed bones. Ossuaries are to be met with at Daoulais, at St. Goueznou, at Quimper; the most elegant one that I have seen is that at La Roche-Moriee. It dates from the seventeenth century. In ten compartments, each formed by two Corinthian columns, the artist has drawn the personages of the Danee of Death; in the centre is Death holding an arrow. Above is written, *Je vous tue tous.*

Calvaries are also ordinary accessories and ornaments of Breton cemeteries. A calvary is a huge granite cross raised upon steps; it has generally a face and a reverse. On the face, at the point of intersection, is a little figure of our Lord crucified sculptured with Byzantine stiffness and coarseness; at the extremity of one of the arms of the cross, the Blessed Virgin; at the other St. John. On the reverse, at the point of intersection, the Blessed Mother holding the body of her Divine Son on her knees (what is commonly called a *Pietà*); on the right and left, Saints and Apostles. Notwithstanding the rudeness of these sculptures, they produce a happy effect. In a calvary before a charming chapel, dedicated in honour of St. John, which stands in a grove of beech trees on the left shore of the El-Orn, opposite Poule Ar-Vilin, on either arm of the cross are angels bearing the instruments of the Passion. The calvary of Confort, near Pont Croix, is worth a visit; but the most curious, the most complete, and the most original of all those in Brittany, is that of Plougastel-Daoulais. Three crosses, those of our Lord and of the two thieves, stand over a polygonal arcade, which is supported by pillars and arches. The frieze which surrounds it is adorned with a series of bas-reliefs describing the Life and Passion of our Lord. I can only allude to them briefly, and shall therefore content myself with the single observation that all these figures, none of them lacking either character or originality, all these religious scenes of which the customs and the dresses are thoroughly Breton, in no single respect bear witness to the period at

* By M. VICTOR PIERRE. Translated from the "Revue de l'Art Chrétien," and reprinted from the "Ecclesiologist."

which they were made. The date is cut on the frieze: we read 1602. How is it that after all the great works of the fifteenth and sixteenth century, these seem to be the performance of some backward pupil of the twelfth or thirteenth? We might make this remark over and over again in Breton churches: they have an air and a style more ancient than their date; their architects and their artists have never changed their atmosphere and the breath of time has not touched them.

From the exterior let us pass to the interior of the church. There are several churches which are divided into two naves of equal width by three or four pointed or round-headed arches rising about 10ft. above the ground. This line of arches ends at the choir, which has two altars, one for each nave. This arrangement, I have been told, ought to be attributed to the Templars, who have had several important houses in Brittany, and built many churches in it. One often finds Pointed churches of the ordinary plan, that is to say, one principal nave with two low aisles on either side. But the apse, instead of being almost circular, generally ends in a straight wall, against which are placed three altars corresponding to the three naves. The vaults are in wood. Sometimes one meets with friezes in sculptured wood, such as those at St. Goueznou and at La Roche-Morice, which represent in a long series of scenes the labours of the country, its manners and customs, agriculture and fishing, burials and marriages. On the low walls, round the choir, are hollowed-out panels, empty for the most part, but which once bore either a tablet with a mortuary inscription, or a representation of the deceased. Near the church doors, wide and high granite benaturas, emblazoned and adorned on their sides with bas-reliefs, testify to some antiquity. Notwithstanding the demolitions of the end of the last century painted glass is not very rare. I saw some that was beautiful at the church of St. Nonna, in Penmarc'h, and also elsewhere.

I visited several churches, built only five or six years ago. They are worthy of their elders by the harmony and good taste of their proportions. I must mention particularly the church of St. Mark, near Brest; that of Conquet, whose belfry was brought from Lochrist; those of Landerneau and of Trégune. How little does the church of St. Clotilde, in Paris, resemble, at least externally, its sisters in Brittany! They are like wild flowers which perpetually reproduce themselves with a never-failing freshness; while it, like a hothouse plant, grows pale and fades. These village churches, whether old or young, are all interesting in some way or other; one cannot say so much for the churches of the great towns. The architecture of civilisation has passed that way, and affords to the curious every specimen of inelegance and of ugliness which they can desire. The churches of Brest, built under Louis XIV. and Louis XV, answer to this description, but are scarcely types of their kind. Vannes takes precedence of Brest in the Church of St. Patern, a building of the eighteenth century; a mass of stones and bricks without ornament, adorned with a peristyle weighed down by a tower, which in its turn carries a lantern as broad as the church; and the interior of the church is worthy of the rest. What! said I to myself, is that a work of the eighteenth century, the century of elegance, of lightness, of coquetry! What! is that the church which bears the name of the first Bishop of Vannes! But among the catalogue of monsters, the cathedral of Rennes well deserves a place. The architect, who was, I suppose, an eclectic, has conceived the thought of fastening on to a basilica, the inside of which reminds one of St. Vincent de Paul and of St. Roch, a porch adorned with two towers, each with four stages of heavy columns, which are intended to figure as Gothic towers rejuvenated and regenerated by the Greek style.

NORWEGIAN CHURCHES.

WE find, says the *Ecclesiologist*, in the last brochure of the *Norske Bygninger fra fortiden*, some interesting illustrations of two curious Norwegian churches. *Hove Kirke* is a small structure consisting of nave, so short that it is scarcely more than a square on the plan, a very small chancel with semicircular apse, and a western tower. The arch between the chancel and the nave is so small and narrow as to be scarcely more than a door. The chancel has a door (answering to our priest's door) on its south side. There is a well-moulded arch to the apsidal sanctuary, which has three deeply-recessed round-headed quasi-Romanesque windows. The altar, a solid mass of masonry, with projecting mensa (in which is sunk a reliquary on the top surface), stands isolated on the chord of the arch. The nave has two small deeply-splayed lights on each side, and a small door on the south-west. A door opens into the tower from the nave; and the tower has a small external door at the west side. The whole structure is evidently of late Romanesque date.

The other church, *Dale Kirke* (in Lyster), consists of a nave with square-ended chancel. The chancel has a single deeply-splayed lancet light in the east wall, and a similar one on the north side; one on the south side seems to have been modernised and enlarged. The chancel arch is wide and without mouldings. Here too the altar, a solid structure, stands free from the east wall. The nave has a single deeply-recessed light on its north side; two windows (one of them composed of two lights), and a small door on the south side, and an elaborately moulded west door. This church belongs to the earliest transition from the Romanesque to the Pointed style. The windows are lancet-headed. The two-light window is composed of a very slender and elegant shafted pier. The south door, which has a pointed head, has a curious mixture of earlier mouldings, among which some dog-tooth ornament is very conspicuous. The west door is a really beautiful first pointed composition; richly moulded, with several shafted orders, and an abundance of dog-tooth ornaments, and fancifully carved capitals. The labels and other details have a curious and most characteristic tendency to the lacertine patterns of Scandinavian ornamentation. The actual door is the ancient one, covered with wrought-iron floriated hinges and foliations.

THE RAILWAY BRIDGE AT RUNCORN.

THE huge railway bridge on the London and North-Western Railway, which spans the Mersey at Runcorn, was publicly tested on Thursday week. It is a trellis girder bridge, is nearly 1,000ft. long, supported on piers at an altitude of 75ft. above high water mark, thus allowing vessels of considerable tonnage to pass underneath. It is divided into three lengths of 327ft. each, the extremities of the girders resting on lofty stone piers; two of which rise from the bed of the river, and the other two being near, though not actually upon, the shore. There is a clear space of 305ft. from pier to pier. The piers are constructed of red brick, faced with Yorkshire stone, and are each crowned with a small battlemented tower, which serves to break the otherwise uninterrupted straight lines of the bridge. Three arches on the Cheshire side and five on the Lancashire side carry the bridge over the remaining parts of the river which are not spanned by the girders. These are succeeded on each side by a long viaduct, and that by an embankment with an inclination of about 1 in 120. Altogether, independent of the girder bridge, there are 97 arches, 65 being on the Lancashire side and 32 on the Cheshire side. Those which form the viaduct have a span of 40ft. The river arches are built of yellow brick, and the remainder of darker coloured materials, the contrast greatly adding to the effective appearance of the bridge, which, moreover, possesses none of the ungainly stiffness that frequently belongs to structures of this nature in consequence of the approaches necessitating the curvature of the viaducts, so that the whole structure, which is close upon a mile and a half in length from end to end, takes a serpentine form. The width of the bridge is 38ft., measured to the outside of the girders; it is 25ft. between the girders, and there is a footpath 6ft. wide on each side.

The bridge was designed by Mr. W. Baker, C.E., chief engineer of the company, and was constructed by Messrs. Cochrane, Grove, and Co., under the superintendence of Mr. J. P. Ashton, one of the most experienced of their staff, and Mr. S. B. Wells, the company's resident engineer. The cost of the bridge is a little over £250,000.

For the purpose of testing the bridge, sixteen locomotives, each loaded to a weight of 50 tons were placed on the lines. In addition to this about 90 tons of material were placed on the footpath, making a total, including the weight of the girder itself, of about 2,000 tons weight suspended between two points, 300ft. distant. The result was eminently satisfactory, the bridge stood firm as a rock, scarcely vibrating under its immense load. We may state that it is constructed to bear a weight of 5 tons to the foot, and that on Thursday week only about a ton and a third were placed on it, although that is very much in excess of any weight it is likely to have to bear in ordinary use.

BUILDERS' BENEVOLENT INSTITUTION.

A GENERAL meeting of the friends and subscribers to the above charitable institution was held at Willis's Rooms, King-street, St. James's, on Thursday, the 28th ult., for the purpose of electing two pensioners on the funds—one male and one female—from a list of nine candidates. Mr. W. R. Rogers (president) occupied the chair, and expressed his regret that they were not then able to elect a greater number, but hoped that the funds would allow another election in the present year. The amount of stock is £11,298 15s. 3d. for the Relief Fund, and £2,920 4s. 6d. for the Building Fund, making a total of £14,218 19s. 9d.

At the close of the poll the following were declared to be the successful candidates:—G. H. Mitchelmore, 74, St. Peter's-street, Islington, aged 75. He is incapacitated from following any occupation, being subject to frequent fits of epilepsy. Maria Unwin, 4, Eden-terrace, Bridge-road, Battersea, aged 67, widow of a builder, late of Peland-street, Oxford-street. She is very deaf, with declining health, and her earnings not amounting to more than 4s. a week. Her distress was caused by the failure of her husband in business. The usual complimentary votes concluded the proceedings.

INDUSTRIAL EXHIBITIONS.

EXHIBITIONS seem to be the order of the day. An industrial exhibition was opened at Abbot's Anne, near Andover, Hants, on Monday last. It consisted of useful and ornamental articles contributed by people in the neighbourhood. An industrial exhibition was promoted by Sir Antony Rothschild, at Halton, in Bucks. This exhibition consists of specimens of lace, silk, furniture, straw plait, implements of husbandry, &c., manufactured in the county; also of specimens of inventions and plans for improving the dwellings and promoting the social improvement of the labouring classes. Is this the same Sir Antony Rothschild to whom the Whitechapel vestry have unavailingly appealed about the nuisance arising from his sugar refinery in Whitechapel? If so, the same gentleman who is endeavouring to promote the physical health of the agricultural labourers of Buckinghamshire is assisting to impair the health of the citizens of London. The maritime exhibition at Rouen, which was opened on Sunday last, is reported to be a success.

THE BURLINGTON FINE ARTS CLUB.

THE Burlington Fine Arts Club, in Piccadilly, are now exhibitiog at their rooms, 177, Piccadilly, a collection of the engravings of Raimondi, more generally known as Marc Antonio, one of the earliest and one of the greatest of Italian engravers. There is a charm about these early and rare examples of ar. art that is now so familiar and so prolific which will be recognised by all those who can derive pleasure from the contemplation of grace and beauty as developed in form, though some of those specialities which give almost fabulous value to certain impressions may not be acknowledged as lending any additional attraction to the general spectator, who cannot be supposed to care whether one plate has the *chicot* or not, another is with or without the "two forks," or a third represents the Virgin with her arm bare or covered. Marc Antonio was the contemporary and companion of Raffaelle and Michael Angelo, and has translated their special characteristics into the black and white of the copper plate with more truth and force or grace than any other engraver. Working under direct communication with Raffaelle he seems to speak with the great painter's own language, and in the purity of his forms, the delicate firmness of his outline, and in his simple force of expression, we seem to come in contact more closely with the creative mind of the artist than even in finished paintings. It is remarkable by what apparently small means such perfect ideas are conveyed. As many as between five and six hundred productions from Marc Antonio's hand have been catalogued. Of course they are not nearly all here, but the collection is a very fine one, and includes many of the rarest as well as the most interesting from an æsthetic point of view of the acknowledged works. An illustrative memoir has been drawn up by Mr. Richard Fisher which will be found to render great assistance in the proper appreciation of these engravings, giving, as it does, such a well written and complete account of the artist and his productions as to render any other account unnecessary.

MR. RUSKIN ON LIFE AND ART.

MR. RUSKIN has been lecturing on "The Mystery of Life and its Arts" at Dublin. There is an element of the mysterious if not of the paradoxical or contradictory, in all that Mr Ruskin writes; and when he calls us together to lecture on something professedly mysterious, we may expect something unusually imaginative, and on this occasion we are not disappointed. From the newspaper report of the lecture which has reached us, it is difficult to ascertain the point towards which the lecturer endeavoured to steer. In the course of the lecture he said that ten years of the early period of his life were devoted to endeavouring to show the excellence of the works of a man whom he believed to be the greatest English painter since Reynolds. He had then perfect faith in the power of every great truth to prevail ultimately, and to take its right place for usefulness amongst men. Turner, during his lifetime, knew better than he did, and discouraged his views. His books, however, got talked about, and he began to hope for victory. The trustees of the National Gallery commissioned him to arrange 300 examples of the great painter's studies in the Kensington Museum. Accordingly they had been placed there; but they were not exhibited, for the room in which they were hung was always empty. That showed him that ten years of his life had been practically lost. For that he did not much care; but what he did care for was the (to him) frightful discovery that the most splendid genius in art might be permitted by Providence to labour and to perish uselessly—that in the very fineness of it there might be something rendering it as invisible to ordinary sight as an Eleusinian mystery—that the glory of it was perishable as well as invisible—that the gift of it might be as snow in summer and rain in harvest. That was the first mystery of life to him. Amongst several personal reasons which caused him to give this prosing lecture in Ireland, one of the chief was that in reading it he should be near the beautiful building, now their Engineers' School, which was the first realisation he had the joy to see of the principles he had been endeavouring to teach, but which, alas! was now no more than the richly-designed monument of one of the most earnest souls that ever gave itself to the arts—Benjamin Woodward. But it was not in Ireland only that he received the help of Irish sympathy and Irish genius, for to another friend of his—Sir Thomas Deane,—with Mr. Woodward, was entrusted the building of the museum at Oxford; and the best details of it were executed by sculptors born and trained there, and the finest window in the façade was carved from his design by an Irishman. The work they did together had, however, been vain. The architecture they sought to introduce was inconsistent alike with the reckless luxury, and the deforming mechanism, and the squalid misery of modern cities.

After a dissertation on fruitless struggles and the depressing disappointments of life, illustrated by the life and character of Pope, he said they had sent for him to talk to them about art. The one thing he had to tell them was, that art ought not to be talked about. The fact that there was a talk about it signified that it was ill done or could not be done. The highest works of art were the silent productions of instinct, which the possessor of it knew to be incommunicable, and the true critic of it knew to be inexplicable but through a long process of laborious years. They were all of them wild with enthusiasm about the work of Gustave Doré. If he were to tell them that that work was wholly bad—bad not by failure, but with a dreadful evil, with a harpy power of pollution, and that as long as they looked at such art as that they could have no perception of any pure or beautiful work, would they look at Gustave Doré's pictures the less on that account? Rather more, he fancied. On the other hand, he could talk to them about good works of art, but they would be none the wiser for that. Art could not, like science, be communicated in that way. Art was the instructive and necessary result of powers which could only be developed through successive generations, and which only burst to light under social conditions of equally slow growth. Whole eras of history and the passions of dead millions were summed up in the existence of a noble art. If such a noble art dwelt amongst them they should simply feel it and rejoice in it, and not care to hear lectures about it. Since it was not amongst them they had only to go back to the last place where the root and stock of it was yet alive. If they were to go back for germs of national art that had decayed, they should find a more signal example in Ireland than in any other European country. In the tenth century Ireland possessed a school of illumination which in all essential qualities was wholly unrivalled. He knew none that were equal to it for invention, finish, and refinement. The lecturer, in continuation, said he had seen much of the Irish character, and he thought the form of failure it was most liable to was this, that being generous, and wholly intending to do right, it did not attend to the external laws of right, but thought it must necessarily do right because it meant to do so; and then, when it did wrong without intending to do so, the consequences came upon it, and a sense of innocence and justice led it further astray than anything it would have been capable of doing with a good conscience. Mr. Ruskin concluded his lecture by exhorting his hearers to do useful work as a means of preparing society for the development of art. Let them strive to feed, to dress, and to lodge all those who required such aid. These were the three first arts. All the fine arts came after them. In respect of dress, he laid down that persons ought to dress so that their rank should be known; and the changes of fashion should be restricted within certain limits. It was not by parliamentary measures that they would reduce the amount of the distress that was multiplying daily; but everyone should ask himself this question, "How many persons can I feed, clothe, and put into wholesome rooms?" The elevation of the mind of the masses above that state into which their physical conditions had reduced them was also an essential preliminary to the future superstructure of art.

ARCHITECTURAL PUBLICATION SOCIETY.

THE annual general meeting of the subscribers of this society was held at No. 9 Conduit-street, on Wednesday, the 27th ult., Mr. Horace Jones in the chair. The minutes of the previous meeting having been read and confirmed, Mr. Arthur Cates, the honorary secretary, read the following report:—The past year has been devoted by the committee to the completion of the issue for the seventeenth year—1866, and the second part for that year is now in course of distribution to the subscribers. This part continues the text of the Dictionary as far as the article "Lead," the letter K being therein completed, and much progress made with the letter L, a further considerable portion of which letter is now in type. On examination of this part, it will be observed that many of the articles have extended to a considerable length, arising either from the importance of the subject or from the experience and knowledge of the writer having enabled him to give it fuller development than had at first been considered necessary.

As expressed in a paragraph of a former report, "it is the freshness of information which has placed the dictionary in its high position, and precludes all opportunity for anyone to assert that the text is a mere compilation from preceding works of a similar nature." In confirmation of the position which the committee again with pleasure confidently assert to have been attained by the work, they refer with satisfaction to letters lately received from M. Cesar Daly, the learned editor of the "Revue Generale de l'Architecture," and from M. Ernest Vinet, the librarian of the Ecole Imperiale des Beaux Arts at Paris, which satisfy them that, although the number of foreign subscribers is but few, those copies which have reached Paris have attracted well merited attention, and that the work has made for itself a reputation in highly informed and very critical circles. M. Daly announces his intention of noticing the Dictionary in the "Revue:"—"Avec tous les eloges que merite un ouvrage aussi interessant que bien fait." While M. Vinet says:—"Je tiens essentiellement à enrichir une collection que j'ai formée des plus beaux ouvrages qui se publient a l'etranger et le Dictionnaire des Architectes de Anglais est du nombre: acquerer ce remarquable ouvrage est difficile, il n'est pas dans le commerce et quand il se vend c'est à un prix très elèvé."

It had been the intention of the committee to have during the year issued a part of illustrations with text, but various obstacles prevented the realisation of this wish—not the least has been the difficulty which exists in procuring suitable drawings and sketches to form illustrations. This may arise from the fact of the student now relying much on the subjects produced by photography, rather than on the work of his own pencil, and that many of the best collections of sketches are now reserved for reproduction in the illustrated sketch-books of architectural societies. This difficulty, and the pressing engagements of the examiner of illustrations, have prevented the issue of the plates, but a series is now in preparation which will, it is hoped, shortly be ready for issue.

The completion of the letter L will enable the committee to issue a title-page and table of contents for the binding of volume four of the Dictionary, comprising the letters H, I, J, K, and L, and thus place that portion of the work in a more available form.

The committee much regret that the munificent offer of Mr. J. H. Wyatt, made in 1866, to contribute £100 towards the funds of the society has not led to the example being followed; but, however desirable it may be thus to obtain funds to hasten the progress of the Dictionary, the committee would prefer to rely on the individual exertions of the subscribers to extend the list of members, and thus increase the income at the disposal of the executive. The expenses of management are nearly the same for a small or a large income, and the addition of a number of subscribers would enable the committee to increase the quantity of matter issued in each part, and thus expedite the work.

The assistance received from the general body of subscribers (with some remarkable exceptions) does not encourage the committee to anticipate much aid in this direction, but they would observe that a proposal is now under consideration by which it is suggested that by an active and simultaneous exertion on the part of the present subscribers, which would result in the addition of one-half to their number, it would be possible so to arrange the funds which would thus be placed at the disposal of the committee as to secure the completion of the text without further call on the subscribers, whose payments for past years would probably cover all future expenses or nearly so.

Considering the prosperous state of the architectural profession, and the considerable increase made in its numbers during the last few years, this addition to the numbers of the subscribers ought to be readily obtained, and if encouraged to do so by the support of the general body of subscribers, the committee will endeavour to mature the scheme and submit it for consideration.

The audited balance sheets show a total receipt for the seventeenth year, 1866, of £432 0s. 10d., and a total expenditure of £308 7s. 8d., leaving a balance in hand of £33 13s. 2d. to be appropriated to meet outstanding liabilities for that year, while for the eighteenth year, 1867, £178 10s. has been received, and £52 2s. 10d. expended, the balance, £126 7s. 2d., being available towards the cost of the publications for that year now in hand.

In the discussion which followed, the accounts and balance sheets were subjected to close scrutiny, and the explanations afforded by the secretary having evidenced the satisfactory financial position of the society, the progress of the Dictionary and probability of its early completion were discussed, the chairman, Professor Donaldson, Messrs. C. C. Nelson, O. Hansard, T. M. Rickman, &c, taking part. The statement made by the secretary in reply to the inquiries addressed to him showed that the only element required to ensure the speedy completion of the Dictionary, was the immediate accession of a sufficient number of new subscribers to place an ample capital at the disposal of the committee. The individual interest of each subscriber was shown to be the introduction of new members, to meet whose demands the committee had available a stock of the publications of the past years, sufficient if all disposed of to supply nearly all the capital needed for the completion of the Dictionary of Architecture.

The report being thereon adopted, it was moved and carried that in order to economise the funds the printing and circulation of the report and accounts be discontinued.

Votes of thanks to the officers and chairman closed the proceedings.

It has been suggested that a subscription should be started to place a monument over the grave of Flora Macdonald. The loyalty of that noble-minded Highland maiden remains to this day unrecorded by stone or tablet.

RYDE CHURCH COMPETITION.

OUR illustrations this week comprise lithographic views of the selected, and two other of the meritorious designs submitted for the above church, a detailed notice of the competition for which appeared in the BUILDING NEWS at the close of last year.

We refer our readers to what we then said as to the relative merits of the designs, simply repeating here that the selected design by Mr. Peachey, of Darlington, the contract for which, we believe, has already been undertaken, and bears out our idea of the cost, while presenting some good points—as in the breaking-up of the tower and spire—was not, in our opinion, entitled to carry the palm of success either in plan or general design. The plan we deemed too long and scattered in its main adjuncts, the transepts too long and disjointed for effective hearing, and, we may add, for compact aggroupment and unity of composition. We hope the seating eastwards of the officiating desks will be confined solely to the use of the choir, and not, as we inferred at the time of our review, for a portion of the congregation. The dying-away of the nave, clerestory, and parapet against the roofs of transepts is defective, and the ridges of the latter being so much lower than the nave ridge is certainly faulty. The view we give of it will speak for itself that we did not overstate these objections of this design. Whatever merits of detail belong to this design, and the proportion of west end of nave and aisles is one, we cannot say that its author has in this case been so successful as in other of his works. There is a redundancy of pinnacles and other useless post-Gothic accessories that reminds us of that mock Gothic air so prevalent when the Gothic revival was in its infancy.

The other exterior design we give (by Messrs. Driver and Payne) shows a very dissimilar treatment, characterised by a strong continental touch and a severe verticality of outline, that contrasts rather piquantly with the effect of studied prettiness in Mr. Peachey's design—a class of effect, be it observed, infinitely more inviting and pleasing to the popular taste, and perhaps to this the accepted design owed its success. We much prefer, however, the stately simplicity of the rejected design, both in plan and general composition. The tower is nicely positioned, uniting and concentrating the masses, and serving usefully as a valuable adjunct internally. Finished with a circular apse, lighted by lofty lancets, the whole effect is pleasing; but the tower, terminated by a well-designed composition, is rather overwrought for its severely plain substructure, a fault of the school.

Our one page interior view is an accurate and faithful rendering of a design that bore unmistakable evidence of high artistic ability, though, we would say, rather misdirected for a parish church. Incomparably the most effectively tinted monochrome drawing exhibited in the competition, there are some good features in Mr. Conybeare's design that cannot be overlooked, in spite of the particular type of Romanesque he has adopted. It is a style indeed that deserves development, as suggestive of noble treatment. The nave and tower piers are simple and effective, and so are the clerestory and triforia. The proportions throughout, the management of the central lantern, with its cellular groining, the apse, with the lateral arrangement of baptistery and choir, are highly pleasing, but the design we think rather too pretentious for the purpose and outlay contemplated.

The thirty-eighth meeting of the British Association for the Advancement of Science is fixed for the week commencing Wednesday, August 19, at Norwich. Mr. Joseph Dalton Hooker, D.C.L., Curator of the Royal Gardens at Kew, will preside.

KILLED IN THE STREETS.

A CORRESPONDENT in another column calls attention to an evil which is increasing, and which, unless it is checked, is destined to increase in London and other large cities. Though London is rapidly increasing, the streets of the city do not and cannot get proportionally widened. The result is, traffic increases without enjoying a corresponding increase in elbow room. Besides, as our correspondent says, everything must be done rapidly. Almost everybody seems to have more than enough to do, and he drives on with something like railway speed. The old saying of "Everyone for himself and the devil take the hindmost," was never more applicable than now. Men not only pursue their avocations in a hurry, but they are not particular on whose corns they tread or who loses so long as *they* win. This spirit has penetrated the cabdriver as thoroughly as any other class in the community. He likes a good "fare," and for an extra sixpence or shilling he will dash his way through streets and around corners, and if by chance he should knock some luckless old fogey into the gutter, he will dash away all the more rapidly to escape if possible the consequences. The number of people who are wounded and killed in this way every year in London is almost incredible. If a man commits suicide, or if a house falls and kills a baby, an inquest is held on the dead body, and the event is chronicled in the papers. But let a man be killed in the street, so frequent is the occurrence that very frequently an inquest is held, and the outside world is none the wiser. If the ice in Regent's Park give way, and cause the drowning at one time of forty persons, there is not only a searching inquiry before a coroner, but there is a great social commotion, the newspapers, day after day, have leading articles on the matter, hundreds of thousands flock to the scene of the accident, and Government takes measures to prevent such calamities in future. But every year there are more persons killed in the streets of London than perished by the breaking of the ice the winter before last in Regent's Park; and there is but little doubt that if street traffic were subjected to police control, many of these accidents would be prevented. We believe, with Mr. Bedford, the coroner for Westminster, that some wholesome regulation ought to be made at once to prevent rapid driving through the streets, and particularly at points where streets or passages intersect each other. Cabs and carriages ought not to be allowed to drive beyond a certain pace in a given space of time, and then drivers would have more command over their horses, people would have more time to get out of the way, and fewer lives would be lost. Another way to abate the evil would be to hang a cabman.

VILLA AND COTTAGE ARCHITECTURE.*

WE have received another instalment of this interesting publication, which in many respects differs from any other. Instead of being a series of fancy designs which have not stood the test of thorough examination, this work gives representations of buildings that have been erected, with the actual cost fairly set forth under headings. The architects who contribute are for the most part well known in the profession, and, although the works are by no means of equal merit, they may all be studied with advantage. Amongst the architects who have contributed will be found the names of Messrs. Ayliffe, of Manchester, Messrs. Banks and Barry, Mr. Christian, Mr. Darbishire, Mr. E. B. Lamb, Mr. Kendall, Messrs. Speakman and Charlesworth, Mr. Truefitt, Mr. Walters, and others. The introductory notice explains the object of the work, which is to give "detailed illustrations of modern buildings, serviceable as models in future architecture," and especially the work is devoted to buildings of "moderate dimensions, or erected at a cost (ascertained in nearly every one of the cases) ranging from £500 to £2,500, with more expensive exceptions." The value of the publication, therefore, lies in its positive as distinguished from a speculative character. It is true that most of the designs are capable of improvement, but it is something to know that the house we are looking at was actually erected for a certain sum. Messrs. Banks and Barry contribute drawings of a villa at Sydenham; Mr. E. B. Lamb makes public a farmhouse of most domestic character; Mr. Walters, of Manchester, shows what may be done with a double villa; and the Messrs. Thomson, of Glasgow, are not chary of pure Greek design in the latitude of Renfrewshire. Details are moreover given to a good scale, and there is nothing sketchy or indefinite to be found throughout the publication. The designs are not perfect; some are very objectionable, but they are all living representations of actual buildings. As an example of what may be done at a moderate cost, the "Sycamores," by Messrs. Paull and Ayliffe, of Manchester, may be quoted, where everything is done thoroughly for £3,600. It is always unpleasant to find fault, but we cannot refrain from remarking that a certain cottage at Govan, Renfrewshire, by Mr. Rochead, is unworthy of a place in this publication, and that an exaggerated feeling for Grecian art seems to maintain a strong hold on the architects whose lines are cast in the pleasant places north of the Tweed. It has always struck us that the ancient architecture of Scotland was most distinct and characteristic, and we cannot but look with regret on the transplanting of pure Grecian art to a soil to which it is not congenial, and to a people to whom it cannot be pleasing. The blemishes which attach themselves to this work are, however, trifling in comparison to its merits. It deals neither with palaces nor model cottages, but it gives illustrations of middle class houses, with the ascertained cost.

* "Villa and Cottage Architecture." By various authors. London: Blackie and Son.

NEW ZEALAND.

IN February last a correspondent wrote asking, through "Intercommunication," for information respecting the building materials of New Zealand. He was answered by a Mr. R. H. Drew, who offered on his making an appointment to give him what information he possessed. So many of our subscribers, however, desirous of the information, wrote to him that he found it impossible to reply to their letters, and therefore determined to publish a small pamphlet on the subject, of which we have received a copy. His idea is to afford reliable information as to the colony, especially to intending colonists. Many people inseparably connect the Maori tribe with New Zealand, others look on all the islands alike as purely pastoral districts. Of the three large islands the north is the only one at all troubled by hostile Maoris; in the others they are on the most friendly terms with the colonists. Stewart's Island is especially rich in timber, admirably adapted for building purposes, and many choice kinds suitable for cabinet work. The mineral wealth in the southern island is unbounded. Coal of superior quality, serpentine, granite, marble of fine grain, and in quantity sufficient, as the author assures us, "to build twenty thousand Jernsalems," are found there. Many of these, coal especially, are being at present imported into the colony at ruinous prices, sufficient capital not being available to work the treasures it possesses. Government aid seems by no means wanting to afford investors the advantage of an indefeasible title on most advantageous terms. The author, himself a colonist of fourteen years' experience, is enthusiastic in his praise of the islands, and has, we think, done his best to invite attention to the beautiful land which he has adopted as his home.

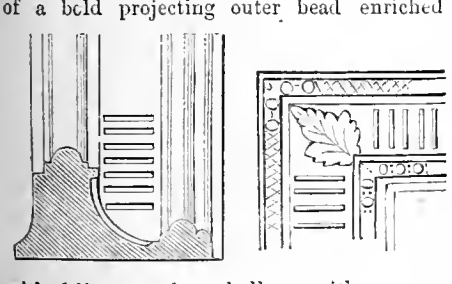
PICTURE FRAMES AT THE ROYAL ACADEMY.

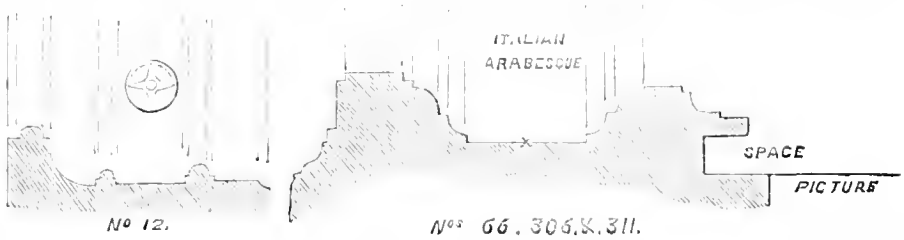
IT is certain that considerable improvement has been made of late years in the design of picture frames. The gradual diffusion of a knowledge of the principles of art among the educated classes, and the influence of teaching in our schools of design upon our designers and artisans, have tended very materially to check the redundancy of ornament and inartistic forms which twenty years ago were looked upon as triumphs of taste and ingenuity. A glance at some of the frames in the present series of the National Portrait Collection at South Kensington will be sufficient to demonstrate the sensible progress that has been attained since the commencement of the century, some of the largest and most notable of the pictures there being the most conspicuous for the utter want of taste and propriety in the frames, while one can hardly look into a third or fourth rate printseller's without seeing some evidence of design and carefulness in this particular, or at least a recognition of the necessity of some harmony between the picture and the frame enclosing it. There is no doubt room for still further improvement, the greatest desideratum being the substitution of architectural forms and definite proportions for the cabinetmakers' mouldings and the ill-regulated, purposeless divisions which disfigure the majority of modern frames, and proper subordination of treatment generally. It should be borne in mind that the frame is after all only an accessory, and if it attracts attention away from the picture which it is designed to embellish it fails in its object, no matter how good it may be in itself.

Considering the prices that are now paid to artists and the influence of a handsome, well-designed frame upon the value of a picture, we might naturally expect to find at the Royal Academy the best specimens of frames that money and taste combined could produce; but whether it be that the restrictions of the academicians discourage artists from attempting any novelty, or whether they find that a picture in a bad frame sells as well as a picture in a good one, it is certain that we must not look to the annual *salon* in Trafalgar-square for any examples of originality or taste in the arts of picture framing.

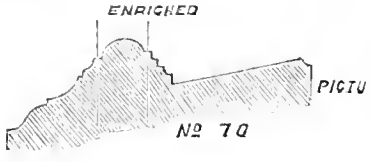
There is a painful uniformity of pattern in the frames at the present exhibition at the Royal Academy, which leads one to suppose that they all come from the same maker, or rather (which is the more probable supposition) that artists trouble themselves but little about the framing of their pictures and leave this important matter to the taste of the frame-maker, who supplies what he considers the most appropriate to the occasion, being guided in his choice by the number of that description he has sold, or its popularity among artists. The general form consists of a bold projecting outer bead enriched



with foliage, a deep hollow with narrow sinkings, then another but smaller enriched bead, and a narrow plain face with a burnished bevelled edge next the picture. Nearly three-fourths of the frames at the Royal Academy are of this type, varied occasionally in detail, but the general form remaining the same. The design is not precisely bad, although the whole of the surfaces being enriched gives the frame a heavy appearance; but its continued repetition up and down the walls is monotonous and distressing. Mr. Herbert, an artist of undoubted taste and originality, has got this popular frame, and Baron Leys has been apparently induced to go to the same establishment, his frame being almost identical with Mr. Herbert's, and is a most ludicrous contrast in its newness and conventionality to the Belgian painter's gloomy and unconventional picture. The same frame enshrines the portrait of Eneas Macdonnell (No. 51) in the east room, a piece of rampant national egotism, and these three examples fairly illustrate the absurdities of modern picture framing. Mr. Millais's frames (No. 12) are all commonplace, and it is evident he has not bestowed a thought upon them. Mr. Richmond's portraits (Nos. 66, 306, and 311



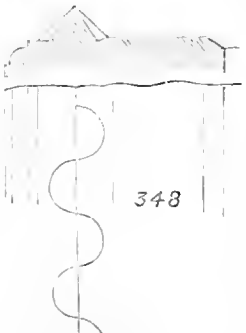
have frames of similar design, apparently from an Italian model, the mouldings being better drawn and more accentuated than in English work, but the Cinque Cento panels, although well designed, are much too overpowering. The frame to Mr. Millais's picture of Rosalind and Celia (No. 70), although commendable for



the sparing manner the enrichments are applied, is bad in form and not sufficiently important for the size of the canvas.

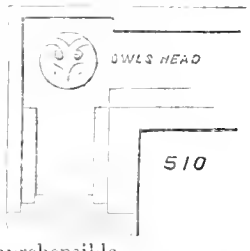
The two large paintings of Hamlet and Ophelia, by Signor Rapisardi (Nos. 93 and 151), which are most unduly prominent in the east room, serve as an example of an error in the opposite direction of most of the English frames. Here the mouldings are simple and much more architectural than the forms popular with us, but the good effect is destroyed by overlaying the angles with heavy and unmeaning foliage which extends half-way across the frame on each side.

To Mr. Ward, perhaps, belongs the bad pre-eminence of having the ugliest and most offensive frame in the Exhibition. Nothing can be in worse taste than the frame of his picture of the Royal Marriage 1477 (No. 150). The constant contemplation of Mr. Edward Barry's Gothic in the course of the painter's journeys to and from the Houses of Parliament, can alone explain the remarkable corruption of taste the selection of this frame reveals. Mrs. Ward has the same design for her picture of Lady Jane Grey, at Sion House, and it is worth remark that while one of these paintings represents an event that took place in 1477, and the other in 1553, the same frame is considered equally appropriate to the two. Mr. Cathelinaus' frame (No. 176) is in the ornate Florentine style, good in itself, but too gay for the tone of the picture, which is grey and subdued. Mr. Poole has used the same frame



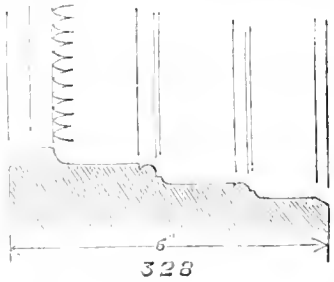
with some little variation for his two remarkable works (Nos. 188 and 382); the subject and treatment are, it is true, something alike, but it would have been well to have had a little more individuality.

The frame of Mr. Lucy's ambitious picture of the abdication of Mary Queen of Scots (No. 348) is noticeable for its novelty, but is not successful, partly on account of the unarchitectural character of its profile, and also its inadequacy to the size and importance of the painting. No. 248, a portrait of Earl Somers, by Sir Charles Lindsay, is also remarkable as a very vulgar picture in a very vulgar frame. The frame of Mr. A. Hughes's picture (No. 510) is not ungraceful, but it is as difficult to make out what relation it has to the picture as it is to perceive what connection there is between the picture and the verses in the catalogue. The incised hearts on the upper part may possibly be explained, but the owls' heads at the angles are



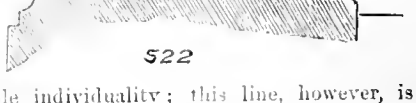
quite incomprehensible.

Mr. Leighton has a liking for a strange nondescript frame, a compound of Gothic and Greek forms. The frame of his Ariadne (No. 328) is composed of a series of slightly

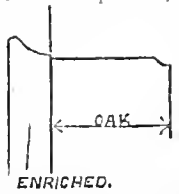


receding surfaces united by beads with a lancet-shaped ornament on the outer edge.

His Actæa (No. 522) has a nearly similar frame with a black line introduced to give a



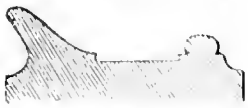
little individuality; this line, however, is much too strong, and its crudity destroys the delicate simplicity of the picture. Miss Starr has used this same frame, with some little modification, for her very clever picture of "David and Saul" (No. 509). In Mr. Leighton's other picture, "Acme and Septimius," an attempt has been made to give a rustic character to the frame by enriching one of the beads with fruits and foliage, but it is not satisfactorily carried out.



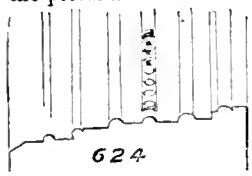
The good effect of gilding on wainscot, by which the monotonous colour of ordinary gild-

ing is relieved by the grain showing through, is now well known, but we only find a few of the younger artists employing it, Mr. Poynte being among the number. It is true that Mr. Thorburn uses wainscot to his uninteresting picture, "Forecasting" (No. 525), but it cannot be cited as a successful application, the effect being bald and commonplace to the extreme. Mr. Maclise, on the other hand, falls into the opposite mistake, the frame of his picture (No. 439) being as crowded as his canvas with useless and unmeaning accessories.

Mr. Walker's "Vagrants" has the frame,

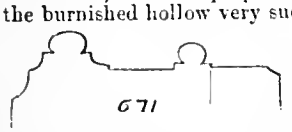


which is otherwise satisfactory, although coarse in execution, disfigured by the space between the mouldings (which ought to be left plain) being stippled over with large ill-drawn foliage of a Gothic character. Mr. H. T. Well's "Portrait of Panizzi," although very much larger in point of scale, has the same pattern of frame, omitting the foliage. Miss Sandy's small frame to her "Head of Enid" (No. 571) is nicely designed as to profile, but is spoiled by the pateras, which are too large for the picture.



Mr. Albert Moore's delicate and original "Azaleas" (No. 624) is one of the few pictures in the Academy that has a frame that fits the picture. The forms employed are simple and well known, but are so judiciously employed that they have all the charm of novelty, the ornament has a proper proportion to the plain face, and the result is a frame in perfect harmony, both in form as well as in feeling, with the painting it holds. It is purely Greek in conception, and is a most graceful and pleasant design.

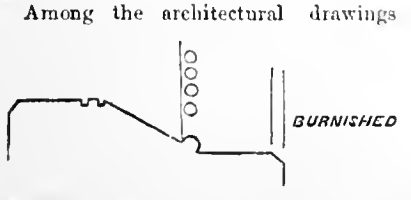
The frame of Mr. Tourrier's "Cloisters" (No. 656), although very simple in its elements, is noticeable for its good effect; the Moresque ornament is perhaps a trifle overdone, and is certainly inappropriate to the subject, which is Gothic, and very good Gothic too, but the proportion is good, and the burnished hollow very successful.



Mr. Brennan's frame (No. 671) is good in design, and is worthy of the picture, which is in every way a very remarkable one, and has not been noticed as it ought. The frame is evidently Italian, from the simplicity of the mouldings, and was not, it would seem, made for the picture, which is some inches too short for it, the space being filled with a wider margin on the left-hand side.

In the miniature, architectural, and generally incapable room, there is little to remark; the frame to the portrait No. 791 is, however, conspicuous from its resemblance to a Gothic monumental tablet, and the portrait of the Countess Dudley and Ward (No. 788) shows how it is possible to neutralise a good portrait by a well-designed but inappropriate mount.

Among the architectural drawings we



would call attention to the vulgarity of Mr. C. Barry's frame to his design for Alleyne's College, the shabbiness of Mr. M. D. Wyatt's frame for his Courtyard of the India Office, and the effective simplicity of Mr. T. H. Watson's frame for his perspective view of his design for the London Orphan Asylum.

J. M.

LEGISLATION AND PUBLIC HEALTH.

WITHIN the few years last past many Acts of Parliament have been passed with a view to the promotion of the health of the people. There is, in fact, a growing disposition on the part of many persons to look to Parliament for a solution of many of the difficulties which surround the question. Before they agitate for additional legislation it is well that they should survey what has been already done. It is quite evident that many acts are dead letters as far as many districts, not only in the metropolis, but in most of the large towns, are concerned. Perhaps there was no district in England which stood more in need of legislation on sanitary matters than that of Whitechapel. But, strange to say, the Board of Health of that district have used but very sparingly the powers which legislation has placed within their reach. We have no hesitation in saying that it would be pretty much the same with Mr. Torrens' bill, provided it became law. In his last quarterly report the medical officer of health of the Whitechapel district says that, "Within the last few years several Acts of Parliament relating to public health have been passed which, with the exception of the Sanitary Act of 1866, have not hitherto engaged much of the attention of our Board. These acts are, first, Adulteration of Food or Drink; second, the Labouring Classes Lodging Houses' Act, 1851; third, an Act to enable the Public Works' Loan Commissioners to make Advances towards the Erection of Dwellings for the Labouring Classes, 1866; fourth, an Act to amend the Labouring Classes Dwellings' Act, 1867; and fifth, the Workshops' Regulation Act, 1867. The Adulteration of Food or Drink Act gives power to the vestries and district boards to appoint analysts. The fourth section of this act empowers purchasers of articles of food or drink to have them analysed by the analyst appointed by the Board, on payment to the analyst of a sum of not less than 2s. 6d, nor more than 10s. 6d. The fifth section gives power to justices to have articles of food and drink analysed by any skilled person, as they may appoint, for that purpose. The three acts relating to the erection of dwellings for the labouring classes, 1851, 1866 and 1867, may be read as one act. The provisions of these acts enable local boards to borrow money from the Public Works' Loan Commissioners, for the purpose of assisting local boards in the purchase of land and buildings, or in the erection, alteration, and adaptation of buildings, to be used as dwellings for the labouring classes, and in providing all conveniences which may be deemed proper in connection with such dwellings. The Lands' Clauses Consolidation Act, 1845, and any act amending the same, except the clauses with respect to the purchase and taking of land, otherwise than by agreement, are incorporated with these acts." Mr. Liddle goes on to say that the Workshops' Regulation Acts will entail a considerable amount of additional labour and responsibility on the Board. The duties of the inspectors will be to inspect the means provided for ventilation in workshops not specified in the Factory Acts' Extension Act, where a less number than fifty persons are employed, and to see that the nineteenth section of the Sanitary Act of 1866 is observed, which provides for the keeping of such workshops in a cleanly state, and for their ventilation in such a manner as to render harmless as far as practicable any gases, vapours, dust, or other impurities generated in the course of the work carried on therein that are a nuisance, or injurious or dangerous to health. A perusal of this part of the report shows that it is easier to get Acts of Parliament passed than to embody their spirit in practical action.

SANITARY CONDITION OF WHITECHAPEL.

THE last quarterly report of Mr. Liddle, Medical Officer of Health for the Whitechapel district, shows that persistent efforts have been made by the inspectors, and that sanitary matters there wear an improved aspect. Though the medical officers of the union have attended 4,498 new cases of disease among the pauper population, not a single case of cholera has been returned during the last quarter. As an instance of indifference of large trade proprietors to the public health, we quote the following from Mr. Liddle's report. He says:—

It is with a feeling of much regret that I have regularly every quarter to bring under your notice the nuisance from the refinery premises of Sir Anthony Rothschild. Complaints still continue to be made of the deleterious effects of this nuisance, and I can bear personal testimony to the truth of these complaints. When the Board has interfered in the matter, assurances have been given by Sir Anthony Rothschild and his agents, to the effect that, when the several alterations in the construction of the works were completed, the nuisance would be got rid of entirely. The last promise made to the Board was to the effect that, as the premises were then being enlarged, effective measures could and would be taken to collect the heated acid vapours and condense them, whereby the neighbourhood would be entirely relieved from their noxious influence. The premises have been enlarged, but the nuisance continues to be as bad as ever.

It is too evident that Sir Anthony Rothschild will not abate the nuisance until he is compelled, and the sooner compulsion is used for the health of the district the better.

We find that during the quarter 8,820 houses have been inspected, and 667 houses have been "systematically visited to ascertain their cubic capacity," that 120 drains in houses have been improved, that 225 drains have been cleansed or repaired, that 101 water butts have been provided or repaired. We also find that 67 water waste preventors have been erected in the district.

From the last paragraph in the report, it appears that the Board contemplate reducing the number of inspectors. Mr. Liddle very properly deprecates such a step, and we sincerely hope that, for the sake of Whitechapel in particular, and London in general, such will not be done.

SCHOOL OF ART.

ON Wednesday week a large number of the supporters of the Nottingham School of Art met to hear the announcement of the result of the March examinations. Special attention was drawn by Mr. R. Birkin, who presided, to the large increase for the year 1868 of the number of students passing the examination creditably, and those obtaining prizes, and he congratulated Mr. Rawle, the able head master, on the progress made. A long list of awards of prizes and certificates was then read by the Secretary. The chairman stated that Mr. Rawle had obtained by means of voluntary contributions a fund for providing "vacation prizes," to be competed for by the students, and he trusted there would be a spirited competition. Mr. Rawle, who then addressed the meeting, pointedly referred to this new feature in the institution. He urged upon the students the necessity of thorough, honest work in their studies, and spoke at some length on the value of technical education. To the great bulk of Nottingham artisans, engaged as they were in the lace trade, a knowledge of ornamental and mechanical drawing was of the greatest service. There was now no excuse for an artisan not possessing a knowledge of drawing. By a recent minute of the Department of Science and Art artisans could obtain their education at the institution free of charge. Government also encouraged talented students, and gave them scholarships valued at £52 and £104 per annum for two years, with the privilege of working among the art treasures of South Kensington. He had hoped to have given the meeting some particulars concerning the national medal competition; but he had learned that the contest would not be decided till some time next month, when he hoped some of the golden apples would have fallen to the share of the institution. A vote of thanks to the chairman closed the proceedings.

ARCHÆOLOGY.

THE Rev. Canon Greenwell, of Durham, who has made such extensive investigations in the Yorkshire tumuli, has commenced a series of Suffolk diggings near Ingham, Bury St. Edmunds, the results of which will be made public on completion of the work. On Thursday week, the Suffolk Archæological Association met on the ground. So far, only burnt burials have been met with.

An interesting addition has lately been made to the Pompeiian Court of the Crystal Palace, consisting of specimens of the volcanic ash and scoriæ by which the city of Pompeii was overwhelmed, as well as of some of the objects discovered in the ruins. For these the company are indebted to

Signor Fiorelli, the able and indefatigable director-general of the Museo Borbonico, at Naples, who is also director-general of the excavations. A good map of the city as well as of some of the most interesting spots has also been put up in the court.

PARLIAMENTARY NOTES.

On Thursday week, in answer to a question by Lord Eustace Cecil as to what step he intended to take with respect to the memorial recently presented by the inhabitants of Barking to restrain the Board of Works from discharging the sewage of London into the Thames, Mr. Gathorne Hardy said the Act of Parliament under which the sewage was discharged into the Thames was under consideration.

The Metropolis Subway Bill passed through committee in the House of Lords on Friday last. On the same evening the following peers were named as the select committee on the Artisans' and Labourers' Dwellings' Bill:—The Earl of Malmesbury, the Duke of Somerset, the Duke of Beaufort, the Earl of Derby, the Earl of Shaftesbury, the Earl of Carnarvon, the Earl Cardigan, the Earl of Kimberley, the Bishop of London, the Duke of Argyll, Lord Foley, Lord Portman, Lord Chelmsford, Lord Westbury, Lord Athulmney, and Lord Penrhyn.

Building Intelligence.

CHURCHES AND CHAPELS.

Several new churches are now in course of completion in the metropolis. A new church, with parsonage house and schools in connection with it, is in course of erection in Somers Town, an outlying and destitute district of the parish of St. Pancras. The cost will be nearly £1,000. A new church has nearly been completed on the old City burial ground, Golden-lane, one of the most destitute districts in the metropolis. It is designed for the parish of St. Mary Charterhouse. At present the works are stopped for want of funds, only £300 being required to complete the church. A site for a new church in the Isle of Dogs has been given by Lady Mary Charteris; and the Marquis of Northampton has given a freehold site for a church in the district of St. Peter's, Clerkenwell. In the new district of St. Mark's, Bethnal Green, a new church will be commenced as soon as circumstances will admit.

The foundation stone of a new church at Newtown, dedicated to the memory of King Charles "the martyr," was laid on the 22nd ult. It is in the Early English style, and will consist of a nave 51ft. long by 24ft. 6in. wide inside, a chancel 26ft. 6in. by 17ft., a vestry, and south porch, and will afford accommodation for about 220 persons in open seats. The material used for the walls and dressings to windows, &c., is Grinshill stone. The roof will be open-timbered and covered with Staffordshire tile. The cost is estimated at £1,170. The work is being carried out from the designs of Mr. E. Haycock, junior, architect, Shrewsbury, by Messrs. Nevett Brothers, of Ironbridge.

A new convent chapel at Skibbereen has just been dedicated. The style is Early Decorated. The church is faced externally with Bath stone. The cost of the building was £1,500. Messrs. Pugin and Ashlin, of Dublin, were the architects, and Mr. W. Murphy, of Bantry, the builder.

A new R. C. Church, dedicated to the Sacred Heart, was consecrated on the 24th ult. The style is Early Decorated, and the plan comprises nave, aisles, south porch, and sacristy. The internal dimensions are 110ft. long by 44ft. wide. The walls are of local limestone, with white stone dressings. The cost of the church was £3,500. Messrs. Pugin and Ashlin were the architects, and Mr. James Scanlan the contractor.

On Friday, the foundation stone of a new Wesleyan Chapel was laid at Rugby. The style chosen is Early Pointed, and the building will seat 700. Mr. C. O. Ellison, of Liverpool, is the architect, and Messrs. Parnell and Sons, of Rugby, the builders.

The foundation stone of a new Methodist Chapel especially for the labouring classes was laid on Tuesday at Leeds. The design is Gothic, and the plan consists of nave and aisles. It will seat nearly 500 persons, at a cost of about £2,000.

The foundation stone of a new Congregational Chapel and School was laid at Ilkley, near Bradford, on Monday last. The style is Decorated. The interior dimensions are 64ft. by 42ft., and accommodation will be provided for 450 persons, at a cost, including the school, of £5,000. Mr. J. Pritchett, of Darlington, is the architect.

The memorial stone of a new Wesleyan Chapel about to be erected at Great Barr, near Wednesbury, was laid on Monday week. Its style is Early Gothic, the materials to be used in its construction being limestone, with Bath stone dressings; and its cost, including the site, is estimated at £1,500. The architects are Messrs. Loxton Brothers, Wednesbury, and the builder is Mr. Crutchley, Wolverhampton.

The restoration of Bath Abbey has been advanced another stage. We hope in the course of a few months to be able to announce the completion of the stone groining in the nave and aisles; three bays in the nave are now exposed to view. The committee have given the contractor instructions to proceed with the last bay; the men are now busily engaged upon it, and this, the most important part of the restoration, will be finished by the end of September. About £1,300, however, is still needed to make up the sum required to complete the work.

The new Tyndall Baptist Chapel, Bristol, will shortly be opened for Divine worship. The design is Decorated Gothic. The elevations are faced with Pennant stone in random range courses, tuck pointed. The roof is covered with Bangor slate, alternating in plain and ornamental courses. The contractors are Messrs. Marquiss and Munro, of Bristol. The total outlay on the chapel and its fittings will be about £6,500. The designs are by Mr. S. Hancorn, of Newport and Bristol.

At the last monthly meeting of the Society for Promoting Christian Knowledge, the chief discussion arose on the motion of the Rev. R. T. West, to grant £4,250 towards the building of churches, schools, and houses in the Natal diocese, for the use of the clergy and laity who repudiate the authority of Bishop Colenso. Mr. West's motion, after a stormy discussion, was lost by a small majority.

BUILDINGS.

A new Congregational School was opened at Leamington last week. The building is in the Gothic style, harmonising with that of the chapel. The two rooms are 45ft. by 30ft., and have separate entrances for boys and girls. The entire cost is about £900. The architect is Hy. Fuller, London; the contractor, Mr. F. A. Woolison.

The memorial stone of the school-room and dining-hall, and the first stones of the two "testimonial houses" in connection with Mr. Spurgeon's Orphanage, at Stockwell, were laid on Monday last. The foundations of four additional houses have been laid, and these, with the houses the stones of which were laid recently, will conclude all the building operations at present contemplated. Already there has been subscribed a sum of £9,000, and it is estimated that to finish and furnish the whole of the buildings a sum of £5,200 more will be required.

The rebuilding of Her Majesty's Theatre has commenced under the superintendence of Mr. Lee, architect, the contractors being Messrs. Trollope and Sons. By the terms of their contract they are to have the house ready in forty weeks from the present time, or to pay a forfeit of £1,000 a week for every week they go over that period. The old lines of the building will be preserved, as they could hardly be improved; but the *bijou* theatre will not be replaced. The seating capacity of the old house was under 1,700 seats; this will be increased in the new house.

On Wednesday the Princess Mary of Cambridge, accompanied by Prince Teck, opened the new wing of the National Orphan Home at Ham. The new wing, which is the result of an appeal made to the subscribers to the *Quiver*, will accommodate twenty-five additional girls, and also contains an infirmary ward. It is very plainly, but substantially built.

On Tuesday the foundation stone of a new wing of the Convalescent Home, Coatham, was laid. The home is in the Gothic style of architecture, and accommodates fifty patients. The new wing will make room for other fifty patients, and will be erected at a cost of about £1,700. Mr. Wm. Clephan, of Stockton, is the architect, and Mr. Kidd, of Saltburn, contractor.

On Tuesday last, the foundation stone of a new "Workmen's Hall" was laid at Monkwearmouth. The building is of plain brick, and will afford to 1,000 persons the advantages of a working man's club, library, &c.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—C. F. H.—T. G.—F. W. R.—C. B. A.—C. J. P.—C. B. A.—J. A. H.—J. W. and C.—A. M.—E. W. G.—R. G.—I. H.—I. A.

Correspondence.

MR. MOORE'S DECORATIONS.

To the Editor of the BUILDING NEWS.

SIR,—I wish to make a statement for the information of your correspondent "A. Z," and any others who may be interested in the subject on which he writes, and shall feel much obliged if you will kindly afford me a little space. The drawings for the interior decorations of the Queen's Theatre, now in the Architectural Exhibition, were originally prepared under my immediate direction, but since they left my hands last autumn they have been altered so much that they cannot now be correctly described as mine or as suggested by me. In the drawings of the ceiling, the squares and the outer belt of the fan-shaped part have been entirely changed. And in the other drawing, although no light and shade is used elsewhere, the backs of the boxes have been shaded so as quite to obliterate the colour originally placed there, and, not least, the seat covers have been changed to a colour that necessarily destroys the whole scheme. I have been so little consulted with respect to these alterations that I was not even aware of their existence till I saw the drawings the other day at the exhibition.—I am, &c., A. MOORE.

17, Fitzroy-street, Fitzroy-square, June 3.

SIR,—Your correspondent, "A. Z.," in last week's number, is evidently not aware that the scheme for decorating the Queen's Theatre, as "suggested by Mr. Albert Moore," has been subjected to a number of alterations. The "general tone of colour" upon that drawing is certainly not as it left Mr. Moore. I myself (and I have no doubt others would confirm me) can testify to the fact that the ceiling has been changed, purple shadows have been put into the box spaces, thereby obliterating the gentle tones of grey that were there. The whole of the seats of dress circle and upper boxes, that were painted a delicate flesh colour, are now an overpowering red, and on looking closely at the drawing it appears to have been rent and patched by some clumsy hand. The result of this is that the colour is more or less damaged, which being body colour, depends so much for its purity on careful preservation. It is rather unfortunate that "A. Z.," appreciating Mr. Moore's work as he professes to, should arrive at a conclusion so much against that artist, rather than believe in that impertinent treatment of artists which is unfortunately too possible.—I am, &c., A PAINTER IN WATERCOLOURS.

THE VENTILATION OF CELLARS.

SIR,—I have, in my business as a brewer, often observed that the construction of cellars is one of the greatest of our popular errors.

In cases where my customers have complained of their ale turning sour, I have invariably found a remedy by ventilating the cellar with a few inch holes perforated in the door and a brick or two withdrawn in the wall opposite, or by any other means, so that a current of air is obtained. It must follow that if the air in the cellar be impure it will enter the cask when in draught,—*i.e.*, as the cask is being gradually emptied of its con-

tents air fills up the vacant space, and if such air be impure it will have a decidedly injurious effect on the beer; of course, I premise that the ale is sound when supplied by the brewer.

Considering that the above information would be useful to the public, especially throughout the summer months, I trust you may not deem it out of place to insert it in your columns.—I am, &c.,

June 1. XXX.

STREET ACCIDENTS.

SIR,—There is an evil which has been increasing for a long time past, is increasing daily now, and ought to be diminished. The evil I allude to is furious driving in the streets. Everybody in London appears to be in a hurry. I am not about to inquire into the causes of this state of things; but it is a fact, and one of the results is that carriages, cabs and hansom cabs in particular, run through the streets like Jehu of old. Many a man when he gets into a hansom cab is not very particular who is put to inconvenience as long as he gets to his destination quickly. And hansom cab-drivers, who are not always the politest or most scrupulous of men, are too eager to get a good fare to study the safety of foot passengers. The consequence is that people are frequently knocked down and killed. I believe that not one-tithe of the accidents which happen in the streets get recorded in the newspapers. Now the question is how is this growing evil to be resisted? I believe that Mr. Bedford, when holding an inquest last week on a man who had died from the effect of being knocked down in Cranbourne-street, hit the right nail on the head when he said that the time was come when driving in London should be put under definite legislative control. As a rule, I am not favourable to governmental interference in such matters. But when men will persist in rapid and reckless driving, apparently careless of the consequences, the only thing to be done is to speak to their fears. Let them know that if they drive (say) faster than six miles an hour, they will be fined. I am sorry to say that it appears to me that the only effectual way to appeal to "cabby's" heart and judgment is through his breeches' pocket.—I am, &c.,

A MAN IN THE STREETS.

EDMONTON VESTRY HALL COMPETITION.

SIR,—I submitted a set of designs for the proposed new vestry-hall at Edmonton, and have received a communication, of which I enclose a copy, in hopes some of your readers can interpret the first paragraph thereof, as I am utterly unable even to guess the meaning of it.—I am, &c.,

A COMPETITOR.

[COPY.]

Vestry Clerk's Office, Edmonton, N.,
30th May, 1868.

Vestry Hall.

DEAR SIR,—The opponents to the object at a Vestry Meeting on Thursday last were successful in defeating it. Your design and plans were not amongst those selected, and I will forward them to you on Monday next.—I am, yours truly,

(Signed) WM. PULLEY, Vestry Clerk.

Intercommunication.

QUESTIONS.

[823.]—REYNOLDS'S "LAUGHING GIRL."—Can any of your readers inform me where the original picture of the "Laughing Girl," by Sir Joshua Reynolds, is to be found, and if it can be seen, &c.?—W. R.

[824.]—WATER WASTE PREVENTORS.—I see from the last report of the Medical Officer of Health for the Whitechapel District that there are at the present time 67 Water-waste Preventors in operation in the district. I should feel obliged if some one would give a description of the apparatus.—INVENTOR.

[825.]—LEGISLATION AND PUBLIC HEALTH.—Will you, or some one, inform me of the Acts of Parliament which have been passed during the last few years relating to public health?—INSPECTOR.

[826.]—DOLOMITE.—I lately saw that dolomite was spoken of as a superior building material, as it is capable of a beautiful polished surface. I want such a thing, and should be glad to know more of the material, and how I can get it. Some one who knows more of it will perhaps be good enough to tell me.—EXPERIMENT.

[827.]—NORWEGIAN COOKING STOVES.—I should be thankful if anyone would supply me, through Intercommunication, with information respecting these stoves. I want to know whether they can be seen in London. If not, I should like to know on what principle they are constructed.—R. GREY.

[828.]—MR. TORRENS' BILL.—The BUILDING NEWS has several times offered observations on Mr. Torrens' Bill, but I do not remember it has at any time given a *resume* or abstract of the bill itself. As I and many others, as a matter of course, are interested in the matter, I should like a little information thereon.—W. COOK, Norwich.

[The following may be taken as an abstract of the bill:—Reports are to be made from time to time by the health officer of each district, as to any dwellings in a state or situation dangerous to health. These reports are to be addressed in London to the Board of Works, in boroughs to the Common Councils, and in other places to the Improvement Commissioners or the Local Board of Health; and, on their receipt, the body or "local authority" so receiving them is to cause a specification of such alterations or rebuildings as may be required to be drawn up, and is to call upon the "owner" of the premises to carry them out. He may appeal to the local magistrates. If he does not so appeal, he has to decide, within three months, whether he will go on with the required works. If he elects to do so, the local authority may at any time alter at his expense any building which does not meet with their approval, and from their decision in such cases there is no appeal. If he elects not to do so, the local authority may buy the property at a valuation to be made by two surveyors appointed by them on the basis of its "true market value as property unfit for human habitation," and without allowance "in respect of compulsory taking." The property thus acquired may be rebuilt by the local authority, the expenses being paid out of a local rate, not exceeding twopence in the pound per year, and is then to be sold or disposed of on long lease within five years, or the site may be handed over to any company upon condition of building houses for the working classes upon it. Accounts are to be yearly rendered to the Government, but there is no provision for general superintendence or inspection of any kind. The only inspectors of the new building when erected are the health officers appointed by the local authorities themselves.]

[829.]—TELEGRAPH POSTS.—Some time ago a railway company asked my consent to erect on the top of my house a post to sustain a telegraph wire. I consented, as I was assured that I should suffer no inconvenience thereby. I see the question has now arisen about selling the property of this company to the Government. Now, I should like to know how long must my consent be given before the owner of the post can claim that it should remain where it is as a right? Can the company sell for a money value that which I granted as a favour?—R. E. P.

[830.]—PARTY WALLS.—Would some one enlighten me, through "Intercommunication," on the following particulars?—My house is placed at the end of a terrace, and is the same height, at present, as adjoining houses, and both end walls belong entirely to me, not being party walls; the other house, with chimneys, being built against mine. Can I raise on my walls another storey without being responsible by so doing for any permanent damage accruing to the other house? or am I obliged to carry up chimneys of other house with my own? I shall need to take down part of my gables to obtain a proper bed for new work; can I do this without being obliged to protect the adjoining property; or shall I be held responsible for leakage at any future time?—J. P.

REPLIES.

[734.]—BUILDING MATERIALS IN NEW ZEALAND.—In consequence of the receipt of so many letters from all parts of the country asking for the information I offered to give to one of your correspondents, I have found it impossible to answer them all, and so have determined on publishing a short pamphlet, of which I send you a copy.—R. H. D.

[A short notice of this small pamphlet will be found in another column.—ED. B. N.]

[858.]—SPECKS ON DRAWING PAPER.—The proper way to colour cold pressed or plain drawing paper is to lay the colour on with a full brush. The paper should be properly strained beforehand, so as to present a uniform surface to work upon. Blots or spots frequently appear upon drawing paper owing to the fact that the paper is not good of itself, and also owing to what is chiefly to be guarded against by the draughtsman—the pressure of a hot hand upon a part of the surface. Neither ink nor colour will run freely upon a surface upon which anything in the shape of grease or humidity has previously passed.—DRAUGHTSMAN.

[871.]—LIMESTONE AND EARTHENWARE PIPE SEWERS.—It is well known among sewage engineers that up to 18in. the earthenware pipes are to be preferred to the solidly built brick or stone drain, both from its easier and more rapid flow as well as for its economy in laying and first cost. The number of cottages that an 18in. drain would serve would depend upon the manner in which their water supply was arranged; but with a fall so great as 1 in 240 there would be nothing to fear with ordinary house drainage.—S. L.

[875.]—FORM OF GIRDERS.—Your correspondent is in error respecting the fact that the shape of the girders is a fancy of the engineers. The strains upon the upper flanges of the girders vary accordingly as they are inclined or not with reference to the section employed at the different lengths. If a girder be perfectly straight, that is, of a uniform depth, the sectional area of its flanges must vary; but if it be curved according to the laws of a parabola, the sectional area must be constant. It is, in fact, a question of uniform depth versus uniform section, and the local circumstances must decide which is the preferable to adopt.—M. E.

[882.]—PARALLEL RULER.—Will you allow me, through your valuable columns, to state that I fully understand the difficulty of your correspondent "Draughtsman." The only true way to rule parallel lines is by the tee square and the set square. This is all very well so long as the lines are horizontal and vertical, but when they are required to be parallel without the aid of these instruments, the question is not so simple. The only true way of drawing parallel lines is by the means of two set squares, sliding one upon the other in the direction of the line required. A little practice will render this method perfectly familiar.—M. P.

WAGES MOVEMENT.

THE strike amongst the flaggers and slaters of Preston has been settled.

On Tuesday week the Greenock ship-joiners on strike resolved to withdraw their demand for an increase of wages to the extent of 2s. per week, and to return to work on the old terms. The strike which has now terminated was entered upon nine weeks ago.

The labouring classes throughout America continue to make numerous "strikes" for higher wages, and generally with success. In some cases these demands are made for the restoration of wages from which a percentage was taken during the dulness of business last year. Some classes of mechanics in New York are now receiving 4dol. 50c. and 5dol. a day; and, as a general thing, their trade unions are so well organised that they can force employers to pay increased rates when demanded. The American working man shows a bitter hostility, however, to his fellow craftsman from abroad, who are now immigrating in large numbers into the United States, and who always underbid the native labourer. The trade unions seem quite as much opposed to these as to the employers.

At the Hull Police-office, on Tuesday, Donald Mitchell was sentenced to three months' hard labour for having, with other men on strike, intimidated certain of Messrs. Earle's workmen, and so prevented them going to work. The case arose out of a strike at an iron ship building yard, and will be still further investigated, owing to other trades' unionists being implicated.

A laudable attempt has been made by Mr. Sampson S. Lloyd to terminate the stonemasons' strike at Birmingham by inducing the conflicting parties to accept the mediation of Mr. A. J. Mundella, of Nottingham. The masters at once acceded to his proposal; but we regret to learn the men refused to do so, and have probably thus rendered a length ened continuance of the strike inevitable.

STATUES, MEMORIALS, ETC.

A MONUMENT from the hand of the sculptor Molin is going to be erected at Stockholm to the memory of King Charles XII. The inauguration is to take place on the 30th of November next, the 150th anniversary of the monarch's death.

The colossal statue of Luther at Worms is to be inaugurated on the 24th inst., and two following days. Besides subordinate, historical, and allegorical figures, this gigantic representation of Luther stands amid a group of four other colossal statues, above all of which it rises sixteen and a half feet. The statues represent the four precursors of the Reformation—the French Peter Waldo, the English John Wycliffe, the Bohemian John Huss, and the Italian Jerome Savonarola.

The tomb of Abelard and Heloise in Pere la Chaise is being restored. The ashes of this couple, though separated by the Church, are placed together in a leaden box which bears their names.

STAINED GLASS.

A STAINED glass window of three lights has been inserted in the north aisle of the lately restored Church of St. Helen, Bishopsgate, in memory of the late lay rector of the parish. Messrs. Gibbs and Co., of Bedford-square, were the artists.

A memorial window has just been placed in Penkridge Church. The design of the window includes the twofold subject of the Death of Lazarus and the Resurrection of our Saviour. The work is by Messrs. Ward and Hughes, of London.

The east window in the parish church St. George's, Shropshire, has been filled with stained glass as a memorial of the late Bishop Lonsdale, and was exposed to view on Whit Sunday. The subjects in the lancets are the Agony, Christ bearing His Cross, the Crucifixion, the Descent, and the Entombment; the circular lights in the upper portion being respectively Christ upon His Throne, the Good Shepherd, and the commission to St. Peter, "Feed My sheep." The work has been executed by Messrs. O'Connor.

BUILDING AND LAND SOCIETIES.

THE third annual general meeting of the members of the Star Mutual Benefit Building Society was held at Burslem, on Wednesday week. The report and statement of accounts (read by the secretary, Mr. Powell) showed that, after providing for all liabilities and carrying interest at 5 per cent. to every shareholder's account, there was a surplus profit of £885 8s. 1½d., as the result of three years' business, that the funds of the society were safely and satisfactorily invested on mortgage security, and that notwithstanding a large number of withdrawals during the year—involving the repayment of subscriptions to the amount of £1,776 10s., with interest at 5 per cent. thereon—there were now 850 shares in the society, being 31 more than at the close of the previous year.

The usual quarterly meeting of the members of the National Freehold Land Society was held last Friday evening at the Guildhall Tavern, Gresham-street, City, Mr. Ebenezer Clarke in the chair. Mr. W. E. Whittingham, the secretary, read the quarterly report, which showed that the deposits received from members had amounted to £141,000, and the advances repaid by members to £17,187 16s. 10d., while on the other hand the deposits withdrawn had been £129,426 7s. 3d., and the advances to members, £31,274 19s. 7d. A sum of £56,560 16s. 5d. was received from, and £55,340 4s. advanced to the British Land Company. The other advances repaid were £29,249 8s. 6d., and the other advances made, £28,625. The total receipts of the quarter which ended on the 30th ult., including a balance of £15 687 5s. 2d., brought forward, amounted to £259,588 3s. 11d., and the payments to £246,486 9s. 9d., leaving £13,501 14s. 2d. in hand. The members' capital stood at £1,007,748 8s. 6d. The chairman briefly moved the adoption of the report, observing that the advances to members exhibited an increase of £10,000 as compared with the corresponding quarter of last year.

The fourth annual report of the North Staffordshire Permanent Economic Benefit Building Society has been published. The committee state that the receipts (exclusive of redemptions) have amounted to £8,557 8s. 2d., being an average of £164 11s. 3d. per week, an increase of upwards of £2500 over last year. The amount received from depositors has been £1,953 5s. 5d., which is more than the amount received during the three previous years. The payments, which amount to £1,050 11s 9d., have also been proportionately greater. The stock account shows a balance in favour of the society of £290 1s. 6d, and the committee therefore recommend that a dividend of 1½ per cent. on the amount of subscriptions received be paid to those members entitled thereto until the next annual meeting.

LEGAL INTELLIGENCE.

PEW RENTS UNDER THE CHURCH BUILDING ACTS.—A case of some importance was heard at the Court of Exchequer, before Baron Pigott and a common jury, two or three days ago. It raised a question under the Church Building Acts as to the liability of churchwardens to pay a minister's stipend out of the pew rents. The plaintiff, the Rev. Henry Robert Lloyd, was perpetual curate of the district church of St. Mark's, Kennington, and he brought the action against Mr. Burrup, the elected churchwarden of that church, and Mr. Reeve, the minister's churchwarden, to recover £215, being two quarters of his annual stipend, which became due on the 24th June, 1867. It seemed that some differences had arisen between Mr. Lloyd and his parishioners, and that the pew rents had in consequence fallen off. The contention, on his part, was that his stipend was a first charge on the pew rents, and that at the time of bringing the action the defendant had money in hand from that source, ample to cover the arrears due, and which was properly applicable to payment of his claim. A portion of the pew rents had been devoted by the defendants to the repair of the church and other purposes connected with it. Under the Church Building Acts the stipend was to be paid out of pew rents received during the year, and the question whether the defendants had enough money in hand to pay it depended upon the period at which the computation of the year should commence After a long discussion, the parties came to an agreement as to the actual receipts and disbursements of the churchwardens, and there being no question of fact for the jury they were discharged from giving a verdict, and a verdict was formally entered by the learned judge for the defendants, with leave to the plaintiff to move, in order that all the questions of law involved in the case might be argued in the court above.

ALLEGED OBSTRUCTION OF LIGHT AND AIR.—POTTS *v.* SMITH.—This case was argued in the Vice Chancellor's Court, on a motion for an injunction to restrain the alleged obstruction of plaintiff's light and air. The premises are taken of the same landlord, the Earl of Harrington; the plaintiff having a contract from William Jackson, who was lessee under an ordinary lease with the usual covenants, and the defendant deriving his title under Jackson, or the Earl, to the adjoining plot of land, both plots being situate in Cornwall-road, Queen's-gate, South Kensington. The defendant's plot was west of plaintiff's, and an arrangement was come to between them as to the west wall, which was 7ft. high, by which the plaintiff alleged it was not to be raised above a certain height; but on Easter Monday a considerable number of workmen were put on, and the wall by the evening was run up 16ft., in all 23ft. This led to the filing of the bill, which alleged material interference with the light and air to the east windows of the plaintiff's house, viz.—the dining room, pantry, kitchen, and library, and the free access of light and air to his ornamental garden; and the affidavits for him stated a material interference and injury accordingly, there being chimneys in the wall. On the other hand, Mr. Jackson had made an affidavit speaking to the plaintiff's previous knowledge of what was intended, and that this was all building land, and that at his own request the house was placed further back. The plaintiff's case was rested on the material injury, the mode in which the wall was run up, the covenant for quiet enjoyment, which was said to be a contract against such interference, and that the plaintiff did not know what was contemplated. On the other hand, the defendant contended that the covenant did not constitute a contract embracing the case made; there was not such an interference as the Court would interpose to prevent, and that the plaintiff was perfectly aware of the nature of the tenure of the adjoining land. Vice-Chancellor Malins thought the plaintiff had failed to make out sufficient injury to warrant the interposition of the Court. He had, in fact, neglected to stipulate in his contract for what he now claimed, and what therefore he was not entitled to. On these grounds the bill must be dismissed, but (considering that the defendant led the plaintiff to believe that he would not raise the wall beyond a certain height, and had on an unusual day run it up suddenly, evidently to prevent the possibility of stopping it) without costs. Had the plaintiff been right his Honour would have ordered every brick to be removed.

Our Office Table.

Baron Haussmann is about to make another raid on Paris. The famous Rue de la Paix is doomed. A new street is to run diagonally from the Boulevard and to the bottom of the Rue Richelieu, and thus connect the New Opera House with the Theatre Francais. All that will be left of the Rue de la Paix is henceforth to be called the Avenue Napoleon.

At their last meeting the Clerkenwell Board of Guardians came to the determination to erect a new workhouse on the site of their freehold estate at Highgate. They appointed a committee of their number to visit the modern-built metropolitan workhouses preparatory to plans being drawn up.

Some short time since, a fatal accident took place at the corner of Baker-street, King's Cross-road, and at the inquest the jury recommended that a constant supply of gravel should be laid down at that point. The vestry, however, are of opinion that such a course would effect little or no good. They considered that a far more effective course would be to station a policeman at the point, and prevent reckless driving. The clerk was instructed to convey this suggestion to the Police Commissioners. We regard this as a step in the way of getting our street traffic brought under control, as suggested by us elsewhere.

The ancient church of Wharram Percy, on the Yorkshire Wolds, is quite apart from all human habitation. Only on Sundays is the church frequented, and the congregation have been somewhat surprised to find a breed of foxes in possession. An air-drain for ventilation from the outside has been used as an "earth," and by this means access has been gained to the pulpit, beneath which an old fox and her litter of fine cubs are—except when unearthed during divine service—comfortably domiciled. A very friendly feeling is manifested towards the little strangers, and in such a fox-hunting country they are, sure to receive fair play.

The Bath Stone Company, which raised rich hopes in the way of dividends, has just held its half-yearly meeting. Instead of a dividend, there was a deficiency of £144 8s. 2d, and in addition, £196 0s. 10d. as bad and doubtful debts.

The committee of the new Marlborough Club have bought that well-known house in Pall Mall where the British Association was for so many years, and are about to have it converted into a club, under the direction of Mr. David Brandon. Messrs. Trollope and Sons have taken the contract.

In the matter of the Park Lane Improvement Bill, the committee have agreed to a special report, published on Saturday, to the effect that, in their opinion, the inconvenience at present experienced from the over-crowded state of the traffic of Park-lane would be best obviated by opening up Hamilton-place as a thoroughfare for public traffic, with a width of not less than 60ft. roadway, to be obtained by removing the houses and other buildings on the eastern side.

The annual meeting of the Emperor Fire and Life Assurance Societies was held on Wednesday at the City Terminus Hotel, Cannon-street. The report read by the secretary, Mr. E. Clark, jun., showed that during the year 1,555 proposals had been received, amounting to £421,473, and policies issued for £335,970. The claims in the life department for the year had been only £4,784, and fire claims £1,623. All claims were payable within fourteen days after proof of death. A bonus had been given to the life-policy holders during the year of from 22 to 50 per cent. on the premiums previously paid, and new tables introduced to meet the requirements of members of building societies for redeeming mortgages, either immediately or after policies become claims. The retiring directors were re-elected, and Messrs. G. F. Larking, J. Jones, W. Middleditch, and W. E. Whittingham were elected auditors. A dividend of 5 per cent, free of income tax, and a bonus of 1 per cent., were declared.

It being deemed advisable to arrange and lessen the mass of papers which have accumulated since the foundation of the Institute of British Architects, members are informed that there are in stock several of the annual reports, and some detached copies of the papers read at the evening meetings, which can be had without charge, to complete defective sets, on prompt application to the librarian.

The council of the Society of Arts gave a brilliant *soiree* on Wednesday evening last, at South Kensington Museum. We believe it was the largest and most brilliant meeting of the kind held under the auspices of this society.

At the general monthly meeting of the Royal Institution of Great Britain, held on Monday last, Sir Henry Holland, Bart, M.D., D.C.L., F.R.S., president, in the chair, Mrs. Alfred Morrison and Rev. J. George Wrench were elected members. The special thanks of the members were returned to Sir Henry Holland, Bart., the president, for his tenth annual donation of £40 to the fund for the Promotion of Experimental Researches.

The preparations for the great Handel triennial celebration may now be said to be complete in all respects. The whole of the instrumental band has been engaged, comprising the most eminent professional and amateur instrumentalists from all quarters, both native and foreign: and when it is stated that the stringed instruments alone will number something like four hundred and twenty, a slight idea may be formed of the extent of this vast orchestra.

At the ordinary general meeting of the Institute of Architects, held on Monday evening, 18th May last, William Tite, M.P., president, in the chair, the following recommendations for membership were read:—William L. Bernard, of 3, Westminster Chambers, Victoria-street; Richard James Jones, of 8, Lind-terrace, Ryde; George Patrick, of Burnley-road, Stockwell, as associates. The following gentleman was balloted for, and declared to be duly elected:—John O. Abbott, of 6, Whitehall, as associate. The following gentlemen, having attended for the first time since their election, were duly admitted by the president, viz.:—Archibald C. Ponton, of Athenæum Chambers, Bristol; Edmund Francis Law, of Northampton, as fellows; Robert Pledge Notley, of 53, Gracechurch-street, E.C.; Percival Isaac James, of 27, King-street, E.C., as associates.

The deputation which was sent to Salford by the vestry of St. George the Martyr, to inquire into the system of tramways which has for many years been in use there, has returned, and given a report against its adoption in Southwark.

The lectures in course of delivery at the London Mechanics' Institution, under the auspices of the committee appointed by the Working Men's Club and Institute Union, are being continued. The second course will commence on Tuesday next.

On Sunday evening the pier at Rosherville was discovered to be on fire. It is believed that a lighted fusee had fallen through a crevice in the timbers, and caused the fire. A large sheet of flame was seen to issue from the pier, and for some time the timbers, which were dry, and coated with pitch and tar, blazed furiously. It was not until considerable damage had been done that the flames were subdued. This is the fourth time that the pier has been on fire, and each fire has occurred at Whitsuntide.

The Baroness de Stampe, who was the devoted friend and patroness of Thorwaldsen, the great Danish sculptor, and at whose château the artist passed the latter years of his life, surrounded by her with every mark of affection, has just died at Nysee, in Denmark, in the château of Stampeborg, in which she had a studio fitted up for him and where he executed his last works.

Mr. T. W. Rammell has addressed to Sir John Thwaites, chairman of the Metropolitan Board of Works, a letter, in which he explains a proposal to form a new means of communication across Hyde Park, in connection with a disused line of conduit belonging to the Board. The line referred to was formerly known as the Bayswater tunnel sewer, and crosses the park in a nearly direct course from Albion-street, in the Uxbridge-road, to Albert-gate, Knightsbridge. Mr. Rammell's proposal is to convert it into a pneumatic tubular way, for the conveyance of passengers across the park. The existing conduit is 6ft. 3in. in height by 5ft. 6in. in width in the clear, and in a tolerable state of preservation except at the lower part. To effect its conversion, it would be necessary to deepen and underset the side walls to the extent of about 2ft. 6in., to put in a new invert to the work, and generally to repair it, rendering the greater part of the interior in Portland cement. By these works—which would be carried to completion entirely from the inside, and without any disturbance of the surface of the park—a substantial and durable tubular way would be formed, 8ft. 9in. in height by 5ft. 5in. in width in the clear, and perfectly sweet and wholesome in itself. The increased gauge of tube thus obtained would be both high enough and wide enough for the passage of a fair-sized omnibus carriage, that is to say, a carriage 6ft. 3in. high and 5ft. across in the clear, and therefore more roomy than the ordinary street omnibus, which, as a rule, does not exceed 4ft. 6in. in width and 6ft. in height. This carriage would run upon a pair of light steel rails, of 3ft. 6in. gauge, to be laid on wooden sleepers imbedded in the invert.

WORKS OF INDIAN ART.—At the India Museum, Whitehall, may now be seen a magnificent collection of objects in jade and crystal, made during many years' residence in India by Colonel Charles Seton Guthrie, of Scotscalder. This collection is believed to be not only the most numerous, but the finest of its kind, and is of very great value. Indian jade is more valuable than that of China in the estimation of connoisseurs. The material is not common in this country or in France. The English public is familiar with that example in the British Museum which is carved into the form of a tortoise, and has long been reckoned as a trimmph of laborious art. This was found on the banks of the Jumna, near Allahabad. Jade, or nephrite—which is the scientific name of this stone,—is one of the hardest of substances, and is very tough. It is, on account of these qualities, wrought with such extraordinary difficulty that many persons believed the Chinese were in the possession of a secret process by means of which they softened it temporarily so as to render it tractable. There is little doubt, however, that in such works as Colonel Guthrie has collected we have results of that apparently indomitable patience in labour which characterises oriental lapidaries, and that they were carved by means of ordinary metal tools with corundum or diamond-dust. The principal difficulty of working jade arises from its peculiar nature, which absorbs, so to say, the corundum into its own surface, and thus grinds away the metal tools employed upon it. The cunning of oriental lapidaries has overcome this difficulty in manipulation. The articles which are now exhibited at Whitehall comprise boxes of jade, some of which are formed of the material in layers of different tints of light greyish green and darker green, one layer of which is in the fashion of fret-work, pierced in patterns, and applied so that the second layer shows through its interstices. There are also sword and dagger handles, cups of many forms, ewers, back scratchers—such as the ladies of Delhi used for the comfort of their skins, just as certain great-grandmothers of our own employed the like instruments,—spoons—many of which have beautiful forms and carvings upon their surfaces,—hookah-bottles—the surfaces of which are inlaid with gold and rubies,—arm-rests for the use of nobles when reclining, and formed like short crutches. With these are included boxes or caskets, which have been so delicately wrought that their covers adhere, under the pressure of the air, to the lower portions or bodies of the objects. This result shows, more strikingly than any other, the mathematical accuracy of the workmanship. One casket of considerable dimensions is lobated in its outline, yet the cover fits the body truly in whatever way the lobes of the one are applied to those of the other. Many of the patterns of the superficial decorations of these articles are finely designed and beautifully worked. The objects in crystal are smaller in number than those in jade, and the material is less uncommon, but they are worthy of admiration. We believe that the opportunity is now offered to the Indian authorities of obtaining this collection of art-treasures with the view of adding it to those now accumulated in the India Museum.—*Athenæum*.

MEETINGS FOR THE ENSUING WEEK.

MON.—Royal Institute of British Architects. Discussion on the paper read May 18, "On the Foreign Artists Employed in England during the Sixteenth Century, and their Influence on British Art," by Digby Wyatt, F.R.I.B.A.—A short description of the Plans of Hospitals at Paris, Munich, and St. Petersburg, by Dr. Oppert.

TUES.—London Mechanics' Institution.—Technical Education for Working Men, second course, "Iron and Wood," by F. C. Calvert, Esq., Ph. D., F.R.S.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3206 J. CARTER AND T. CHALMERS. IMPROVEMENTS IN THE DETAILS AND FITTINGS OF WINDOWS, DOORS, AND OTHER SIMILAR CONTRIVANCES APPLIED TO BUILDINGS AND OTHER STRUCTURES. Dated November 12, 1867.

This invention has reference to two former patents, dated respectively June 14, 1867 (No. 1616), and February 16, 1867 (No. 432), and consists in forming the "architraves," "facings," "plates," and other ornamental details, wholly or partly of cast iron, brass, steel, marble, slate, porcelain, glass, encaustic tile or terra cotta work. The porcelain, glass, or other materials, may be used in different colours, as in encaustic tile work. These can be fixed to the cases by screws very quickly, and, when so fixed, present a more finished external appearance (and at half the cost of masonry) than where cutting or hewing of stone is required. The invention also includes the formation of bases, stringcourses, corners, and coping, of every description of the materials mentioned to be used in combination with stone and brickwork, and will be of great value for covering, protecting and ornamenting lintels, wood, beams, and other contrivances for the outside of buildings. In brickwork where the walls are 9in. thick, or thereabouts, the wood lintel may be kept all the breadth of the wall, and the outside edge of the same may be protected from the weather by means of an ornamental metal plate and flange.—Patent completed.

3215 U. FERRENOUD-WURFLEIN. IMPROVEMENTS IN INSTRUMENTS FOR JOINING BLIND CORDS AND OTHER CORDS. Dated November 13, 1867.

Here, in order to form a union between the ends of such cords, the patentee employs two coiled springs of wire, into the end of one of which a hook is screwed or fixed, whilst the end of the other receives a corresponding eye in a similar manner. The coiled springs are respectively screwed on to the two ends of the cord to be joined until the ends have entered sufficiently far into the springs to be firmly held. The two ends of the cord thus furnished are then hooked together, and so an endless cord is obtained, which is able to pass very freely over pulleys, such as blind pulleys, and the elasticity of the spring serves to keep the cord tight upon the pulleys, and to compensate for any change in the length of the cord arising from variation in the moisture of the atmosphere.—Patent completed.

3121 W. GEEVES. IMPROVEMENTS IN THE CONSTRUCTION OF PANEL DOORS AND FRAMES. Dated November 5, 1867.

According to this invention the patentee makes the mortices with parallel ends, and between each end of a mortice and its tenon (which is parallel, as heretofore), he inserts two keys or wedges; one he places in the key way with its broader end inwards, and he then drives the other key or wedge home upon it. On the inner sides of the tenons he forms the driven wedges considerably longer than the tenons, so that they drive into holes formed for them in the substance of the rails, and serve also as dowels.—Patent completed.

3141 E. SEPHTON. IMPROVEMENTS IN THE CONSTRUCTION OR ARRANGEMENT OF BLOCKS OF SO CALLED WORKMEN'S DWELLINGS. Dated November 7, 1867.

Here the outer walls of each block of dwellings are of any desired outline in plan, and the rooms are arranged and set apart to suit the proposed class of tenants. The entrances from the street are by passages or covered ways to the back of the block, where corridors and staircases common to the tenants branch off. The staircases lead to terraces running along each floor at the back of the building, and from the terraces the doors of the respective tenements open, each tenement being preferably so arranged that one half of the apartments have light from the front of the block, and the other half from the back thereof. At certain distances, say each tenth or twelfth dwelling, a vertical shaft to receive ashes and other waste rises upwards through the terraces. Folding doors or traps are fitted to the said shaft on each terrace, and when water-closets are not provided in each dwelling, they are placed around or near the shaft.—Patent completed.

3060 A. V. NEWTON. IMPROVEMENTS IN THE VENTILATION OF BUILDINGS. (A communication.) Dated October 30, 1867.

This invention relates to a mode of supplying fresh air to apartments, and to compartments of carriages, and withdrawing and discharging the vitiated air therefrom, without producing draughts. In applying the invention to buildings, say, for example, to a hospital, which requires specially good ventilation, the internal walls are built hollow, that is, with vertical air passages in them. The portion of the wall between the air passages and the chamber or ward to be ventilated is built of bricks pierced with holes, which, as the bricks are laid, form small horizontal air channels for the air supplied to the vertical air passages. The passages are divided horizontally at a height of, say, five or six feet from the floor, and distinct air flues connect with the upper and lower divisions thus formed, the larger or upper division being used for supplying cold, and the smaller and lower division for supplying heated air to the ward or chamber. The wall is faced with porous cement, which allows the air at a pressure to percolate through, in minutely divided streams, into the chamber, after the manner of tent ventilation. The roof of the chamber is also porous, and it forms between the girders, which may be of iron, air exhaust flues. Below the floor of the chamber, or ward above, are also air flues, separated from the lower flues by substantial laths enveloped with some material that is a good non conductor of sound. These flues are connected with vertical exhaust flues built in the walls, and connected with a chimney shaft, or an exhaust fan, to quicken the withdrawal of the vitiated air.—Patent completed.

3080 S PARR AND A. STRONG. IMPROVEMENTS IN THE CONSTRUCTION OF BUILDINGS, ARCHES, BRIDGES, COFFER-DAMS, WHARF WALLS, AND SUCH LIKE STRUCTURES, AND IN THE FLOORS AND ROOFS OF BUILDINGS, AND FLOORS IN OTHER SITUATIONS. Dated November 2, 1867.

The object and intention of these improvements is to cover, enclose, or divide floor buildings and open spaces with materials of different kinds, combined together in a novel manner, for ensuring strength and economy in the construction, and for rendering them fireproof, and, further, to construct arches and bridges, and such like structures, of greater strength, with less materials, than at present used.—Patent abandoned.

Trade News.

TENDERS.

WALTHAMSTOW.—For the erection and completion of a row of four cottages at Walthamstow, Essex, for Mrs. Newmnn. Mr. G. F. Payne, architect:—

Vickers and Harding (accepted)	£990

CROYDON.—For alterations and additions to boot and shoe manufactory, for Messrs. Cooper and Son, Lower Coombe-street, exclusive of iron staircase. Mr. George Gough, architect:—

Webb	£230 0
Hill, Claxton, and Hobbs (accepted)	212 10

Messrs. Ward and Price declined tendering unless time was extended.

CHRISTCHURCH UPWELL.—For new school and residence at Christchurch Upwell. Mr. William Smith, John-street, Adelphi, architect:—

Elworthy	£671 16 8
Berry	551 0 0
Bennett	499 13 0

THE MUSEUM OF BUILDING APPLIANCES,
(ARCHITECTURAL SOCIETIES' HOUSE, 9, CONDUIT STREET),
23, MADDOX STREET, HANOVER SQUARE, LONDON, W.,

In Connection with the ARCHITECTURAL EXHIBITION, has been established in this the central home of the various Architectural Societies of England.

OPEN DAILY THROUGHOUT THE YEAR. ADMITTANCE FREE.

The design of the Museum is to collect reliable information regarding all Building Appliances, and especially New Inventions and Improvements, and to communicate the same *gratuitously* to *Architects* and others interested in Building.

Prospectuses, with Terms for the Exhibition of Models, Specimens, &c., may be obtained of the Curator at the Museum.

NAMES OF EXHIBITORS.	(SEASON 1868.) WORKS REPRESENTED.
Antil, J.	Patent Cast-lead Stench Traps.
Arrowsmith, A. J., and Co.	Solid Parquet Floors—Bent Wood Furnitur .
Atkins, T. and Son	Moulded Carbon Filters.
Ayling, Stephen	Architectural Photography.
Baker, Rev. R. S.	Eagle Lectern in Carved Oak.
Barlow, Finja, and Co.	Moulded Bricks, Tiles, &c.
Bartlett G.	Cement and Plaster Ornaments.
Beale, Montague, and Co.	Gas and Hydraulic Works
Blashfield, J. M.	Terra Cotta and Architectural Pottery.
Boote, T. and R.	Encaustic and other Tiles
Bovey, J.	Varieties of Devonshire Marbles.
Boyd, D. O.	Patent System of Ventilation.
Braby, F., and Co.	Zinc Roofing, Corrugated Galvanised Iron and Mouldings.
Broomhall Tile Company	Patent Roofing Tiles, Damp-proof Course, Concrete Walls.
BUILDING NEWS	Architectural Journal.
Bullivant T.	Patent Airtight Noiseless Sliding Sash.
Burnett, Sir W. and Co.	Preserving Process for Timber, &c.
Burt and Potts	Wrought iron Watertight Casements.
Chatwood and Co.	Patent Safes and Locks.
Coalbrookdale Company	Ridge and Roofing Tiles, Crestings.
Cooper, J. K.	Roofing Tiles, Ridge Crestings.
Copeland, W. T. and Sons	Porcelain and Stoneware Slabs and Tiles.
Cornell, J.	Art Metal Works.
Coulton, J. L.	Stained Glass Works and Decorations.
Curtiss, W.	General Building Works
Ceramic Art Union	Ceramic Statuary, Vases, &c.
Davies, C. H., and Co.	Genuine Solid Parquet Floors.
Doulton and Co.	Terra Cotta Panelling.
Engert and Rolfe	Asphalted Roofing Felt.
Farnworth, J. H.	Patent Self lifting and Self fastening Sash.
Fox, Robert	Patent Fastenings, Zinc Roofs, Sashes, &c.
Gane, C., and Co.	Green Roofing Slates, Gane's Eureka Tint.
Gibbons and White	Patent Mortise Furniture, Iron Casements.
Glover G., and Co.	Improved Dry Gas Meters.
Godwin, W.	Encaustic Tiles, Tesselated Pavements.
Hall, M.	Ornamental Lead Work.
Hall, W.	Oxide of Iron Paint.
Hart, J., and Son	Art Metal Works and Brasses.
Haward, J.	Wall Decorations.
Hogg, W. S.	Fireproof Doors and Columns.

NAMES OF EXHIBITORS.	(SEASON 1868.) WORKS REPRESENTED.
Hopton Wood Stone Company	Fossil and other Marbles.
Johnson, G.	Patent Building Hoists.
Jones, J., and Sons	Hot Water Apparatus, Boilers, &c.
Lee, W. and J.	Patent Double-action Mortise Bolts and Locks.
Letheren and Randle	Art Metal Works.
Lizard Serpentine Company	Cornish Serpentine Marble.
Lloyd and Summerfield	Crystal Sash Bar, and Aquariums.
Lowther and Co.	Patent Sun Blind, "Helio-Scene."
Macnaught, Robertson and Co.	Rolled Iron Girders and Joists.
Malkin and Co.	Encaustic Tiles and Mosaics.
Matthews, E.	Monumental Brasses.
Madwell and Son	Clipsham Down Building Stone.
Merryweather and Sons	Fire Engines, Hydrants, Fire Apparatus.
Minton and Co.	Encaustic and other Tiles and Mosaics.
Morris and Field	Sanitary Appliances, Baths, Lavatories, &c.
Moseley and Hooker	Electric Bells and other Apparatus.
Moule	The Patent Earth Closets
Norris and Son	Moulded Bricks, Ridge Tiles, &c.
North Devon Pottery Company	Stoneware Closet and Apparatus.
Parnall Strong	Patented Vellular Construction Hexagon Hollow Tubes.
Potter and Son	General Building Works.
Ridgway and Bellerophe	Encaustic and other Tiles.
Rosher, F. and G.	Bricks, Tiles, Portland Cement.
Sax, J.	Electric Bells and Indicators.
Scammell and Co.	Door Furniture, Finger Plates.
Sidebotham, Banks, and Co.	Patent School Desks and Seats.
Smith, A. and Co.	Patent Double action Door Springs.
Smith and Fuener	Patent Door Springs.
Standing and Marten	"Creeke's" Patent Capped Drain Pipes.
Tingey, W., and Son	Portland Cement.
Tuddenham and Co.	Patent Improved Twisted Iron.
Tyler, J. W., and Co.	Zinc Roofs Dormers, Mouldings, &c.
Walford and Donkin	Fret Carved Chairs.
Warren, G.	Scagliola for Architectural Purposes.
Water Purifying Company	Patent Syphon Cistern Filters.
Watson, Charles	Double Current Syphon Ventilators.
Westminster Gas Meter Co.	Improved Registering Gas Meters.
Wheeler Brothers	Moulded and Pressed Bricks.
Whieldon, Lecky, and Lucas	Spherical Hinges, Gate and Door Fittings.

This List will be rapidly added to, and it is believed that the Museum of Building Appliances is capable of almost indefinite extension. Exhibitors are urged to record the fullest information, and no trouble will be spared to procure for architects, *gratuitously*, any further information which may not already be recorded upon the books of the Museum. Architects and their clients are solicited to choose from the Specimen Works exhibited, and orders will be received for transmission to the exhibitors if desired. All applications to be made to THE CURATOR.

THE MUSEUM OF BUILDING APPLIANCES,
23, MADDOX STREET, HANOVER SQUARE, LONDON, W.

Just Published, Imperial 4to, half bound in morocco, £3 10s.,

VILLA AND COTTAGE ARCHITECTURE,
SELECT EXAMPLES OF COUNTRY AND SUBURBAN RESIDENCES RECENTLY ERECTED, with a Full Descriptive Notice of Each Building.

Thirty Villas and Cottages, the Works of Nineteen different Architects, are Illustrated by Plans, Elevations, and Sections, together with occasional Perspective Views and Details. The buildings are fully described, and in nearly every case a statement of the actual cost is given.

London: BLACKIE and SON, 44, Paternoster-row.

NEW ZEALAND.—A SHORT SKETCH of the ISLANDS of NEW ZEALAND, showing the advantages to agriculturists and labourers. Free for two stamps.—The Library, Stanstead-lane, Forest Hill.

Second edition, 4s. 6d., cloth,

A CLUE to RAILWAY COMPENSATION for Property and Person, compulsory sale under special Acts, the nature and value of estates, and the principles of parochial assessment. With Notes, and a Supplement founded on recent authorities. By THOMAS MORRIS, Architect. Also,

DILAPIDATIONS, ECCLESIASTICAL and GENERAL: their nature, and the principles of assessment succinctly demonstrated. With an Appendix on party walls and statutory regulations. 4s., cloth.

London: SIMPKIN, MARSHALL, and Co.

NEW WORK BY JOHN BOURNE, C.E.

Published this day, part I., In 4to, price 2s. 6d.

EXAMPLES of MODERN STEAM, AIR, and GAS ENGINES of the most approved types, as employed for Pumping, for Driving Machinery, for Locomotion, and for Agriculture, minutely and practically described. Illustrated by working drawings, and embodying a critical account of all projects of recent improvements in furnaces, boilers, and engines. By JOHN BOURNE, C.E., Author of a "Treatise on the Steam Engine," &c.

*** To be continued Monthly and completed in 24 parts, price 2s. 6d each, forming one volume, illustrated by about 50 plates and about 400 woodcuts

London: LONGMANS, GREEN, and Co., Paternoster-row.

TO BUILDERS.—MONEY ADVANCED as the work proceeds by the BUILDERS and GENERAL ADVANCE ASSOCIATION (Limited).—Particulars and forms of application may be obtained of the Secretary.—Offices, 110, Cannon-street.

SCHWEPPE'S MINERAL WATERS. By Special Appointment to Her Majesty and H.R.H. the Prince of Wales. Every bottle is protected by a label having name and trade mark.—Manufactories at London, Liverpool, Derby, Glasgow, Bristol, Malvern.

C. H. DAVIES and CO.'S
GENUINE AND ARTISTIC
SOLID PARQUET FLOORS
N.B.—Designers and Practical Joiners.
CAMBRIDGE HALL, NEWMAN STREET
LONDON.

GILT ROOM BORDERING.
½-in. OG, 6s. per 100 feet; ¾ OG, 7s.; 1 in. OG, 10s. 6d.
EVERY DESCRIPTION of PICTURE FRAMES and MOULDINGS kept on Stock, at the Lowest Prices. Regilding to the Trade.
At GEORGE REES'S, 57, Drury Lane.

EXAMPLE OF BONUSES GIVEN BY
THE EMPEROR LIFE ASSURANCE SOCIETY.
52, CANNON STREET, LONDON, E.C.,
To March 31, 1867.

Sum Assured.	Formerly a Life policy now payable at death or in the following number of years	Or bonus in addition to the sum assured.	Or cash in reduction of the next annual premium.	Or reduction of all future annual premiums.
£		£ s. d.	£ s. d.	£ s. d.

THE NEXT BONUS WILL BE DECLARED IN 1870.

A Dividend of 5 per Cent., with a Bonus of 1 per Cent. paid to the Shareholders.

Claims paid within 14 days after proof of death.

Advances made on Freehold and Leasehold Securities.

Fire Insurance at the usual rates. Duty reduced to 1s. 6d. per Cent.

Forms of Proposal for Assurance, Prospectus, &c., forwarded on application to

EBENEZER CLARKE, Jun., Secretary,
52, Cannon-street, E.C.

WHY PAY RENT?

THE ARTIZANS, LABOURERS', and GENERAL DWELLINGS COMPANY (Limited).

Established under the Companies' Act, 1862.

Capital, £250,000, in 25,000 Shares of £10 each.

Deposit, 10s. per Share on application, and 10s. on allotment.

PRESIDENT.—The DEAN of WESTMINSTER.

ARBITRATORS.

The Right Hon. Earl of Shaftesbury, K.G.	Lord Elcho, M.P.
	Mr. William Thompson
The Right Hon. Earl of Lichfield	Mr. David M'Gregor
	Mr. James Fletcher

BANKERS.—National Bank (Charing-cross).

SOLICITORS.—Messrs. Laundy and Kent, 5, Cecil-street, Strand.

SECRETARY.—Mr. William Swindlehurst.

CHIEF OFFICES.—147, Strand, London W.C.

This Company is specially formed to assist the working classes obtain improved dwellings from the best designs, at the lowest possible cost, upon the co-operative principle.

THE PURCHASE OF A HOUSE.—See Prospectus.

No Solicitor's or Surveyor's Fees are charged. A Fixed Rate of Interest of 5 per cent. is charged upon Purchase-money upon the Property erected by the Company.

No Beershop, Inn, or Tavern shall at any time be erected on any property of the Company.

Further information may be obtained at the Office, Prospectuses sent by the Secretary, on receipt of a letter enclosing a postage stamp.

ACTIVE AGENTS WANTED.

UNDER THE PATRONAGE OF H.M. THE QUEEN.

THE LONDON PARQUETRY WORKS,—The first Establishment founded in England (in 1842) for the exclusive manufacture of Solid and Plated PARQUET FLOORS and BORDERS, CEILINGS, and WALL DECORATIONS; and Sole Patentees of the only system adapted to the English climate, whereby the evils of DRY ROT, SHRINKAGE, and WARPING (so common to work manufactured in foreign climates), are EFFECTUALLY PREVENTED.—For designs, estimates, and list of nearly 300 floors, &c., apply to THE LONDON PARQUETRY WORKS, Grove-lane, Camberwell, S.; or to their Sole Agents, Messrs. Gillow and Co., 176, Oxford-street.

H. CLAYTON and CO., Atlas Works, Woodfield-road, Harrow-road, W.—Patent Brick, Tile, and Drain-pipe Machinery.—Whereas certain workmen, recently in our employ, have issued a circular, signed "Paine, Slaughter, and Amor," representing that the business of the above works had ceased to be carried on, and that they were engaged in the manufacture of similar machines to those for which we have obtained a world-wide reputation, and they having sent such circulars to our customers, and such circulars having been deliberately framed to deceive them and the public generally, we, on Saturday last, applied for and obtained from Vice-Chancellor Sir Richard Malins an INJUNCTION, restraining the above workmen from publishing or circulating the said circular, or from otherwise representing or inducing, or attempting to induce any person or persons to believe that our business is no longer carried on; and whereas the above workmen having, also, while in our employ imperfectly made use of numerous valuable patterns of machinery belonging to us, the Vice-Chancellor Malins also granted an Injunction restraining them from making use of any such patterns or any castings taken therefrom.—Dated May 18, 1868. H. CLAYTON and CO.

THE PRIZE MACHINE of the PARIS EXHIBITION, 1867.—CLAYTON and CO., patentees and manufacturers of the new and improved prize BRICKMAKING MACHINES, for working by steam, water, animal, or hand power, for expression. The A. Q. six roller machine, combining the three processes of crushing, pugging, and moulding, which obtained the prize at the Paris Exhibition of 1867, is equal to the manufacture of from 20,000 to 25,000 bricks per diem, worked with a 12-horse power engine; no brick foundation required; sanitary pipe machines, up to 24in. diameter; steam engines, mortar mills, contractor's plant, sugar machinery, &c.—Engineers, iron founders, and manufacturers of all kinds of machinery and mill work, Atlas Works, Woodfield-road, Harrow-road, London, W. Illustrated catalogues sent post free upon application.

SIX POUNDS PER WEEK WHILE LAID UP BY INJURY, AND
£1,000 IN CASE OF DEATH,
Caused by
ACCIDENT OF ANY KIND
May be Secured
BY AN ANNUAL PAYMENT OF FROM £3 to £6 5s.
To the
RAILWAY PASSENGERS' ASSURANCE COMPANY.
64, CORNHILL, and 10, REGENT STREET, LONDON
WILLIAM J. VIAN, Secretary.

CARTS, LADDERS, BARROWS, &c.—GEORGE ELL and CO., Builders of Carts, Vans Waggons Trucks, Trolleys, &c., Contractors' and Builders' Plant.
LADDERS, BARROWS, TRESTLES, STEPS, PORTABLE SCAFFOLDS, PICK-HELVES, HAMMER HANDLES, &c.
Wheels made by Improved Machinery on the Premises.
A large Variety of both Light and Heavy Wheels kept in Stock.
Barrows, Dobbin, and other Carts, intended for Exportation, and made by Machinery so as to be interchangeable in their parts.
Dobbin Carts, 4?; Brick Carts, £15; Navie barrows, 10s. 6d.
Scaffolding, Ladders, Barrows, Trestles, Step, &c., Lent on Hire.
Price Lists on application.
GEORGE ELL & CO.,
EUSTON WORKS, 366 and 368, EUSTON ROAD, LONDON, N.W

THE BUILDING NEWS.

LONDON, FRIDAY, JUNE 12, 1868.

THE ARCHITECTURAL EXHIBITION, CONDUIT-STREET.

SECOND NOTICE.

IT would be neither possible nor desirable to speak in detail of every drawing exhibited on these walls, and yet the critic who undertakes the task of reviewing such a collection of drawings ought, without doubt, to give each its fair share of consideration, and silence on his part should be as eloquent as words. Indeed, we are sadly conscious that, unless words be well weighed, silence may well bear away the palm. We cannot pretend, however, to more than a desire to do justice. No. 1 (sketch of north doorway to Roslyn Chapel) W. Richardson, is a clever and effective sketch, sufficiently well seen in its elevated position, evidently from the hand of a painter who has not given much study to architectural details. Artistic and pleasant as were such drawings, the day for them has passed; photography has supplied their place, and, unless the real character and colour of the work can be given, preference may well be given to that substitute. Nos. 2 and 7 (sketches in Westminster Abbey), by John Croft, show careful work, but are weak. Nos. 3, 4, and others by Mr. I'Anson too slight for exhibition, may be accepted as giving some and sufficient notice of the curious but barbarous building, rather than architecture of Moscow. No. 34 (Townhall, Breslau) is more spirited and complete. The drawings by Mr. H. W. Brewer and Mr. E. Cole are altogether superior, and show, with the handling and eye of an artist, knowledge of architectural detail. No. 5, by the former, is masterly as a drawing, but the church and its furniture and rococo altar-piece (St. Andrew's, Ochsenfurth, Bavaria) are not worth the trouble bestowed on them; whereas the ancient synagogue at Worms (No. 10) is a good subject, well treated. No. 9, by Mr. R. J. Talbert, is a heavy and indifferent drawing. Mr. Coles's subjects are generally well selected, and delicately and ably portrayed. We have received much pleasure from his drawings of the interior of churches in Brittany, such as No. 12 in this exhibition, and another in last year's, the memory of which haunts us still. Mr. Phené Spiers is another accurate and delicate draughtsman, whose studies (Nos. 15, 24, 34, 35) neither pretend to, nor possess, similar ability to that we have described. We look for their result in the architecture of the future. The sketches by the Rev. J. L. Petit (Nos. 18, 20, 21) are altogether of another calibre. They are the work evidently of an amateur, and not of an architect nor artist. His aim has been to grasp principles of composition and colour, and his drawings have the freshness of truthful effect, of rapid sketches on the spot, unspoiled by subsequent elaboration. The above are the principal coloured architectural drawings from ancient and existing buildings, and these have been rightly congregated together by the hanging committee, as an interesting and valuable department of the exhibition. We trust, on a future occasion, to find more competitors for its honours. In another part of the exhibition is a collection of slighter and more practical sketches, among which, however, are hung two beautiful drawings, No. 135 (Hotel de Ville, Ghent), and No. 136 (Palais de Justice, Rouen), by the late J. S. Cotman. Nos. 120 and 121 are two frames full of pencil sketches, by Mr. George Patrick, hung, not unfairly, we think, too high to be examined. Below these are five powerful and truthful (but not very delicately finished) drawings by Mr. John P. Seddon, being studies in Germany. Among them may be mentioned No. 123 the noble twelfth century font of the cathedral at Limburg), No. 124 (a late Gothic font at Bingen, with some excessively comic animals at its base), No. 122 (a beautiful fountain at Sayn), No. 114 (a carefully measured plan of the chapel at St. Martin's, at Cobern, with its pavement of Mosaic). Nos. 116 and 117 are two frames containing pencil sketches, by Mr. T. H. Watson, which are pretty rather than careful—good notes for his own use rather than edifying to others. The same may be said of the sketches in frame No. 126, by Mr. R. Phené Spiers, but not of his clear and complete drawing of a Mosaic pavement in an old house at Cairo (No. 127). Next we may turn to the architectural designs, thankful to the hanging committee for their judicious grouping, by which one's labour is greatly facilitated—for we find competition drawings generally by themselves, the Mediæval works arranged together and fairly subdivided into ecclesiastical and domestic, interior and exterior views, &c., in such a manner as to invite comparisons. Thus No. 40 (the interior of St. Charles Borromeo's Church, Ogle-street, Marylebone), by Wilson and Nicholl; No. 41 (interior view of Conventual Church of Sisters of Notre Dame, Liverpool), by M. E. Hadfield and Son; and No. 46 (interior view of the Church of St. John, Torquay, Devon), by G. E. Street, hang side by side, as if to challenge each other. The first of these is a quiet and beautifully tinted drawing, with the light well concentrated upon the altar. A rood group, standing on the easternmost tiebeam of the roof, is backed by the deep and sombre blueish greys of the enriched bay over the sanctuary. The form of the undecorated part of the ceiling is plain to baldness, and its overhanging soffit at the eaves is unpleasantly rigid. The clerestory might belong to a barn, being composed of plate-traceried couplets of the meanest description; but the arcade, with its banded columns and plain archivolts of two orders, relieved by coloured voussoirs, is effective; and the east end, with its rich, delicate, and well-treated altarpiece and wall arcade of seven arches above, is exceedingly happy. There is, however, in all this so evident a sacrifice of the upper half of the interior of the building to the aggrandisement of the lower, that it would appear that its frequenters were never expected to lift up their eyes, but to take for granted all above them as veiled in a holy gloom, which they ought not to attempt to penetrate. Mr. Street's drawing is in his well-known style, which seems to have much attraction for the profession and public as well, but which is, upon examination, vexatious and disappointing, as rendering it difficult to realise the design. Here it would seem that the design needed no concealment, and that the detail deserved full elucidation. The chancel seems unusually well proportioned and rythmical. The east window is a noble one, and the carved subject of the Crucifixion, suggested above the altar, better than the ordinary composition of an ungainly cross, studded with bosses of marble, but it is injured by the decorative arrangement on either side, which are quite out of scale with the rest. We do not admire at all the triplet of openings for ventilation over the chancel arch, and the detail of this is a perfect jumble of Early English and Decorated work. Nor is the tub of a pulpit more to our mind. In fact, the clerestory window is the only redeeming feature of the nave, and that is marred by some whimsical conceits. In referring to the drawing by Messrs. Hadfield, we may group with it No. 47 (St. Hilda's Roman Catholic Church, Whitby), and No. 48 (St. Peter's Roman Catholic Church, at Doncaster), by the same firm; and would remark that they are simple and careful works, designed in a right spirit, but they do not show much power or invention. The interior views are preferable to the exterior. In the façade of the church at Whitby there is a want of unity between the five small lancets over the porch and the great sept-foiled circle in the gable, and a lankiness about the turret that not even the reticence shown in the expanse of plain space of walling below can redeem. In No. 13 we have the reredos for the church of SS. Philip and James, Merrifield, Antony-in-East, by Mr. W. White, in which we are forced to confess that the very small modicum of art proposed in the lamb seen in the centre and figure on either side is out of proportion to their canopied framework, and that the detail of the latter is crude and unpleasant. In No. 52 we have an ambitious drawing of the interior of St. Mary's Church at Kensington, by S. Goldie, architect. Both drawing and design are meritorious. The columns to the arcade, high based, banded, and with richly carved capitals, are the best portion; the arches they support are bald, while the base of the vaulting shaft unduly bears upon and spoils the capitals. The square pilasters of the clerestory are un-Gothic and unpleasant, and the trefoil-shaped ceiling of the roof more curious than satisfactory. The corbels of the chancel arch are quite out of scale with the rest, but the proportions of the apsidal choir beyond and the delicate gilded tabernacle work of the altar-piece, albeit work of a later type, are graceful and effective. No. 56 is a slighter sketch of the design of a proposed new Catholic Church at Wakefield, by the same architect, which has several good points. In No. 58 we have geometrical drawings of Christ Church, Parkgate, Yorkshire, by Mr. W. White, in which we notice, with much character and dignity, such as are always to be found in the works by this architect, a curious disregard for beauty of form. Notice the substantial, no doubt, but ugly construction of the roof. The offensive treatment of the inside arches of the aisle windows, the poverty of the east window, and meanness of the bell turret upon the angle buttress. Of designs for churches submitted in competition we have some interesting sets, viz., for Dorchester, Great Yarmouth, and Lincoln. These, however, we are obliged to defer until next week.

ROLLED IRON BEAMS AND JOISTS.*

IT is not many years since the rolled beam and joist were first introduced, the only description of solid girders in use being those of cast iron. By solid girder is to be understood a beam cast or rolled in one entire length, and so distinguished from built-up girders or those consisting of horizontal and vertical plates, united by angle irons. Cast-iron beams, except for very insignificant spans, may be regarded almost in a light similar to that of timber bridges. The well-known treacherous nature of the material, the peculiar difficulties attending the casting and foundry operation in connection with large molten masses, and, more than all, the fatal and unfortunate accidents that have ensued from the fracture of large cast-iron beams, have placed a ban upon them that will never be removed. The culminating blow that this material received was undoubtedly the breaking of the beam of the Hartley Colliery engine, and which resulted in the death of a large number of our mining population. Mr. Fairbairn, in the last series of his excellent work, alludes especially to the substitution of wrought iron for cast in this particular instance, and gives a formula for calculating the breaking weight of a similar beam constructed of wrought iron. It is not too much to assert that no engineer who was worthy of the name would ever think of countenancing the employment of cast iron upon any but a very small scale.

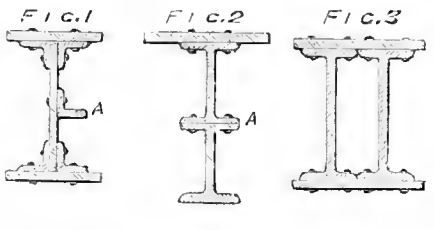
Solid cast-iron beams being therefore in-

* Third Edition. "Sections and Plans, Rolled Iron Joists, Patent Solid Flange Girders, Patent Fireproof Flooring," &c. W. and T. PHILLIPS, Engineers and Iron Contractors. London: Waterlow and Sons, Printers, Carpenter's Hall, London-wall.

adequate to meet the increasing demands of railway traffic, the exigencies of construction of iron ships, roofs of large spans, and numerous other structures, the built-up wrought-iron girder became its substitute. Although recognising the many advantages with respect to lightness and strength possessed by this new type of construction, yet engineers were not blind to the fact that it also possessed some disadvantages as well. The two principal of these are the skilled labour required in fitting together and riveting up the various component sections, and the loss of material incurred by the necessity of the connections of so many different pieces. As the strength of any bar, rod, beam, or girder is in direct proportion to its sectional area at any given point, and since its greatest strength is never more than the strength of its weakest part, it is clear that, if the area at its weakest part is less than that at any other, there is a loss in the difference. Now, as the punching out of rivet holes weakens the metal and diminishes the sectional area of metal available for calculating the strength of the girder by the area of the holes, it is manifest that the extra metal, where there are no holes, is so much dead weight, and consequently a loss. In fact, if we call A the gross area of a beam—that is, its sectional area—without making any deduction for the rivet or bolt holes, and A^1 the nett area or area available for calculating the strength of the girder after deducting all holes, then $(A - A^1)$ represents the loss of metal incurred by the built-up system, and the greater the difference between A and A^1—that is, the more holes that are necessary for riveting together the various parts of the girder—the greater will be the economical disadvantage of the principle. We have now said enough to demonstrate the superiority of a solid rolled section over a built-up one, for in a perfectly rolled beam the gross area and the nett are equal; or $A = A^1$, a condition which ensures the maximum of economy. Sometimes it is necessary to punch or drill a few bolt holes here and there, to attach other pieces of iron to the flanges of beams; but even this comparatively harmless operation may frequently be dispensed with by the employment of hook-headed or any bolts which can be made to clip over the edge of the flanges and hold everything tight. Mr. Phillips, in his estimates of the relative cost between rolled and cast-iron beams, is borne out by Mr. Fairbairn, who arrives at the same conclusion, that the wrought-iron is, all circumstances considered, more economical than its fellow. There is no question that a solid flanged girder is much stiffer, laterally, than a plate one. This is owing to the greater thickness of the web, which also has the advantage of being uniformly thick instead of being composed of alternate thin and thick sections, as is the case of a plate web, which consists of boiler plate stiffened at intervals by vertical tee or angle irons. Our statement is corroborated by an experiment which showed that a solid rolled girder, weighing 1,040lb., bore 16 tons without giving way, when a plate beam, weighing 1,380lb., yielded laterally with a weight of 14 tons. The span in both instances was the same. We are not surprised that the result of the combination of less material with less workmanship should effect a pecuniary saving of 40 per cent.

The question of the distribution of the material is one which has never been properly attended to from the earliest times down to the present. Architects, builders, engineers, and others engaged in the various branches of the constructive arts appear to have been satisfied provided the material was actually there, but cared little whether it was absolutely wanted in the position in which it was placed or whether it might not have been better situated elsewhere. We are forcibly reminded of this fact by the first examples of cast-iron beams, which were made with equal top and bottom flanges, and it was not until the laborious and accurate experiments of the late Professor Hodgkinson that the correct form was discovered, and the relative proportions of the upper and lower flanges finally determined upon. Mr. Hodgkinson commenced his experiments by taking the metal away from the upper and transferring it to the lower flange until the best form was arrived at, and the relative proportions of the two members became nearly as 6½ to 1. Much of the success achieved by Phillips's patent girders is undoubtedly due to the proper distribution of the material, adding it to those parts where it is required, and subtracting it from those where it is not wanted. Cast iron being considerably stronger in compression than in tension, more material is needed in the bottom than the top flange, and it is rather curious that, although this fact was known long before the time of Mr. Hodgkinson, yet no one ever reasoned the subject out, and applied the result to improving the form of cast-iron girders. Provided they put enough material in the beam, and that it was strong enough, it was clearly a matter of not the slightest consequence whether there was ten times the absolute necessary amount of metal or not. But with increased prices for labour and material, and, in fact, everything else, the adoption of a more scientific and economical system became imperative, and those having the control of funds intended for the execution of architectural and engineering works began to seriously examine the items of expenditure. The strength of cast iron and wrought iron being exactly opposed to each other with reference to tension and compression, wrought-iron beams have to be strengthened upon the top flange in order to equalise the resistance to the two descriptions of strains, which act, the former upon the lower and the latter upon the upper flange. By the addition of an extra plate upon the top flange, together with the other advantages possessed by the rolled section, Messrs. Phillips's patent girder affords a ratio of 45 to 33 in strength compared to a plate girder. There is one point worth remarking respecting these patent girders, which accounts for their lateral stiffness. Let fig. 1 represent the section of an ordinary plate girder built up in the usual manner. When the girder has a considerable depth it is a common practice to rivet an angle iron A along its whole length to increase the rigidity. The same arrangement is also frequently adopted in lattice girders. If we refer now to fig. 2,

FIG. 1 FIG. 2 FIG. 3



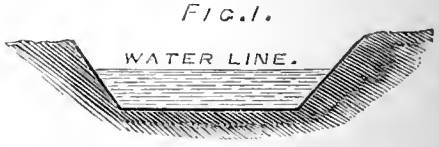
which represents a section of one of the double patent girders, it is at once perceptible that the projecting rib A, formed by the union of the bottom flange of the one girder and the top one of the other, answers the same purpose as the angle iron in fig. 1, only much more effectually, being much thicker, and extending upon both sides of the web. Fig. 3 shows a plan of manufacturing a box girder by the use of the rolled sections, and we would suggest that double the number of rivets should be put in, and not merely those shown in outline. There is no fear of diminishing the nett area, as they could be made easily to break joint, and the line of fracture across the breadth of the top or bottom flange would still remain the same. The advantages of the application of the rolled girder to fire-proof constructions are too well known to need any comment, and the public will soon have an opportunity of witnessing their adoption on a very extensive scale in Her Majesty's Theatre, now in the course of erection. It will scarcely be credited that we have known instances where built-up girders have been constructed, containing scarcely two square inches of sectional area with flanges, the workmanship being the same as would have riveted up ten times that amount of material. Rolled joists must supersede eventually all other girders, except those of a very large pattern constituting our great railway bridges, and it is perhaps only a question of time, of improvement in our iron manufacture, and of skill in combination, for us to witness them applied to even those purposes.

USE OF ASPHALTE IN CONSTRUCTION.—III.

BEFORE proceeding to the subject of asphalte roofs, it may be stated that there are several other useful applications of it, besides those we have either fully described or incidentally alluded to in our previous articles. It is, in fact, capable of rendering the various portions of any structure perfectly watertight, provided the structure combines in itself the necessary elements of strength and solidity. As a lining for reservoirs, tanks, and ponds, it not only effectually prevents all infiltration or escape of the contents, but also maintains them in a fresh and pure condition by the property it possesses of checking and arresting the growth of aquatic plants and parasitic weeds. Generally speaking, asphalte may be applied to any surface free from oily or greasy matter. The presence of ingredients of this description renders the asphalte soft, as it is more or less an absorbent of them. When treating of asphalted footpaths we drew attention to the fact of their frequently becoming plastic, and even sticky under foot, and mentioned that such a condition was due either to bad material, bad foundation, or bad workmanship. While there is no question but that an unsound and uneven foundation will spoil the best asphalted surface ever laid down, yet on the other hand no foundation however solid, and no workmanship however perfect, can compensate for the use of bad and defective materials.

Very much of the ordinary asphalte is composed of nothing more than common gas tar mixed up with small calcareous particles and fine gravel. This of course cannot be expected to afford a durable or even surface, and instances of its total failure in various situations are not wanting. As has already been described in discussing the theory of the formation of asphalte, the proper material must have a natural source, similarly to that now shipped in large quantities from the mines of Pyrimont Seyssel, in the Jura mountains, by the Seyssel Asphalte Company. One special advantage possessed by a naturally formed asphalte is that it is not liable to crack, and can consequently be laid on thinner layers or couches than other descriptions of artificially formed asphaltes and concretes. The economy both in labour and material might in some instances be very great, and worth considering in all cases. As an example let us take that represented in fig. 1, which shows a cross section of a portion of a canal constructed through a cutting in porous ground. To prevent the escape of the water into the substratum it is usual to line the bottom and slopes of the canal with puddle, a material not always readily obtainable. In the situation shown in fig. 1 the puddle

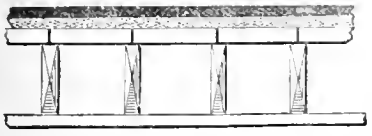
FIG. 1.



would have to be at least 1ft. or 18in. in thickness. But by the employment of the Seyssel asphalte a thickness of 1in. or 1¼in. would be sufficient, and would render the whole area watertight in a manner much superior to that obtained by ordinary puddling. Having discussed the application of asphalte to nearly every possible purpose of utility, with one exception, we now come to the subject of roofs, constituting that exception. A great difference with respect to the constructing of a

foundation or substratum upon which to lay the asphalte will be apparent here. It is no longer a case of simply forming a solid, firm, and even under surface, but of constructing an actual piece of a building. Although perhaps the best description of roof to which asphalte may be applied is a perfectly flat one, yet it can be equally well adapted to almost any pitch, and has proved perfectly successful in the case of a pitch of three to one. The construction of flat roofs is very similar to that of footpaths, which we have already described, only tiles are generally substituted for the sheeting. In fig. 2 is represented a

FIG 2



section of a flat asphalted roof. Joists of timber are laid at the ordinary distance apart, tiles placed so as to span the intermediate distance, and the covering completed in the ordinary manner. A thin layer of very fine concrete must be laid under the asphalte, as the heat suddenly applied might be injurious to the tiles. There is no absolute necessity for employing tiles, as the joists may be covered with well-seasoned sheeting laid in the same manner as for a floor, and well trussed or bridged together. At the new City Prison, Holloway, an excellent roof has been constructed by the Seyssel Asphalte Company, which we personally inspected. It is of a superior description to the construction we have mentioned, being supported by tiles resting upon the flanges of cast-iron girders, and forms a very solid piece of work. Although executed nearly twenty years ago it is as sound as when it was first put up. The greater part of the roof is in large rectangular flats, but portions are laid upon rather a sharp pitch. In the latter case arches are turned in tiles, the only difference being that a little more care is bestowed upon the laying of the asphalte owing to the tendency it has of not distributing itself so evenly as in the instance of a perfectly flat surface.

Considering that a very inflammable substance is one of the chief ingredients in Pyrimont asphalte, it might be reasonably imagined that it would be a dangerous description of roof covering to employ, with respect to its liability to take fire. Experience has not only disproved this assumption, but has demonstrated incontestably the very reverse. It has been a subject of remark that at all fires, those roofs that were constructed of Seyssel asphalte, instead of encouraging or feeding the flames as it were, actually did the very reverse and aided to extinguish them by literally smothering the rising blaze. This fact was especially noted during the great fire at Hamburg some years ago, and the authorities in charge of the British Museum took the precaution, very properly, but in this case unnecessarily, of testing whether the Pyrimont asphalte was combustible or not before they allowed it to be used in the construction of the dome of the new reading room. Similar doubts have been entertained respecting its suitability for warm climates, but the temperature to which it may be exposed is of no consequence. By slightly varying the relative proportions of the ingredients it can be adapted for work in any climate, whether the extreme temperatures are excessive or whether an average mean is the prevailing one. In our own country asphalte roofs undergo a great variation of temperature throughout the entire year, and in corroboration of this assertion, we quote rather a curious instance of the statistics of temperature. At the prison at Holloway, to which we have already alluded, a register has been kept of the daily temperature for the last fifteen or sixteen years, and it presents the following record with regard to Christmas day, 1860. At 6 a.m. the thermometer was down to 10 deg. Fah. At 8 o'clock it rose to 13 deg., at 10.30 to 17½ deg.; at noon it marked 25½ deg.; and at 2 p.m. the maximum of 30 deg. was registered. Assuming the extreme summer heat to have reached as high as 100 deg. the Holloway prison roof has consequently undergone a variation of temperature ranging through 90 deg. Fah. without evincing any sign of being affected by either of the extreme limits. Some excellent specimens of roofs executed in Pyrimont Seyssel asphalte came under our notice at the Tower, and upon one of the flats heavy guns are fired, which constitutes an ample proof of the solidity and firm support it is capable of affording. At Windsor Castle, Buckingham Palace, Guy's Hospital, Woolwich Barracks, and numerous other public and private buildings, the Seyssel asphalte has been applied with signal success. From our own observations, which have been very extensive, this material appears to be totally unaffected by alternations of temperature, and completely impervious to the ordinary attacks of the weather, and might be almost said to constitute a species of everlasting protection against heat, cold, humidity, and wear and tear.

MONSIEUR LAMEIRE'S DRAWINGS AT THE ARCHITECTURAL EXHIBITION.

SECOND NOTICE.

I WILL now give a description of M. Lameire's nine large drawings. No. 196 gives us a large drawing of the apse, showing our Lord on horseback surrounded by the armies of heaven. The crowns upon his head are very ingeniously managed as small circles attached to various parts of the hair; the face, however, gives no indication of being like a flame of fire, nor are his garments spotted with blood. 2. A plan showing the vaulting. 3. A plan showing the pavement. It should be observed that neither of these embrace the aisles.

No. 194. The reliquary of St. John—a marble chest placed on brackets evidently over an altar; on the top of the chest is a bronze eagle trailing his wings, a new idea and well carried out. Of course this reliquary could not be supposed to contain a personal relique of St. John the Divine. See the tradition of his death in the "Golden Legend." This frame also contains three sections of the porch, a perspective of ditto, and a large drawing of the figures on the top of porch. These consist of an angel in Byzantine costume on horseback, holding the labarum. At the feet of his horse are colossal heads of the four divinities that Christianity has conquered—viz., Jupiter as Europe, Buddha as Asia, Isis as Africa, and Huitzilopuchtli as America. It is much to be lamented that our artist has omitted to give us his idea of this latter divinity. In the current number of *Notes and Queries* (May 22) will be found a description of this idol, highly suggestive in an art point of view.

No. 199. A section of the building from the east end to the third bay of nave. No. 198. A perspective of upper part of one bay to a large size. We learn from these two drawings that M. Lameire proposes to confine his glass to grisaille work, as ought almost always to be the case in highly coloured buildings, otherwise the colours of the glass are apt to injure and weaken the colour of the paintings.

No. 192. Perspective of apse and vaultings of central bay. No. 193. Details of ditto. These two drawings deserve careful study, both for the iconography and for the decoration.

No. 197. Elevation of one side of ciborium. No. 200. Perspective of ditto. The ciborium is one of the most successful designs of the whole scheme. Around the altar are four pillars supporting balls of lapis lazuli; upon each of these balls stands an angel, clad in Byzantine costume, such costume as we see in the churches of St. Maria d'el Amiraglio, at Palermo and elsewhere. The heavy jewelled garment trails from behind upon the lapis lazuli ball, and with the wings, which are excellently treated, give the angels the appearance described by Dante, "Divini Uccelli." These angels support a velarium by each of the corners. In construction some other way than the rings shown on the drawing would have to be adopted or the velarium would certainly fall; but, however this may be, the design is most beautiful, and is further enhanced by the fringe of gold pendants and crystal balls. The lions at the bottoms of the pillars are by no means so successful; the backs are too much curved and suggest the idea of weakness.

No. 191 contains two bays of the frieze, extending from Clovis to St. Louis.

No. 195 ditto, beginning with Joan of Arc and ending with Napoleon.

Such are the drawings of M. Lameire, and, as such, one would naturally expect to find a crowd of English architects and amateurs round them all day; that a railing had been placed to prevent the said crowd pressing too closely; that people were waiting in Conduit-street before the doors were open; that young students were begging or borrowing money to come up from the provinces to have the benefit of their study. Alas! if anyone imagines this state of things he imagines very wrongly. During the time these notes were made, involving four separate visits at different periods of the day, there were at no time more than three or four visitors in the room—more frequently, indeed, there was only one.

Upon inquiry of the attendant it came out that on Tuesday nights, the only ones on which the exhibition is open, there is an attendance of some 18 to 20 visitors, principally, so I was informed, architects' assistants. The additional information was also volunteered that these Tuesday night visitors took a good deal more interest in the exhibition than did the day visitors, and that they both sketched and took notes of the French drawings.

Now, figure drawing and coloured decoration are the most, or two of the most, difficult parts of an architect's profession; and we all know how awkward it is for the younger members to be in advance of the elder members in any profession. Slowly, but surely, day by day, the art architect is making good his position, he is gradually being more appreciated by the public, who, on its part, is also gradually becoming more educated (thanks, above all, to South Kensington*) in matters of art. In a few years the same man will not be paid by a percentage on decoration, as he is now for a workhouse; nor will he be expected to do dilapidations and surveys at the same time that he designs sculpture for a cathedral.

When the time does come, as come it will, it is not improbable but that some of those architectural assistants who now spend their evenings in studying M. Lameire's drawings may be moved into high places, while those gentlemen who prefer the comforts of their club or suburban villa to such mental exertion may find themselves left out in the cold.

W. BURGES.

NEW BUILDINGS FOR THE PUBLIC DEPARTMENTS.

THE report of the Commission appointed by Treasury minute of November 23, 1866, to inquire into the question of accommodation of public departments was issued on Thursday last

* South Kensington Museum must be carefully distinguished from South Kensington School of Art. While the latter has been a comparative failure, the former deserves almost unmixed praise. The museum now quite equals if it does not beat, that of the Hotel de Cluny; the only thing wanting being a room where students could have the objects out of the cases. In the library, a book is produced in five minutes, to obtain which would take half an hour in the British Museum; and there is a most excellent catalogue of art books in preparation. Why should not South Kensington obtain M. Lameire's drawings; or, if he be unwilling to cede them, why not have them copied by the artist?

week. The committee state that they have thought it expedient to consider :—

"The number of storeys of which it would be convenient that public offices should consist; the space now occupied by each department, and that which when its various offices are concentrated will probably be required; the departments which require concentration in the neighbourhood of Whitehall, and those which may conveniently be housed in Somerset House or elsewhere; the most advantageous mode of grouping the departments at Whitehall; the best site in the neighbourhood of Whitehall for the concentration of these departments; the probable cost of purchasing that site, and erecting thereon suitable buildings; and the return which may be expected from the sale of existing offices and from terminating existing leases of houses used for office purposes. In prosecution of our inquiries under the above heads, we have derived great assistance from Mr. Scott and Mr. H. A. Hunt, and have taken the evidence of the heads of the great military departments' report. We likewise found it desirable to refer the question of space required for each department to a sub-committee of our body. The sub-committee recommended that the public offices should consist of four floors available for office accommodation, and we adopt their recommendation. Being of opinion that the close approximation of the military and naval departments is highly desirable, we directed our early attention to the best mode of accomplishing that object; and attaching weight to the reasons assigned by the Commander-in-Chief for retaining the Horse Guards on its present site, we recommend that the War Department should occupy the site now appropriated to Dover House, and the offices which lie between it and Downing-street. With respect to the site of the future Admiralty, we have considered the desirability of a new building providing for office accommodation and official residences being erected between Parliament-street and the River Embankment; and though of opinion that such a plan has very considerable advantages, we think, on the whole, it is better that the Admiralty should remain on its present site, augmented by the addition of the present pay office. The subjoined figures will show that the space thus proposed to be allotted to the great military and naval departments is sufficient for their estimated requirements :—

	Ft.
Building space required for Admiralty by sub committee's report	44,000
Add for three official residences	15,000
Total of	59,000
Building space required for Horse Guards	19,400
For War Department	62,000
Total of	81,400
Building space available on Admiralty site	60,000
Building space available for Horse Guards and War Department	87,000

The total requirements of these departments are thus shown to be 140,000ft., and the available space 147,000ft., leaving a surplus of 6,600ft. available for future growth.

"Should this recommendation be adopted, it would seem to follow as a most convenient if not necessary consequence, that the civil departments should be all concentrated in a line with the military and naval departments, on the area bounded by Downing-street on the north, Great George-street on the south, Parliament-street, widened by the incorporation of King-street, on the east, and St. James's Park on the west.

"The advantages attaching to such an arrangement are great, and may be summarised thus:—All the public offices would be accessible to the public from one grand thoroughfare on their eastern side, while intercommunication between them all being secured without crossing any public street, they would on the western side face the park. It would thus be actual concentration, combining accessibility with quiet. All necessity for subways would be avoided. The Horse Guards would remain untouched, and the Treasury and the offices adjacent need not be disturbed until the buildings destined for their final accommodation are ready. The question of site, and the position thereupon of the great military departments being thus disposed of, we next would direct your lordships' attention to those civil departments which we think ought to be concentrated in the neighbourhood of Whitehall, and to the most advantageous mode of so locating them. We agree with the opinion expressed by our sub-committee, that the Colonial and Home Offices, with their respective dependencies, should occupy the vacant space of the quadrangle now partially occupied by the Foreign and India Offices. Assuming the frontage of the new street to be as proposed by Mr. Scott, sufficient space can be secured for the requirements of those two secretariats, and we are of opinion that those offices should be erected without delay. The space required for these departments is 46,950ft., and the proposed site will afford a building area of 46,000ft.

"The other civil departments which it appears to us expedient to concentrate in the neighbourhood of Whitehall are—1. The Treasury, the Office of Works, the Office of Woods, the Audit Office, and the Paymaster General's office. Their requirements may be estimated at 54,000ft. 2. The Council office, the Board of Trade, and the Education Department—their requirements amount to 38,650ft. 3. The Poor Law Board, requiring about 8,000ft. 4. The Civil Service Commission, requiring 10,000ft. And 5, temporary commissions, a fluctuating but growing service, for which, looking at the general composition of such commissions and their present and probable future number, we think a certain amount of accommodation in the neighbourhood of the public offices and the Houses of Parliament ought to be found. From a paper submitted to us by the First Commissioner, and drawn up by Mr. Austin, on whom has of late years devolved the duty of providing accommodation for such commissions, it would appear that their requirements will probably amount to 28,225ft.; as, however, it is not necessary that accommodation should be found in this neighbourhood for all such commissions, and as by means of the Thames Embankment, the proposed railways, and the steamboats, easy communication will be obtained with Somerset House, where a considerable amount of space will be rendered available by the contemplated removal of various branches of the public service and of the learned societies now located there, it will probably be sufficient to allow 15,000ft. for this service, bringing up the space required for the departments proposed to be placed on this block to 126,650ft., the space available amounting to 133,000ft., thus showing a surplus of 6,350ft. It may be convenient here to call your lordships' attention to the fact that in this calculation no provision has been made for official residences for the First Lord of the Treasury and the Chancellor of the Exchequer.

"When the plans of the new Foreign Office were under discussion it was recommended by the Select Committee of the House of Commons that the Secretary of State should be provided, not with an official residence, but with a handsome suite of rooms, in which receptions could occasionally be held by every minister; this has since been done; but it appears to us that a similar arrangement might conveniently be made with respect to the First Lord and the Chancellor of the Exchequer, by which they might be provided with rooms applicable to the double purpose of official and social receptions.

"We now come to consider the probable cost of purchasing the site and erecting thereon suitable buildings. The total cost of purchasing the property before referred to, but exclusive of that already acquired, is estimated at £1,443,920. In estimating the cost of erecting the necessary buildings, we assume that none of the existing offices will be allowed to remain except the Horse Guards, and possibly that part of the Treasury buildings facing the parade. With these exceptions, we are convinced that neither real economy nor the public advantage will be consulted by retaining any of the present inconvenient and badly arranged offices. It is calculated by Mr. Scott that for buildings of this character, including their fixtures, £6 per square foot should be allowed. The total building space required being, in round numbers, 313,000 square feet, the cost of buildings and fixtures would be £1,878,000, making, together with the price of the ground, a total first cost of £3,321,920.

"We now come to consider, lastly, the probable returns from the sale of existing offices, and the termination of the system of hiring houses for public purposes. These returns will estimate as under :—1. Sale of the Board of Control, £50,000. 2. The sum represented by the capitalisation of the annual value of premises now occupied by public departments, but which would hereafter be accommodated in the proposed new buildings, cannot well be estimated at less than £175,000, making a total set-off of £525,000 to be placed against the total first cost of £3,321,920, leaving a nett cost of £2,796,920.

"Whatever may be the expense of erecting the new public offices, the work is intended for the convenience and the ornament of all future generations. Heretofore little has been done towards this object, and now it has to be done once for all. The charge ought, therefore, to be spread over a long period, like that for the new fortifications. Otherwise the present taxpayers would defray the whole expense, and a work which ought to be vigorously prosecuted at several different points, in order to avoid serious delay and inconvenience, would be subjected to the uncertain contingencies of the Chancellor of the Exchequer's annual Budget. All the circumstances of this great undertaking suggest the expediency of providing a special agency for the superintendence of the work. The sum to be expended will be necessarily large. Several years must elapse before the new public offices will all be completed. The claims of the great administrative departments will have to be adjusted and controlled in the interest both of mutual convenience and of indispensable public economy. And experience has proved that, unless certain general rules founded upon an enlarged knowledge of official requirements are observed in planning the interior of public offices, even the most liberal expenditure will not be productive of satisfactory results. We suggest that a special commission should be charged with the superintendence of the work under the directions of, and in immediate correspondence with, the Treasury, and that this commission should be appointed by Treasury, and should consist only of three persons, of whom the First Commissioner of Works for the time being should be the President. We have hitherto considered the matter referred to us simply in connection with the requirements of the public service, but we think it right, in conclusion, to draw your lordships' attention to a public improvement, long contemplated, which we think will naturally follow the adoption of the recommendations we have made. We allude to the removal of St. Margaret's Church. When a magnificent street, 150ft. wide, has been opened from Whitehall to Westminster Abbey and the New Palace, it will become more than ever necessary to remove what will then be the only obstacle to the Abbey forming the termination of a vista which will probably be unsurpassed in any European capital. A convenient site for the church, we may point out, will be found ready at hand on the ground now being acquired by the Government to the west of the Victoria Tower. The only additional expense, therefore, caused by this completion of a great public improvement would be the sum requisite to build a new church on the proposed site. For that object a sum of £26,000 would probably suffice."

ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of this Association was held on Friday last, when the Rev. Edward L. Cutts delivered a lecture on "Early Brickwork." Mr. Cutts said that Mr. Gladstone some years ago had stated that he looked upon the inventors of the oar, the wheel, and the plough as the three first and greatest benefactors of the human race. To this category he was certainly disposed to add the man who first invented the method of making bricks. Probably the first way in which men obtained shelter was by the use of skins stretched over branches of trees. This he might call the commencement of timber architecture. Where timber was scarce men probably dwelt in caves, and this, without doubt, suggested the use of stone as a building material. But it was to the inhabitants of districts where stone was not to be found, and where timber was scarce, that the invention of making bricks proved of the greatest use. The subject of brickwork was universal; it embraced the period since the building of the Tower of Babel to the present time, and extended all over the world. Premising that he intended to confine his remarks to early brickwork he proceeded to describe the characteristics of Roman bricks. Not many examples of Roman buildings were left. At Colchester the town wall was probably Roman and one of the old gates. When the Romans retired from Britain nearly all the towns they had built were destroyed during the anarchy of the Saxon invasion. When civilisation again appeared the Saxons, in all probability, constructed their buildings (many of which existed) of the Roman bricks of which the demolished Roman towns had been built. About this there

was a difference of opinion. Mr. Parker and others had suggested that both Saxons and Normans made their own bricks, but in his opinion it was not so. Of brick buildings of this or a little later period we had Brixworth Church and part of St. Alban's Abbey, of which it was recorded that the bricks used were obtained from the Roman town of Verulam. At Bradwell-on-Sea a church existed of which it was almost impossible to say whether the brickwork was Roman or Norman. The priory church of St Botolph, Colchester, was the earliest instance of an attempt to use brick artistically, and it had been attended with some success. The walls were of rubble stone of a dark grey colour, and the arcades of red Roman brick, producing together a very agreeable effect. Examples of artistic brickwork of this period were, however, very few. Coming down to Mediæval times we found for the first time moulded bricks. About this time Hull became the metropolis of the woollen trade, and the advent of many Flemings probably caused the introduction of brickwork there. At Trinity Church, Hull, the two chancel side walls were of bricks, and their dimensions, 10½in. by 5½in. by 2in. proved that bricks were then getting smaller than those made by the Romans. Bricks also about this time, according to Mr. Street, were used at King's Hall, Cambridge, and cost 6s. per 1,000. It was, however, in the fifteenth century that brick became really fashionable. It was then used for Hampton Court, St. James's Palace, and many provincial halls and residences. Soon after this it became used entirely, and a little later the fashion was introduced from Italy of using terra cotta instead of stone for mullions of windows, pediments of doorways, &c. One curious thing with respect to the brickwork of this period was that they covered the work with a thin coating of plaster, and then worked it into designs to imitate masonry, or even painted it to imitate flintwork. The lecturer then proceeded to consider the bearing of these early examples on modern practice. He thought that brick, though not to be used where stone could be more advantageously employed, was by no means to be despised. How was it that ancient brick buildings satisfy while modern examples altogether dissatisfy the eye? He thought the shape of modern bricks had a great deal to do with this. Roman bricks were of a much better shape; moreover they were used with no regular bond and with very thick mortar joints, and walls thus built were certainly more picturesque than those of modern times. Brick was now used in such a staring way. To obtain a better effect the mass of the building must be broken up by making some parts advance and others recede. Panels also might be introduced, the old octagonal forms might be employed to advantage, and the sky-line might be broken by pinnacles or gables. The effect of stone dressings was by no means good, the colours seldom harmonised, and an appearance of weakness of construction suggested itself. He thought the use of terra cotta a mistake, it was nearly as expensive as stone, with a very small portion of the effect produced by the latter material. Stringcourses, mouldings, and other ornaments, whether in stone or terra cotta, should be of plain and simple geometrical patterns. The use of coloured bricks, a practice lately increasing, was, in his opinion, at the best a very hazardous experiment. Of modern brick churches in London the best examples were All Saints', Margaret-street; St. James-the-Less, Westminster; St. Saviour, Hoxton; and St. Peter's, Vauxhall. Brick would, doubtless, continue to be, at least in London, the material chiefly used for houses, and he thought that a study of early English examples would afford principles by which a common house might not be quite so ugly an object as it was at present.

Mr. R. W. Edis, in proposing a vote of thanks to Mr. Cutts for his lecture, said he by no means agreed with him in his opinion that the Saxons and Normans used the old Roman bricks. He thought that, like many architects of the present day, they were simply imitators and followed the examples of their immediate predecessors. He thought if our bricks were thinner they would be greatly improved. One great objection to the use of brick in large cities like London was its liability so soon to get dirty and lose its colour. Another difficulty was the contempt brick was held in by architects' clients, in consequence of their desire for more showy materials. He feared there was very little hope of London shopkeepers becoming contented with simple, honest brickwork.

Mr. Blashill, in seconding the vote of thanks, said that in his experience brick was most generally used in the eastern parts of England. In many parts in the west the very name of bricklayer was unknown, and such a thing as a brick had yet to be introduced. This was in consequence of the abundance in those parts of stone suitable for building. He thought that the very common practice of using bricks with Bath stone dressing was by no means commendable. Red brick and dressings of red Mansfield or sandstone afforded a much better effect. He did not think it would be well to return to the earlier sizes of bricks. Bricks of the size now in vogue, though of bad material, were most advantageous and least expensive.

Mr. Redgrave said Mr. Cutts had only spoken of red bricks, and he should have liked to have heard something from him as to the existence of examples of white brickwork. He was quite of opinion that the Saxons had used old Roman bricks, for in many instances Roman names and marks had been found on bricks in Saxon buildings. He thought the use of terra cotta by no means wrong. Where it could be used for small work it was superior to stone. He would like to know whether the brick tracery in the early examples quoted was cut or moulded. He believed that the bricks in the chimneys at Hampton Court Palace were cut and not moulded.

Mr. Edis said the bricks at Hampton Court referred to by Mr. Redgrave had been re-cut within the last twenty years.

Mr. Redgrave said he had seen some of the old work, and he was quite of opinion that it had been cut and not moulded.

Mr. Lacy Ridge thought that the wide mortar joints of ancient brickwork had something to do with the better effect produced. About the time of Queen Anne they used very small bricks placed as closely as possible, with very thin joints; but unfortunately we had adopted the system of very thin joints and had only very bad bricks. He thought the abominable practice of tuck-pointing was to be condemned.

Mr. Birch said that in the brickwork of the time of Queen Anne, referred to by Mr. Ridge, it was only in pilasters and panels that the thin joints were used.

Mr. Mathews referred to a building in Cannon street, opposite the Cannon-street station, now occupied by a telegraph company, as an example of modern red brick building. It had been rubbed down to about 2½in., and had to bond as well as it could with its backing, a practice he thought very far from commendable.

The President (Mr. R. Phené Spiers) thought that bricks were not used quite so early as Mr. Cutts supposed. He thought the earliest buildings were probably of mud, and that this was in some degree proved by the raking face peculiar to all early Egyptian buildings, adopted to give strength to the structure. In his opinion it was not till comparatively late that men thought of burning the earth they had been in the habit of using into bricks. He thought that with respect to a suggestion made as to panelling by Mr. Cutts, that panelling was hardly admissible in Gothic work; it was, of course, to be used with good results in Classic architecture. He did not at all agree with what Mr. Cutts had said about terra cotta, as, in his opinion, it was for the purposes that had been mentioned infinitely preferable to stone. Although the lecturer had only dealt with English work, he would very earnestly recommend to the members the study of Flemish and North German brickwork, as affording many very instructive and interesting examples.

Mr. Cutts briefly acknowledged the vote of thanks, and the meeting terminated.

PATENT CONCRETE FIRE-PROOF SLABS FOR BUILDING PURPOSES.

THESE slabs, invented by Mr. Nichol, of Regent's-circus, are formed of a combination of iron, concrete, and fibrous materials, made fire and damp proof. The strength and durability of these slabs have been proved to be equal to 9-inch bonded brickwork; they are non-conductors of sound, heat, cold, and damp. They are washable inside and outside, and the buildings of which they are constructed may be inhabited as soon as they are erected.

The buildings are constructed by means of skeleton iron frames preserved from rust, and filled in with the slabs, secured with bolts, with prepared felt between the bolted parts. The saving in cost is said to be 25 per cent, as compared with brick, slate roofs, and ordinary floors. The weight of iron in the triple cottage at Hampton, which is built on this principle, is under 3½ tons. The saving of space in the triple cottage is 90 superficial feet in ground, and 2,250 cubic feet in span.

The ground floors are damp proof, solid, and rats cannot penetrate them. The upper floors are waterproof, which prevents the ceiling being stained and throughout the building there are no spaces where dust or vermin can accumulate. The supports of stairs and the window and door frames, &c., are composed of iron, so as to have as little wood as possible in the building, that which is used being soaked in a fire-proof mixture. The new floors of concrete, on Captain Galton's principle of ventilation.

The advantages of these slabs as compared with other methods of building now in use are said to be as follows:—The great saving in cost and space effected by them in the construction of external walls, interior partitions, ceilings, roofs, and floors. They can be fixed by ordinary carpenters or plasterers; can be made of any thickness, and when of 1in. only they will suffice to keep out sound, damp, vermin, fire, &c., and at the same time remain unaffected by hot or cold temperatures. The exterior presents a stone-like appearance, and the interior surface is prepared suitable for papering or finished with a hard polished surface tinted with colour as fresco. They have the sanitary advantages of not absorbing water or damp, of presenting the surface declared to be requisite for hospitals, &c., that of being washable, and thus saving the necessity of frequent limewashing. This surface may be washed at any time with plain water.

Thus one of the greatest uses of these slabs will be to form the partitions in houses, especially in towns, instead of quartering or 4in brickwork, as it is practically proved that a partition 4½in. thick, formed of these slabs, is as durable and will stand an amount of pressure or concussion equal to 9in. bonded brickwork.

Partitions from 1in. to 3in. thick would be as strong as would be required. These slabs will also be found to form the best kind of roof yet invented, as they are impervious to rain or snow and not affected by heat or frost; the under surface is so finished as to form the ceiling. Entire houses can be built of these slabs, including cottages, agricultural buildings, colonial huts, military buildings. Temporary camps could be erected of them, taken down and stowed away until again required; a few soldiers could erect and take down a camp in a very short time, as the slabs are simply screwed together. The advantages in point of cost, as compared with other buildings, may be thus illustrated; a cottage of two rooms, minus windows, doors, and cupboards, but otherwise ready for finishing, may be supplied for £16.

The price of the slabs is from 2½d. per foot super. Nine feet by four feet is the size expected to be in demand, but ultimately many thousands of feet of slabbing, of that and other dimensions, will be prepared and be always ready for the requirements of builders. They can be made to order of any size, shape, or curve, and when fixed will neither warp nor crack; and, being put up in a perfectly dry state, dwellings constructed of them will be ready for use as soon as erected, which is not the case with other kinds of construction.

COMPETITION.

Mr. T. Oliver, architect, of Newcastle, has had awarded to him the first premium for his design for improving the parish church of Alston, Cumberland; Mr. T. C. Evely, architect, Durham, the second premium. The drawings are to be submitted to the "Incorporated Church Building Society," for final decision.

In consequence of the scarcity of good stock bricks—which is caused by the stoppage of water conveyance by canal, the water having been drained off in some places for cleansing purposes—the works in many large contracts have been much impeded; for instance, the erection of the model dwellings at Little Chelsea, Fulham-road, and the works of the extension of the Metropolitan Railway at the same place. Smaller jobs have also been delayed, to the disadvantage of the masters.

DISINFECTANTS.

WEATHER prophets prognosticate a hot and dry summer, and it becomes us, herefore, to look carefully to the fulfilment of all sanitary precautions for the prevention of fevers and other zymotic diseases. By no means the least of our precautions should be the liberal use of disinfectants; and, fortunately, the most efficacious of these stand ready to our hand, provided by nature, while others have been furnished by science. Cold, heat, and water, are the three great natural disinfectants. The first two of these, however, are independent of our control, and are, therefore, to a great extent useless. Water, in this part of the world at least, is always with us, and is the greatest, because the most manageable, agent of cleanliness and health. There was a deep meaning in the Greek mythology, which represented Hercules as using a river to wash away the filth of the Augæan stables. We need not, however, urge upon our readers the necessity of the free use of water, but its disinfecting action, although of great value, is not perfect and needs supplementing. Artificial disinfectants which destroy noxious substances are various. Those which destroy by oxidation are perhaps the most numerous. This is effected either by rapid combustion, by the natural action of the air (in reality slow combustion) or by chemical, sometimes aided by mechanical, agencies. A putrid or decaying body when so heated as to be deprived of all its volatile particles cannot any longer decompose. Acting on this principle the ancients burned their dead, and some have recommended its adoption as suitable for modern practice; but, apart from its repugnance to our moral sense, the immense quantity of gas arising from a dead body during combustion would seriously endanger the health of the living.

Manganates, or permanganates, are the most complete disinfectants; they not only rapidly destroy the odour of putrid matter, but they oxidise sulphuretted and phosphuretted hydrogen, as well as purely organic substances. They are the mildest form of destructive disinfectants, and their application to putrid liquids of every kind will give most satisfactory results. Only small quantities should be treated at a time, and only sufficient material used to stop the smell, or at least not much more, as the manganates are acted on both by pure and impure matter, and the material may be wastefully expended on that which is not at all hurtful.

Nitric oxide, the acting principle of Dr. Carmichael Smyth's disinfectant, is a very powerful oxidiser, and most rapidly destroys organic matter; and for cases in which gaseous fumigation is applicable, nothing can be better. No person, however, must be permitted to breathe it, and exposed metallic surfaces must be protected from its action by a coating of varnish. This was used with such good effect in ships and hospitals some years ago, that Parliament awarded a pension to Dr. C. Smyth for its application. Nitrous fumes are, however, on the whole, too dangerous for general use.

Chlorine is another powerful disinfectant. It is, however, unfitted for agricultural use, or where the offensive matter is to be retained for manure, as it destroys the ammonia, the most valuable and expensive part of any fertiliser. It is also open to other objections. As a liquid it acts too rapidly, and as a solid, in the form of chloride of lime, it soon attracts moisture and loses its power. It is also said to have aggravated and even increased cases of lung disease, when employed in hospitals at Paris. Still, as a disinfectant in cases of great impurity, it is very valuable.

Acids destroy putrefaction, but they cause the evolution of noxious and unwholesome gases. Muriatic acid, in great vogue at one time, is now entirely disused, and very properly, as its action, while offensive to the breath and destructive to many substances, is only indirect as a disinfectant. Vinegar, the old remedy of the plague doctors, is the best of acid disinfectants. Wood vinegar is the best, because it unites with its acidity a little creosote. Another ancient disinfectant is sulphur, used with presumedly good effect, according to Homer, by Ulysses when he had strewn the floor of his palace with the bodies of the suitors on his return from the Trojan war. Sulphurous acid and creosote have been united with good effect in "M'Dougall's disinfecting powder." Lime is valuable for the precipitation of sewage water, and it also absorbs sulphuretted hydrogen, but allows it gradually to pass off again. Charcoal and alum have been tried, but never on any great scale. Carbolic acid, a tar product, has been used with good results both at Carlisle and in London. Sir William Burnett's chloride of zinc is also very valuable, and has the advantage of being so soluble as to take up less room than many other disinfectants.

Some of the following are at once simple and efficacious for domestic use. A tea-cupfull of chloride of lime and a tea-cupfull of vitriol placed in a basin on the floor; a chemical action at once takes place, and the chlorine flying off in vapour fumigates every corner of the house. Birds, cats, and all domestic animals must be removed from within reach of its influence. Coffee is a good deodoriser. An iron shovel should be made red-hot, and just as it begins to cool a tea-spoonful of freshly-ground coffee thrown upon it. This may be carried about anywhere, in sick rooms, water-closets, cellars, or the like. Sulphate of iron, or copperas, may be effectively used, dissolved in water, in the proportion of one pound of copperas to four gallons of water. This, sprinkled over sinks, privies, or cellars, destroys all offensive smells. A small quantity of black oxide of manganese, and an equal proportion of spirits of salts put together in a teacup, and placed on a hot brick in the centre of the room; care must be taken to stir the same occasionally.

A liberal but not lavish use of any of these means is to be counselled. A little and often, rather than much at once, should be the rule. Above all, the value of the first-named should not be forgotten. In our moist climate the insides of houses, furniture, and household utensils become covered with a thin coating, which rapidly decomposes and gives off offensive fumes. This must be removed, and by nothing but water can it be removed so often and so well.

EXPERIMENT ON THE PURIFICATION OF SEWAGE.

AN interesting experiment on the purification of sewage was made on Tuesday, at the sewage works of the Tottenham Local Board of Health. In consequence of an injunction lately granted, which restrains the board from discharging the sewage of Tottenham any longer into the River Lea, a series of experiments was commenced with a view to the early adoption of the best mode of deodorising and purifying the liquid matter. The subject of Tuesday's experiment was a peculiar preparation of alum, patented by Mr. C. G. Lenk, of Dresden. The system hitherto adopted by the Tottenham authorities consists in the discharge of the sewage into a large tank about 50ft. long by 20ft. in width. Lime is thrown in, and the stuff is gradually allowed to settle until the solid parts sink to the bottom. The surplus fluid is then discharged into the river, and the residuum is utilised as manure. This mode has proved altogether inefficient. Not only does it render the manure comparatively valueless, but it does not destroy or mitigate the poisonous properties of the water discharged into the Lea. The consequence is that the board of health is deprived of a large income which might be employed for local improvements, and that the river is polluted so as occasionally to be a nuisance and a source of danger. Mr. Lenk's "Patent Essence," as it is termed, operates, according to the *Standard*, very differently. On Tuesday 26,000 gallons of sewage were discharged into the tank, and into this were gradually poured about sixty gallons of the "Patent Essence." At first the smell was most offensive and nearly intolerable, but as the chemical preparation mixed with the liquid the odour perceptibly decreased. After some time a remarkable change was visible in the contents of the tank. The solid substances were precipitated to the bottom, the water on the surface became gradually clear, and at the end of an hour it was found to be not only transparent, but almost clear, by contrast with its condition when discharged from the sewer. It is satisfactory to find that a chemical preparation has been discovered which is capable of rendering such useful service as a sanitary and economical agent. Mr. Leunig, who holds the English patent, is so confident of the purifying power of the fluid that he is ready to enter upon experiments on a far larger scale with a view to the possible solution of a problem which has long puzzled sanitarians.

LABOURERS' DWELLINGS.

AN application was made on behalf of the Metropolitan Board of Works for the magistrate's certificate, under somewhat novel circumstances:—It appeared that in 1866 the Legislature passed an Act of Parliament for the widening and improving of the High-street of Kensington, at the cost of the metropolis, and the 42nd clause, which was inserted at the instance of Lord Shaftesbury, provided that more than 15 houses occupied by the labouring classes should not be taken down without eight weeks' notice, by means of placards affixed on or within view of the premises. The object of the present application was to obtain possession of 16 houses occupied by the labouring classes, who would be entitled to compensation.

Mr. John Giotto, the Board's bailiff, proved seeing the printed placards affixed to the walls of the houses on the 29th of February last. Mr. Dayman looked at the 42nd clause, and found that before the Board could obtain possession of the houses a magistrate must certify that the notices or placards had been posted to his satisfaction. After hearing the evidence of the bailiff, he wrote out a certificate, which was annexed to a printed copy of the placard. A fee of 1s. was charged for the certificate.

TECHNICAL EDUCATION.

THE seventeenth annual conference between the council of the society and the representatives of the Institutions in Union and Local Boards will be held on Friday, the 19th June, at twelve o'clock noon. William Hawes, Esq., F.G.S., chairman of the council, will preside.

The council will lay before the conference the secretary's report of the proceedings of the union for the past year, and the results of the examinations; and the programme of examinations for 1869 will also be considered by the conference. The following suggestions of subjects for discussion have been received from various quarters, it being understood that in putting them forward the council express no opinion whatever upon them:—

1. How can the institutions best aid in the advancement of technical education?
2. Would it be desirable for the Society of Arts to promote the issue of a series of text-books in relation to technical education, especially suitable for working men?
3. How far can the society and the institutions cooperate with the Department of Science and Art, in carrying out the objects of Mr. Whitworth's munificent endowment?
4. What further efforts can be made by the Society of Arts to obtain the co-operation of other societies, and of the great public companies, in its educational movement?
5. How far is it possible to unite in one system, or to establish any connection between the various systems of examination which are now available for the working classes in different parts of the United Kingdom?
6. How can the society aid in promoting visits of working men to various foreign centres of industry?
7. How far would it be desirable for working men to take their holidays all at once rather than piecemeal?
8. What arrangements would enable the working classes to make more extended use of the public museums and galleries which may be available for their instruction and amusement?
9. Under what arrangements could collections of useful and interesting objects of art and nature be sent to country institutions in circulation from the metropolitan national museums?

The new theatre to be built upon the site of Lyon's Inn, by Mr. Sefton Parry, will, we believe, be called the "Royal Globe Theatre," and it will open some time in October. The works were begun on Monday, and the house will be of the second or third class size, capable of seating about 1,400 people.

WHAT IS ART MANUFACTURE?

NOTHING is more surprising in an old-fashioned country than the adherence to names and forms after such names and forms have ceased to have any meaning, or, at least, have ceased to retain the meaning and significance they at first had. Words and names are not the least of the curious things that exist for a time and then for ever pass away; we are told that no language lasts for more than a thousand years, and it is quite certain that if Chaucer were alive now no one could understand his talk. But not only do words pass away altogether, but they change their meaning and sometimes contradict themselves. There are, as all know, not a few curious instances of this, as in the word "prevent," to go before—now, to stop or hinder. But one of the most curious of them all—and which I never saw anywhere noticed—is the one at the head of this paper, viz., the word "*manufacture*," including both the word itself and the thing signified by it. May we not say that what is called civilisation itself is wrapped up in it, so that it is worth a passing notice?

The word "manufacture," then, from the Latin *manus* and *facto*, *hand-made*, or to make or fashion by hand, was defined by Johnson "to make by art, to make by hand," and a manufacturer, "an artificer or workman," so that the word in his day was understood to imply that to manufacture was to form or make by hand, art, or by skilful manipulation. Thus Sir Joshua Reynolds would not have felt offence had he been told by the great dictionary maker that his last portrait was capitally "manufactured," as implying how well it was painted; but if the present president of the Royal Academy were to hear such a remark as applied to a portrait of his own, it is but too probable that he would consider it as a studied insult. It would mean that the person so making it considered the said painting to be the result, not of the hand skill of the painter, but the result of some unseen assistance, and that not one but several hands had been employed in its production. A modern painter must feel offence, and justly, at such a remark, and the reason is that the original meaning of the word is entirely changed; that it does not now mean that one pair of skilful hands have produced a fine result, but that a *number*—sometimes ten or twenty, or more—have assisted to produce it. Manufacture is not now "hand" work but "hands" work: the art element is gone, as we shall see.

If a painting, or even a note, an autograph, or a coin or medal, were in Johnson's time good instances of manufacture and examples of individual hand skilfulness we shall not be far wrong if we take an *envelope* as it was made when first brought into use as an equally good instance of "manufacture" in those days. The paper was at first cut by hand, and folded by hand, and the adhesive gum put on by hand, and the seal impression stamped by hand, so that by passing from one person to another the perfect envelope was produced. All this is now done by a machine, and an envelope is said to be manufactured, though the *hand* never touches it from first to last. But the point to be noted in all this is that the hand skill capable of being called into exercise by one person in the manufacture of an envelope is here seen to be distributed among many, so that it cannot be said that one of these useful pieces of folded paper is the work of a "manufacturer" or skilful workman. Let it here be observed that it is probably in the nature of things, and pre-ordained, that all such work as this and all else wherein a constant repetition of the same simple art as the folding sheets of paper and then stamping them, will pass in time, and as machinery improves, entirely from the hands of human and intelligent beings to that of the insensible machine. Nails, pins, beads, and a thousand other things are fast passing away from human hands, and are becoming the work of the almost living machine. Every part of an envelope is, and can be, made as well by a machine as by the most skilful hand, but one thing only in it is beyond the power of machinery and modern manufacture through a series of hands—viz., the *die* from which the seal is impressed. This is the work of the individual and the artist, and might have been "manufactured," as a work of art, in the old and forgotten sense of the word, but cannot be "manufactured" now, in the present sense of the word, as a work of art. Seal engraving is a fine art, and cannot be done by passing the die from one to another, any more than a picture can be painted by such a process. What is here said about envelopes applies equally to a far more important subject of modern manufacture—the coinage. Coins were at first manufactured entirely by hand, and the rudest Saxon one of them was a work of art, though so rude and rough. Even the "head" on it possessed character, and professed, at least, to be the *likeness* of the reigning sovereign. It is perfectly legitimate and in the course of things that our present coins in such vast numbers should be manufactured by complicated machinery by thousands at a time, instead of one by one as they were at first; but it is hardly fair that the *die* from which they are struck should go through the same process, and that the head on the penny-piece should represent nobody, and that the figure on the other side of it so badly that it would not be thought good enough for the sign of the "Britannia" public house. In the days of good Queen Bess art had not reached its present advanced state, there were no art schools, but they managed in those dark days to engrave a magnificent portrait of that vigorous queen; why, then, should we fail so utterly now-a-days? The fact is, and this is the point to note, the idea of manufacture, as it is now understood, has passed almost entirely from the envelope and the coin; the mere making of the coin, to the *art* in it, the die-cutting; and, as the envelope and the coin are cut, folded, and struck off, so is the die cut—anyhow.

But not only has the word and the subject of manufacture changed, but that change has necessitated the employment and invention of a new word to express the change that has taken place. Manufacture in its first sense has yet to come again, for it is simply art as produced by individuality of work, as in painting; but manufacture as it is now understood is fast passing from the region of workmen to the machine; the business of the workmen being merely to stand by and watch its working. A new word is wanted to express this wonderful idea, that of the almost self-conscious living power of the machine. "Machine-facture" is a long word, but it perfectly expresses the idea—that of the production of a work, as an envelope, or a coin, by the simple and sole power of machinery. It is no false exaggeration to say that a man may drop into a trough at one end of a long room a bundle of rags, and passing to the other end, may get back his bundle in the form of paper envelopes ready for use and the post office, without the human hand ever touching either rags or paper. This tremendous living power of machinery in modern days is more surprising than anything in antique Eastern fable, but it may well be doubted whether the mental if not bodily gain was not greater in those days than in ours, for the very absence of the machine compelled the use of the hand, and art was consequently the inevitable result. Manufacture and machinery, by travelling beyond their legitimate and proper place and action, have destroyed art, by taking it out of the hand of the individual artist, and have either given it to many workmen, acting successively, and so destroying each other's work and individual impression both manually and mentally; or they have put the work wholly and passively into the power of a machine. The first of these disastrous consequences may be seen in the production of a painted glass window—the work of a succession of hands; there is and cannot be any *handwriting* on such work, for one workman obliterates what his fellow workman has just done precisely in the same way as the genuineness of a letter would be destroyed by the writing over it with a fresh pen by another hand. It may be seen, too, in modern engraving, where half the work is done by a ruling machine. The only part of a modern engraving of the slightest artistic value is the preparatory *etching*; the engraving simply destroys this, and obliterates the art hand-writing as seen in it. It is a phase of modern manufacture, and a truly unfortunate one. Let it here be thoroughly understood that no objection is being made, even were it possible, to manufacture in its proper and honest sense, as a means of doing a vast quantity of necessary work in the shortest and easiest possible way. Miles of cloth and calico, and millions of nails and needles, can only be produced by machinery and manufacture. Like envelopes they are utterly beyond the power of production, one by one, nor is it necessary that they should be produced singly and by hand. Art may be multiplied by manufacture and machinery, but it cannot be created by them. The die for a coin must be cut by hands, as a picture is painted by hands, but it may and must be made to multiply the coins impressed from it through manufacture and machinery—*i.e.*, by the division of labour and the coining press.

Thus it will be seen that this vital and interesting subject of art action, and the words which express it, have changed in these modern days in a way not a little remarkable. The word "manufacture" and the thing signified by it have come to be so altered from what they at first meant, that their meaning and intention are now completely reversed. Not only is this so, but the very word "manufacture" must cease to have a meaning at all, for some other word or phrase—as the one we have ventured to suggest *machine-facture*, or some other, will doubtless come into use to express perfectly the new idea, unknown to antiquity, that of the production of an object solely by machinery. This word, then, to express the multiplication of objects or art objects by machinery, would seem to necessitate the use of another word of equally significant and accurately descriptive import to express the idea of art production by the hand of the individual artist and workman, and I can think of no better one than "art handwriting." It is thoroughly descriptive and explains itself, and means simply that, as in a common note, the artistic faculty in a man can only find expression through himself and through his own mind and hand. I hope to develope this more at length. The painter *writes* on canvas. The sculptor writes on stone. *No other hands can do these for them.* "Art handwriting" expresses both personality and individuality, the primitive and foundational ideas of art action in nature.

C. B. A.

In consequence of the death of the Rev. Pierce Butler, the arrangements for the survey of Mount Sinai, which it was proposed should be made by an officer and party of Royal Engineers from the Ordnance Survey, under the direction of Colonel Sir Henry James, R.E., were necessarily suspended. The Rev. H. G. Williams and the Rev. F. Holland have now offered to assist in the undertaking, in conjunction with Sir John Herschel, Sir Roderick Murchison, and Sir Henry James, the trustees of the fund; and if a sufficient sum is raised by subscription to defray the cost of the survey, Sir John Pakington, Secretary of State for War, has given his consent to allow the party of engineers to undertake this survey, and to go out for the purpose in October next. The estimated cost of the survey is £1,220.

BURLINGTON HOUSE COLONNADE.

ON Friday evening last, Mr. Beresford Hope called attention to the proposed demolition of the colonnade of Burlington House. It was announced in an advertisement that the "valuable materials of the colonnade, with Doric columns and frieze," were to be sold, and Mr. Hope deprecated the idea of "knocking-down to the highest bidder such an interesting specimen of architecture of the last century." As it was to be removed, he thought that the Government should re-erect the colonnade and portico in one of the public parks or gardens—at Kew, or South Kensington, or Kensington Gardens. There can be no question that the colonnade where it is possesses all the charms which Mr. Hope enumerates; but, if it were removed to either of the places mentioned by him, unless it were made the entrance to some public building, or park, or garden, it would be something like a fish out of water. One correspondent says that, with a trifling expense, the colonnade might be made "an ornament to the metropolis—in fact, a miniature piazza of St. Peter's." He does not say, however, where it shall be put up. Another correspondent is more precise. He suggests that the gateway be re-erected at one of the entrances to Kensington Gardens; and the colonnade re-adapted as a termination to one of the main walks of the same gardens," where it would form a most convenient and appropriate resting-place for the public, and a refuge from the rain." No doubt nursery-maids would be much obliged to the Government for such a privilege. As it is determined to remove the colonnade, as it is a unique specimen of architecture, well worthy of preservation, and as it may be preserved on some other site by a trifling expenditure of money, let us hope it will not be utterly destroyed. The Government, through Lord John Manners, announced, on Tuesday evening last, that it shall not be submitted to public auction.

THE APPLICATION OF TOWN SEWAGE.

MR. THOMAS CARGILL, C.E., who has paid much attention to town sewage and the best modes of applying it to general farm crops, read a paper on the question before a meeting of the Farmers' Club, at Maidstone, on the 20th ult. We have only room for the following portion of this exhaustive paper:—

Admitting the practicability of applying sewage to every possible description of soil, with nearly equally good results, it is still evident that the management must be varied to suit the particular nature of it. A much larger quantity of sewage may be applied in the case of light, porous, gravelly soils than upon stiff clays, particularly during the first year of the application. It would appear that gravelly soils require a certain time to become thoroughly saturated with the sewage, and absorb it greedily while the operation is in progress. This fact is corroborated by the experience acquired at Barking. When the sewage was first brought on to the land an enormous quantity of it went to waste in the carriers, which, being cut in the gravelly soil, absorbed it with extreme rapidity. The settling tank was, in consequence, not used for a long time, in order to allow the sewage to carry as much mud along with it as possible, and, by depositing it in the carriers, render them ultimately water-tight, which appears now to be the case. The practical lesson to be learnt from this is that if the supply of sewage was very limited, and the ground of an exceedingly porous nature, it might be worth while to make the carriers water-tight by puddling them, or by other means. During the winter time, when the crops are stationary, stiff soils probably retain the fertilising constituents of the sewage better than the lighter descriptions of land. With all crops of a rapid growth, as grass, which quickly assimilate the elements they require from the soil, the character of it is not of much consequence. Three different descriptions of soil are sewaged at Croydon with much success. One is a sandy, gravelly soil; another gravelly mixed with loam; and the other a stiff clayey one.

The question of the proportion of land to be sewaged by a given population, however interesting it may be to local boards, does not much concern the farmer, but it may be generally accepted as a good practical estimate that one acre of ground will require the sewage of one hundred persons to yield annually forty tons of grass. The application annually of 5,000 tons of sewage per acre is calculated to give a certain average return of thirty tons of grass. This quantity is sufficient to supply all the potash needed by the plant, without taking any from the soil, but if the latter be rich in potash a less amount of sewage will suffice. It is impossible to state, with respect to grass crops, the exact limit at which the application of sewage ceases to give a productive return. Between 5,000 and 6,000 tons is the most profitable quantity under all circumstances to apply annually per acre, but at Edinburgh over 8,000 tons is the usual allowance. One point is very certain, that is, that after a given quantity of sewage has been applied the application of more is not attended with a proportionate increase in the result.

There are three principal methods of actually applying the sewage to the land, known respectively as the hose and jet system, the method of sub-irrigation, and the method of surface channels. There is a fourth plan of irrigation, by total submersion, or literally laying the land for a certain time under water. This is practised in Piedmont and other continental districts, but as it is not applicable as a rule to sewage I need not discuss it. In describing these different methods the sewage is supposed to be brought upon the farm ready to be distributed. The means of conveying it, whether by pumping or by gravitation, are connected with questions of engineering works and estimates which would be out of place for me now to allude to. To commence with the hose and jet system. Small pipes are first laid down, through which the sewage must be forced. To accomplish this it is necessary to have a certain head of water, not less than about 10ft, which entails a great waste of power, consumed in not only overcoming the friction of the pipes, but also in imparting the requisite momentum to the jet. By this system the sewage must always be raised a few feet higher than the level of the land, a disadvantage not occurring in either of the other two methods. The hose and jet plan can be applied to land of any form of surface without the necessity of any especial preparation or laying out in beds. But as a balance against this advantage must be set the cost of the piping, hydrants, and other appliances, which will exceed that of the preparation of the ground for the application of the other principle. On the farms of Alderman Mechi and Mr. Neilson the hose and jet system has had a partial success, but then it must be remembered that town sewage is not used, but liquid manure, which is a much stronger and more concentrated fertiliser than the former. Moreover, at these two places ordinary farm manuring is carried on as well. The dragging of a long length of hose among crops is a troublesome and tedious operation, to call it nothing worse, and grass could not well be sewaged in this manner, except during the early stages of its growth, which would not suffice to produce the splendid annual crops which have been obtained at Edinburgh and Barking. In the best seasons at Edinburgh so much as eighty tons of meadow grass have been got off one acre, which was sold for £35. The utility of this method is very much impaired by the restrictions imposed upon it with respect to time, since one of the most important features of the application of sewage is that it should be able to be applied at any and at all times, in the day-time as well as the night-time, and at any stage of the growth of the crop. Objections have been taken to the fact that the distributing of the sewage over the crop, instead of applying it direct to the roots, is wrong in principle, and that a deposit is thereby left upon the leaves and those portions of the plant above ground, exceedingly injurious to its growth.

At Rugby, Alnwick, Watford, and other localities, the hose and jet method has totally failed. Mr. Rawlinson, the well-known commissioner of sewers, has stated that it would cost more to distribute 500 tons of sewage per acre by means of this method than to apply 5,000 tons by the system of surface channels.

The second method, namely, that of sub-irrigation, has not been practically tried except on a very small scale, as it is not only a very expensive plan, but also promises little hope of being successful. It consists in laying down below the top soil porous or perforated pipes, the ends of which can be closed when required, and the sewage forced through the pipes into the soil. Now it will be at once apparent that as the pipes must be laid at such a depth as to be out of the reach of the plough and other tillage implements the plants scarcely derive the full benefit that they ought to from the sewage, more particularly as it is distributed very slowly, and is in some danger of complete stagnation in the interior of the pipes, owing to the stopping up of the holes by solid deposits. It is not by any means clearly established how these underground pipes act, or whether a portion of the sewage does not drain away from them instead of rising to the level of the roots of the plant, in which case the waste might be very great. Under certain conditions the pipes used for ordinary subsoil drainage may be made to answer the purpose of this system by merely stopping up their outlets during the season of irrigation. This plan has been adopted in Switzerland and a few other places.

Of the three methods, that of surface channels is the only one which has been attended with undoubted success, and as it is the one I should recommend to be adopted I shall describe it more in detail. It is the only principle applicable upon a large scale to sewage irrigation, and fitted to contend with the difficulties that have to be encountered. It may be subdivided into three distinct kinds, namely the catch-water, or catch-work plan, the pane and gutter, and the ridge and furrow. All of these are distinguished by their simplicity and efficiency, and the adoption of one or other depends upon the physical features of the ground. The catch-work plan is best adapted in the case of steep or even hilly grounds, and is the cheapest mode of applying sewage. The ground having been first carefully levelled over, or contoured, as it is technically termed, gutters or carriers are cut along the contour lines at convenient distances from the top to the bottom of the field. These carriers are cut transversely to the slope of the ground and are perfectly level in the direction of their length. The sewage being brought into the uppermost carrier fills it, and then flows over the edges on to the land into the lower carrier, and so on until it reaches the lowest one, which conveys it away to the outlet.

A MARBLE RESTAURANT.

A NEW restaurant, of more than ordinary pretensions, to be known as the "Westbourne," has just been opened in Spring-street, Paddington, opposite the departure entrance of the Great Western Railway. The building is entirely constructed of different kinds of marble. The wall, in rear of the bar, is covered with coloured marbles of the choicest description. The pilasters, which divide this wall into panels or mirrors, are of Spanish jasper marble, with bronze bases and capitals, the whole resting upon a ground of green marble, illuminated with incised lines of gold. Supported by the capitals runs a frieze of bright jasper, with inlaid panels of Vert des Alpes marble, and above this is a bold and massive cornice, carved in figured Bardilla marble, from the centre of which rises an elegant entablature, bearing the name of the proprietor. This entablature is executed in Bardilla and jasper, with panels of Genoa green marbles. At each end of the cornice is arranged a circular pediment, the striking effect of which is heightened by some elaborately carved festoons of flowers in high relief on a rich red ground. The counter or bar is constructed entirely of marble. The plinth, standing upon a tesselated pavement, is of speckled Coquille, and the moulded base of Bardilla marble. The pilasters are of jasper, out of which in the solid block have been wrought circular niches for the reception of bronze figures supporting the cornice. The panels separating these figures are of black marble, inlaid with green and jasper marbles of alternate designs. The frieze or upper part of the panel is also of black marble, relieved by finely cut gilded lines. The cornice is of Bardilla marble, and the counter top of long slabs of the same material, with which correspond the tables and other fittings. The whole of the marble work is polished. It has been executed by Messrs. W. H. Burke and Company, of Warwick House, Regent street, under the direction of the architect, Mr. A. Evers, of Great Marlborough-street.

THE NEW LAW COURTS AND THE NATIONAL GALLERY.

WE suppose the vexed question of the Law Courts is settled at last. No competition of modern times has excited half as much interest as this one. The character and dimensions of the work, the number and reputation of the architects invited to compete, invested the matter with an unusual interest. After much discussion and long delay the judges gave their award, but, instead of selecting as the best the design of one of the architects, two architects were selected—the one for his architecture, and the other for his plan. In this there was manifest unfairness; and the other competitors naturally enough demurred. It was contrary to the conditions that two architects should be jointly chosen to superintend the production of the great national work. Mr. Street and Mr. E. W. Barry were scarcely the two men to be yoked together. In fact, two men more unsuitable for joint action in such a matter could scarcely be selected. Besides, this decision was made in the face of the recommendation of the committee of barristers and solicitors. It was known from the commencement that Mr. Waterhouse had highly satisfied the judges and barristers by his Assize Courts at Manchester, and their committee almost unanimously pointed out the superiority of Mr. Waterhouse's plans. So the matter was brought to something like a dead lock, and so it remained up to the beginning of last week. A fortnight since Mr. Baillie Cochrane brought the question before the attention of the House of Commons by suggesting that the site intended for the new Courts should be abandoned, and that they should be erected on the Thames embankment. He and Mr. Montague Chambers, who followed him, gave good reasons for this change of site. It was, they said, more commanding, more level, less expensive, and more convenient. It was urged that the site was not thought of, because it did not exist at the time it was decided to erect the Law Courts in the Strand. On æsthetic grounds there is much to be said in favour of rearing a magnificent building on the banks of the Thames. But it having been decided by the Legislature, after many discussions and mature consideration, that the Strand site was the best—after the houses had been cleared away and hundreds of people had been turned adrift—after £789,000 had been paid for the site and in compensation to persons inhabiting dwellings thereon, it was not likely that a new site would be chosen. We do not, however, complain of Mr. Cochrane for introducing the question. Possibly he hastened the decision, which will no doubt be acted on.

The matter, as we said, having been brought to something like a dead lock, it was necessary that something should be done to save the credit of all parties. How, then, was the knotty point to be solved, so as to give the least disappointment? Messrs. Street and Barry could not be selected without violating the spirit and form of the original conditions. Some one therefore judiciously hit on the happy thought of giving the Law Courts to Mr. Street, and the National Gallery to Mr. Barry. It will be remembered that a limited competition for a new National Gallery was invited almost simultaneously with that of the Law Courts, and that Mr. Street and Mr. Barry were competitors in each. The National Gallery designs as a whole, though eight distinguished architects entered the field, were considered unsatisfactory, so much so, in fact, that it was supposed that neither of them would be selected. So long a time had elapsed since the designs were submitted, and nothing having been done, everyone looked on the competition as barren of results. It now turns out differently. Mr. Street is to have the Law Courts, and Mr. Barry is to have the National Gallery, and so the matter is settled by a cunning and, let us hope, a satisfactory compromise. Such an arrangement is a happy stroke of diplomacy. It is worthy of the Prime Minister himself, though he is so busily employed in mesmerising his party in the House of Commons that we can scarcely expect that he has inspired Lord John Manners.
